At a meeting of the board of directors of the Columbus (O.) Edison Electric Lighting Company, the regular quarterly dividend of 1¼ per cent. was declared on the common stock of the company, payable June 1. The books will close May 20.

August Belmont, president of the Interborough Rapid Transit Company of New York, said that the proceeds of the $10,000,000 short time notes sold by the company to a syndicate last week, as reported in ELECTRICITY, are to be used for the payment of equipment and extensions.

The General Public Service Corporation and the Universal Service Company, two corporations formed for supplying gas and electricity for light, heat and power purposes in the cities and towns of the State of New York, were incorporated at Albany on Friday with capitalizations of $2,000,000 and $100,000, respectively.

Stockholders of the Twin City Rapid Transit Company are asked to approve the action taken by the directors May 5 looking to an increase in the common stock of $5,000,000. It is explained in the circular that in order to amend the certificate of incorporation it will be necessary that two-thirds of each class of stockholders assent to the proposed amendments, and for the purpose of voting on them a special meeting of the stockholders will be held at the company's office in Elizabeth, N. J., on May 31.

EDITORIAL NOTES.

What Tunneling Owes to Electricity.

American enterprise is directing much of its energy in the construction of tunnels. It has taken many years for us to awaken from the conservatism and lethargy into which we had fallen with respect to our transit facilities. Since the awakening, however, a remarkable change of opinion has been observed. The horror of traveling through tunnels, felt by many, whose impressions of them were based mainly upon those observed in England, has passed away. If anything can be stated in this respect, it is that the people of Greater New York are now clamoring for them. A sudden change of attitude like this is well worthy of a moment's consideration. The tunnel problem has been one of ventilation as well as construction. The modern appliances now in use permit not only of rapid excavations, but of construction that is beyond criticism. The difficulty remaining was that of ventilation. All who have passed through tunnels connected with our steam lines remember the unpleasantness associated with that part of the road. The necessity for closing windows to shut out the foul air; and in summer, the stifling heat, that thus resulted. Vivid experiences of a personal nature are rarely forgotten, and for this reason, tunnels in our country were considered as part of the necessary unpleasantness of travel. The apparent lethargy was more an active distaste from this point of view. Since the electric car has been brought to its present magnificent point of perfection, the problem has been successfully solved. All honor to the mechanical and civil engineer in their admirable work in this respect. Their honors, however, are only possible through the use of electricity. The situation to-day can only be clearly understood by a keen remembrance of what tunneling owes to this strange force—electricity.

* * *

A Revival of Interest in Electric Lighting.

Electric lighting embraces great fields of activity. It is the influence through which the waterfall, the tide, the waves and the wind have been harnessed. Through it, the mining of coal has been greatly increased. It has become, in a sense, a national industry.

An unusual revival of interest in electric lighting has recently taken place, due to certain innovations now in contemplation. An examination of the situation discloses the strange fact, that the mechanism of the electric light station is undergoing radical changes. Various influences have been co-operating to produce this effect. In the first place, the ground space in cities is increasingly expensive, and in consequence engines occupying a large number of square feet are a source of annual expense not at all compensated for by their other qualifications. The boiler room must of necessity be contracted to meet with this new condition of affairs, and it is obvious that the only outlet in this respect is that of raising the pressure within them. Thus it is seen that floor space being expensive, has led to the installation of vertically mounted in preference to horizontal engines and high pressure in preference to low pressure boilers. A well-known consulting engineer in commenting upon the situation said: "The architects who have been laying out the building requirements of electric light stations are surprised at the changes that have been introduced lately." A few years from now, and this new and present revival will have been the means of creating a new and distinct departure in this field. Many things are hanging fire at present, not the least of which is the ultimate design of our most modern electric light stations.

* * *

The Education of an Electrical Engineer.

Considerable has been written from time to time as to the methods that should be adopted in training would-be electrical engineers. Some experts advocate one method, some another. In a recent issue of the "Electrical Magazine," Mr. H. H. Broughton suggests a system which would seem to have much to recommend it. His plan is to send the men into the works directly after they have completed their elementary education—say, at fifteen years of age, and keep them there for three years, working 50 or even 60 hours per week. At the end of this time college-train them for three years, and then finish off their education with another year in the works. The advantages of this system over the others are: That a man goes to college with a very fair knowledge of practice; he is conversant with the various processes; he knows something about the properties of materials and machines; and, further, he is fully alive to what will be expected of him when he rubs shoulders with the world. That the men start studying for their profession at an age when they are most capable of doing so, and when they realize the hard grinding work necessary to make a successful career, are in themselves sufficient recommendations for the system. As to the colleges, in the first place, every professor in an engineering department should be a practical engineer, or at any rate should be conversant with the needs of the engineer—particularly the lecturers on chemistry, physics and mathematics, above all. If the mathematicians would base their lectures to engineering students on practical problems, our colleges would pour into the country men armed with the tools necessary for tackling any problem they are likely to come across in their everyday work.

Unfortunately very few professors are practical men. Many of them may have been practical at one time, but years devoted to teaching has necessarily made them theoretical. And that such is the case, is not to be wondered at, in view of the fact that an up-to-date engineer, thoroughly conversant with practice and theory, can earn a year at least several times the salary usually paid to a professor.

UNDER THE SEARCHLIGHT.

Notes and Comments on Various Topics.

New York City has purchased three sites for electric plants, two in Long Island City, and one in Manhattan. These plants are not intended to supply private consumers.

The delegates to the International Railway Congress on the short tour were the guests of officials of the General Electric and American Locomotive Companies in Schenectady, N. Y., on Saturday. A series of tests of the New York Central's electric locomotive No. 6,000 were made.

A series of 10,800 photographs of the New York Subway in operation between 14th and 42d streets was taken Sunday noon with the aid of a battery of Cooper-Hewitt electric lamps, powerful enough to light a city of 50,000 inhabitants. But 12 minutes were required and more light was crowded into the tunnel than ever before was confined in like space. The pictures are for the private use of August Belmont and will be placed in his home.

Three of Nikola Tesla's patents covering the alternating current motor expired May 1. Referring to the subject, Mr. Tesla is reported as saying: "Three-fourths of the electrical business of the world is based on the three patents that have expired. Seven or eight years of the time of the patents were wasted before I could get the world to appreciate their importance. Since I secured them I have obtained 36 or 40 other patents along the same general lines, and many of these patents are still running."

Operating tests of the new electrical equipment of the Long Island Railroad were made last week along the 5-mile stretch of track between Aqueduct and Hammels, on the Rockaway Beach division. The third-rail is equipped with a wooden guard, and in addition third-rail sections are inclosed with picket fences. Elaborate new cattle guards have been provided. All the third-rail has now been laid, save a section of somewhat more than a mile along Atlantic avenue, and it is expected that passengers will be carried by electric trains by June 15.

A special to the "New York Times," from Denver, Col., May 20, says: "What is regarded as the richest known deposit of pitchblende, from which radium is obtained, has been discovered in Colorado. L. G. Nesmith, a mine worker is the owner. The value of the pitchblende is $2 a pound. Up to this time pitchblende has been found in crevices in rocks, scarcely thicker than a knifeblade, but Mr. Nesmith has followed his vein until he has found a large body of the ore. During a recent visit in Denver he exhibited a piece said to be the largest in the world. He has made one shipment to Germany, and will soon go there with a large lot."

In a paper recently presented before the International Railway Congress at Washington, Mr. Canovias of the Hungarian State Railways gave it as his opinion that electricity was the best illuminant for railway trains.

A skillful motorman, says our London namesake, can often save a considerable amount of power by taking advantage of down-grades and using the current judiciously. Generally speaking, it is the man who runs most of the distance with the controller at the "off" position who uses least current. When starting the car the power should be turned on so as to produce a strong, even pull until half speed or full speed is reached. To linger on the resistance points spells waste, and to force the motors to work much above their rated horse power also means loss.

A dispatch from Richmond, Ind., says that official confirmation was given there Saturday to the report that a merger practically has been completed for traction lines between Columbus, O., and Indianapolis, and that through dining and sleeping car service will be introduced. This is the first important step in a traction system that is to connect Pittsburg and St. Louis. It is being promoted by the Widener-Elkins syndicate of Philadelphia, which is investing millions in traction property in the Central West.

The 251st meeting of the New York Electrical Society will be held at the American Institute, 19 West 44th street, New York, Wednesday May 24, at 8 P.M. Mr. Charles A. Mudge, formerly chief engineer of the Railway Department of the A. E. G., Berlin, who took part in the tests on the famous Berlin-Zossen road, will lecture on "High Speed, Long Distance Electric Traction." At this juncture, when the conversion of steam railroads to electricity is commanding the anxious attention of the mechanical world, this lecture is fraught with unusual importance and is most timely.

ELECTRIC TRACTION IN SWITZERLAND.

BY EMILE GUARINI.

"Lives there a man with soul so dead" who, when conjuring up mental visions of the magnificent scenery of Switzerland, has not dreamed of one day visiting this corner of our globe where Nature seems to have collected together and concentrated a certain percentage of all those beauties which she has scattered lavishly throughout the various countries of the world?

He who has once seen Switzerland may claim to have seen practically the whole world in miniature displayed in an elegant manner which has a charm all its own, due to the vivid and clearly defined aspects that present themselves to him in such rapid succession that the variety presented recalls the passing of a panorama—in a word such an experience crowds all the pleasures of a lifetime into one brief hour.

Of all places in Switzerland Gruyere may, beyond all doubt, be ranked as one of the most beautiful, and it is a haven of refuge to the tourists in search of tranquility and pleasure; that its verdant and peaceful pastures have not been more visited by travelers is due, in the writer's opinion, to the long felt want of some really practical means of communication.

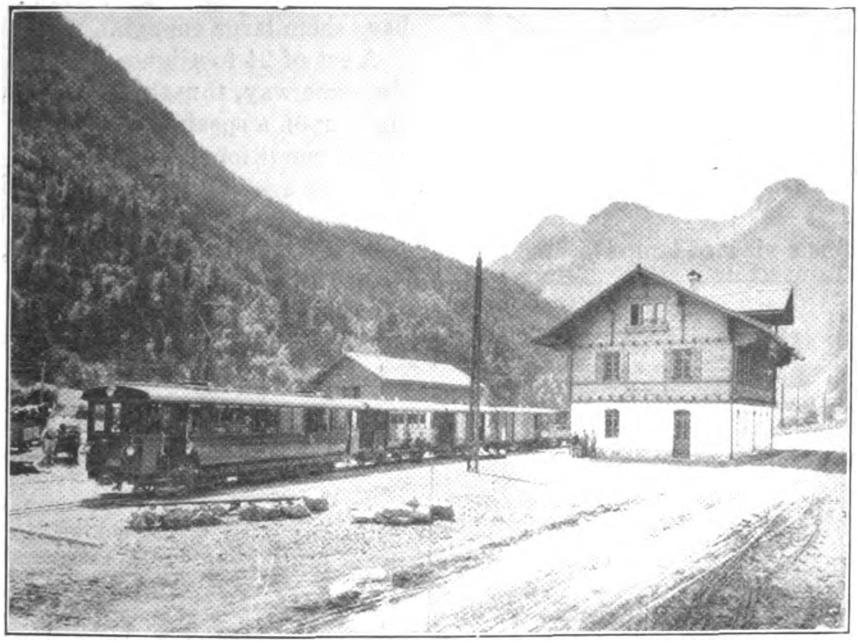
At the present moment only one line of electric railway traverses Gruyere; this line, of recent creation, is about 46.608 km. long and runs between Montbovon and Palezieux; the line, which winds through hilly country, passes through Albeuve, Grandvillard, Gruyere, Bulle, Semsales, Chatel-St. Denis, etc.

Montbovon, one of the termini, possesses as every one is aware an electric station for the supply of the necessary current to the electric railway service.

Like many other similar establishments in Switzerland, the Montbovon station uses as motive force the energy locked up in waterfalls, etc.; in this case it is derived from the River Saane, a tributary of the Rhine, which traverses the canton of Fribourg, passing through Grandvillard, Gruyere, Bulle and Fribourg.

As far as Bulle the line follows the course of the Saane almost entirely; at Bulle the track, which is generally single, trends to the southwest en route to Palezieux passing, as already stated, through Chatel-St. Denis.

The Montbovon station generates current at a high voltage which has to be reduced to a lower value. The transformation is carried out at Chatel-St. Denis, Bulle, Semsales and Albeuve, where there are located substations. At these substations we find special apparatus that receive the high tension currents and reduce them to a lower potential, under which form the energy is used for driving the electromotors which, as far as they themselves are concerned, drive the continuous current generators, the current from which is dispatched to the overhead copper wire that supplies it to the cars.



Montbovon Electric Station.

For this purpose these latter are fitted on top with a strong loop, the top part of which is formed by a bar of aluminum; this constitutes the bow or yoke that is held in contact with the line by means of springs for the purpose of conducting the current to the motors, as each car is fitted with four of them of greater or lesser power. With these various combinations of connections may be realized by means of the regulator or controller which the driver operates so as to render the consumption as low as possible.

Electricity is also used for lighting and heating the cars, and likewise for driving a small electric motor working a pneumatic engine that is used for braking purposes.

After having played its part in the cars the electricity returns to the generators; it makes or completes its circuit across the rails of the track and in order that it may not meet too high a resistance therein (all resistance being equivalent to a loss) the sections are all electrically connected by a special process.

As regards the contact or overhead wire it is suspended from brackets mounted on poles or from wires stretched between double poles or else fixed by means of insulators intended to arrest the vibrations passing over the wire.

If the extent of the work necessitated by the construction of an urban line of railway be borne in mind, then some conception can be formed of the difficulties presented by such an undertaking in such a hilly country as that of which we are speaking.

In such a case success can only be realized after long and exhaustive study. Too pronounced declivities must be avoided, all obstacles must be circumvented, rivers must be crossed and—in the present case—the gradients permitted were not to exceed 32.1 per cent., i.e., 32 m. per thousand meters.

Trains of 47, 60 and 130 tons circulate regularly at a speed of 17.20 km. per hour over the steepest gradients; they are composed of a motor vehicle to which the passenger cars are coupled as occasion may require.

The traveler is transported through magnificent scenery; on the one hand he sees rich valleys clothed with luxuriant verdure; on the other hand the line runs along a wood of sombre pines; further on he sees a lake of limpid water, the banks of which are romantic in their beauty; then upon the flanks of a mountain cosy villages peep out from amidst the trees whilst, towards the distant horizon, the eye is caught by some distant lofty snow-capped mountain.

In this way fresh scenes and pastures now are being opened up for the tourist—scenes which were hitherto inaccessible to him for lack of the necessary means of transport.

Lord Kelvin Recovering.

The health of Lord Kelvin is much improved and he was expecting to be able to leave London shortly for a change of air.

LIGHTING AN ASSEMBLY ROOM.

ARTICLE II.

BY W. H. WAKEMAN.

(*Concluded.*)

In this assembly room a gallery extends from side to side across the rear which covers nearly one-half of the seats on the lower floor. As no windows admit light to this part artificial light is always needed to make it compare favorably with other parts of the room. This is true of days when the sun shines brightly, therefore three groups of lamps are located here, as shown in Fig. 4, which is the ceiling as it appears from floor under the gallery.

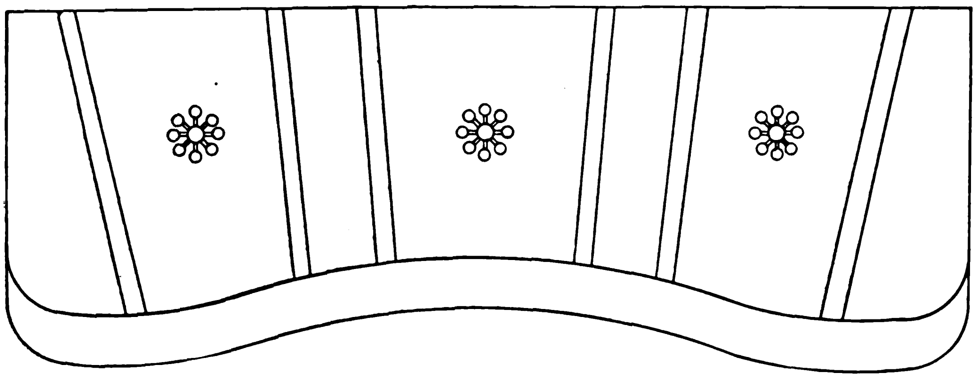


FIG. 4.

These are on one circuit, therefore the switch is kept thrown in so that whenever this room is used by throwing in the main switch these lamps give out a cheerful light. If it is in the daytime no others are wanted except where a stereopticon is used, therefore it is not necessary to go into the room for this purpose. When it is used in the evening for an illustrated lecture all overhead lamps are lighted until less light is wanted, when all but those shown in Fig. 4 are turned off. These are retained because they are not near enough to the stage to be detrimental, and it is not always wise to completely darken a room filled with young people, as it is a temptation to play pranks on each other that are not always agreeable.

On such occasions I have always turned off the lights promptly on the signal being given for this purpose, and turned them on equally prompt at the close of lecture, as this is an important point, because an audience will judge of the quality of service by small matters in the absence of more important ones. The stereopticon light is thrown on a clear white wall as this is superior to any form of screen which allows some light to pass through.

If the time of completion of lecture can be ascertained it is well to shut down the ventilating fans (or the motors which drive them) just before the lecture is completed as no furthur ventilation is required, and when the lamps are turned on their steady burning need not be disturbed by stopping these motors, for if this is done by pulling out a switch it is sure to cause lights to flicker. If the rheostat lever is thrown back carefully, one notch at a time, the speed of motors will be reduced gradually, thus avoiding any change that will be noticed by the audience. This suggestion applies to any occasion when the assembly room is illuminated.

Fig. 5 is a view of lamps located above the stage. They are fitted with opaque shades which throw light downward. These cannot be seen by the audience, as the illustration presents them as viewed from the extreme rear of stage looking towards the audience.

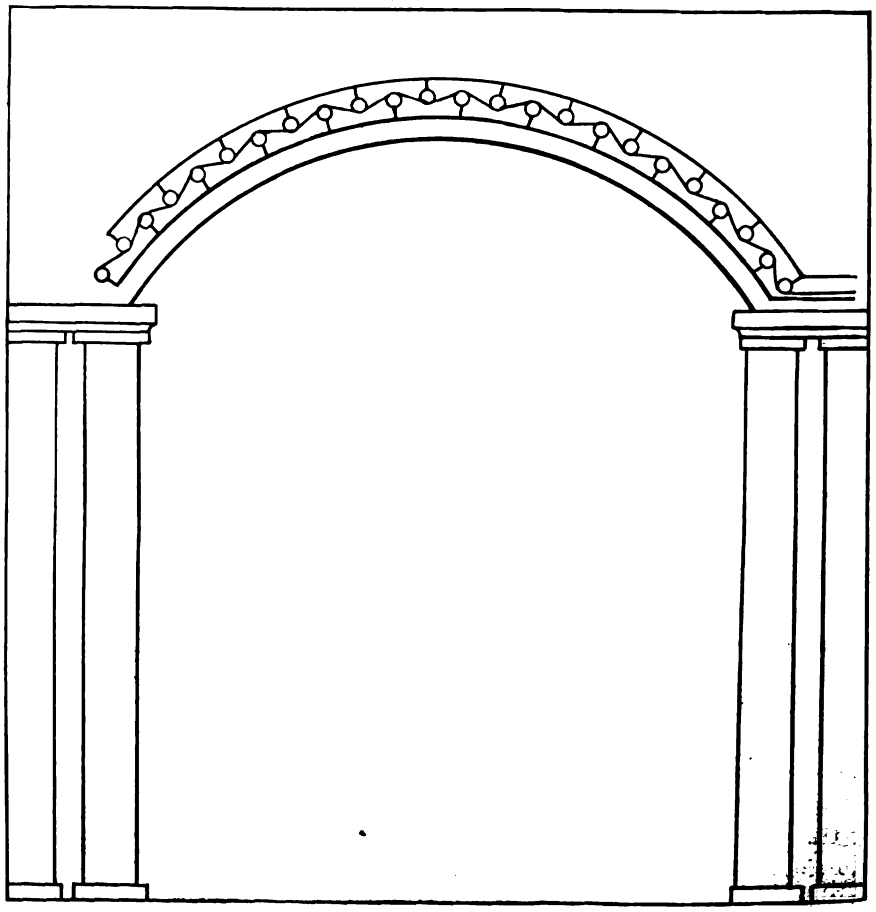

FIG. 5.

A unique plan was adopted for wiring these in order to light 12 of them first, giving an agreeable illumination which can be strengthened by turning on the 12 remaining. Three wires are used for this purpose, the upper and lower ones being positive while the middle is negative, and the operation is as follows:

When a switch controlling the upper and middle wires is thrown in current comes over the upper and feeds the 12 lamps connected to it, then returns over the middle. If this is not sufficient, another switch is thrown in, which sends current over the lower wire feeding the 12 lamps connected to it, then returning over the middle, which is thus caused to convey current enough for 24 lamps. If this was a large system it would be necessary to make the middle wire much larger than the others, but for a few lamps they are all of the same size, taking care to have them large enough.

A set of 24 footlights are arranged in the same way, thus throwing more or less light upon a speaker or an actor according to conditions.

Means are provided for darkening this rooom so that a stereopticon can be used, or other artificial effects secured, during the brightest day, thus making it possible to use it to the best advantage at all times.

The means used for darkening it does not interfere with its proper ventilation as it does in cases where a crude plan is adopted as, for instance, where heavy shades are used to darken windows that are the only source by which air can enter. It this case windows that admit light cannot be opened at any time, therefore when covered by heavy curtains air for ventilation enters through ducts in the usual way.

MAGNETIC BRAKES.

BY RALPH SCOTT.

Efficient electric railway service requires that the cars be quickly accelerated and rapidly retarded in order that stops may be made with a minimum loss of time. Fortunately an electric motor equipment possesses inherent means for accomplishing the latter purpose, which approach unto perfection. It is only of late years, however, that this principle has been applied advantageously and extensively, owing to the unexplainable reluctance of electric railway managers to accept what they had regarded as an impractical innovation.

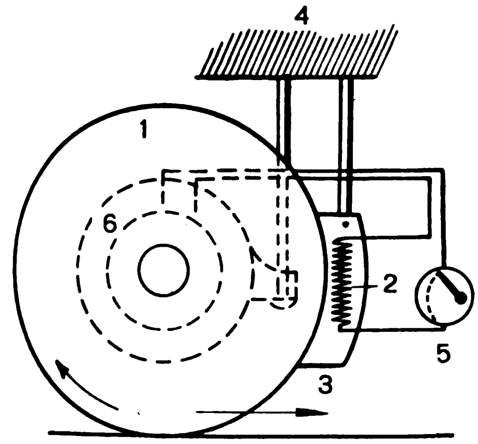

FIG. 1.

It is well known that a dynamo when discharging current into an external circuit must be supplied with an amount of mechanical energy theoretically equivalent to the watts expended in the entire circuit thus formed. This energy may be that of motion or translation. If, therefore, the energy represented by the inertia of a moving car can be expended in a circuit connected to the car motors (acting as generators) the car will be retarded by an amount proportional to the current given out by the motors.

Fig. 1 shows a diagram of an ideal brake embodying these principles. To the axle of the wheel 1 (moving in the direction of the arrows) is keyed the armature of the series motor 6. Connected in circuit with this motor is an electromagnetic brake-shoe, 2–3, and the adjustable resistance 5. The shoe 3 is securely suspended from the support 4, as is also a lug, preventing the field frame of the motor from turning. When the motion of the wheel is to be retarded the circuit is closed and all the resistance cut in. As the speed decreases the resistance is cut out so as to secure a practically uniform current, this being necessary owing to the constantly decreasing voltage. The braking effect is due to the three following causes:

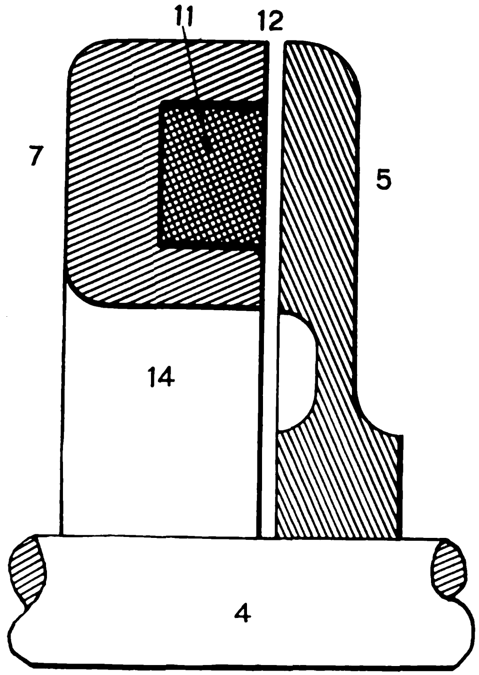

FIG. 2.

1. Friction of the brake shoe against the rim of the wheel.
2. Retardation of the motor, due to its acting as a dynamo.
3 Eddy current losses in both brake-shoe and rim of the wheel, due to the motion of the iron, which cuts the strong field.

These combined serve to produce a resultant that effectively stops the motion of the wheel. If gearing is used, a great strain is put upon the teeth of the gears unless the current is carefully controlled.

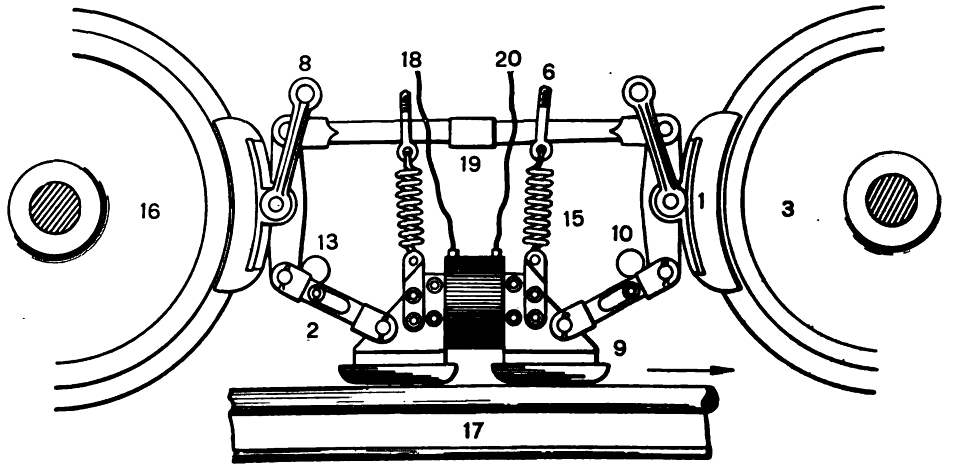

FIG. 3.

In Fig. 2, a brake which does not act upon the rim of the wheel is shown in section. To the axle 4 is keyed the cast-iron or the wrought spider 5. This moves close to a U-sectioned stationary ring 7, which incloses a coil 11. This coil is connected to the motors by a switch and in series with a variable resistance. When the switch is closed, the great flux passing through the magnetic circuit causes 5 to be strongly attracted, the air-gap 12 being reduced to zero. The braking effect is due to the eddy currents set up, the drag of the motors and the friction of the surfaces in rapidly moving contact.

In Fig. 3 is shown a form of brake that has been extensively applied. The terminals 18 and 20 of the coil are connected to the motors through a suitable switch and resistance, the shoes 9 being held a short distance above the rail 17 by the springs 15. Brake shoes 1, which are suspended near the rims of the wheel 16 and 3 by the links 8, are connected together and to the shoe part 9 by the links 19, 10, 13 and 2. The brake operates as follows:

If the car is moving in the direction of the arrow, the counter EMF. of the motors, when connected to the coil, sends a heavy current through the latter and thus produces a strong attraction for the rail. The friction and eddy currents tend to prevent its motion with the car, thus transmitting a pressure along 2 and causing 13 to force its shoe against 16; 13 being pivoted, part of the pressure is transmitted through 19 to the lever of the shoe. This lever, by being forced against the stop 10, presses 1 against the rim of 3.

The adhesion ratio of the truck is increased, due to the strong downward pull of the magnetic system. Skidding is thus prevented. A wet rail will not produce the pressure on the wheel shoes that a dry or sanded rail will, hence skidding is eliminated by the automatic variation of retardation that results.

By means of a diverter the current is kept within a safe limit. In moving down hill, the result of this constancy of current is to maintain a uniform speed of the car. If the current tends to increase (by increased voltage) the dragging effect increases, which in turn reduces the voltage and thus decreases the retardation. A change in resistance changes this critical speed, so that the motorman controls at will the speed of his car independent of the grade.

Fig. 4 shows a form of brake that finds application to stationary engine service. The rim of the flywheel 13 moves past the poles of the magnet 14, the curvature of these poles conforming to the crowning of the rim. The solenoid 9 is connected to a storage battery or to a dynamo driven by the engine. The magnet is prevented from moving with the rim by the loosely held links 11, secured to a stud solidly fastened. When the proper current is sent through 9 the flywheel may be stopped within one revolution whether the steam is on or not. As it is not usually necessary to make such rapid stops, a resistance is connected in series.

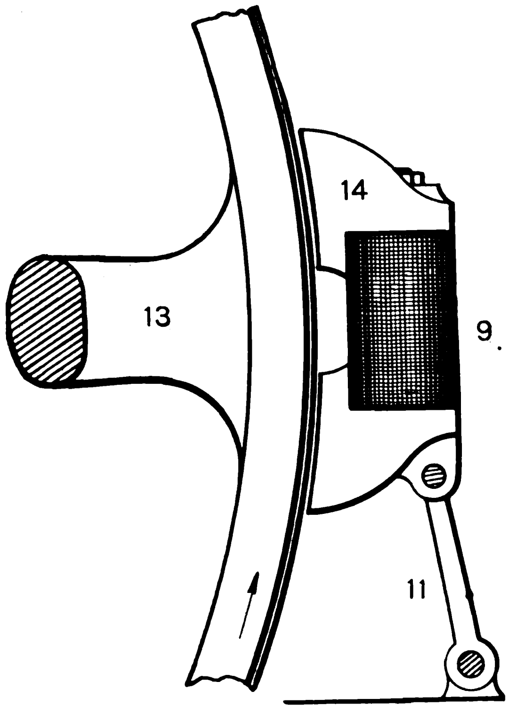

Fig. 4.

ELECTRICITY LEAFLETS.

BY NEWTON HARRISON, E. E.

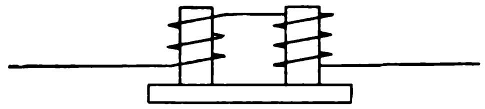
Telegraphy With Wires.

The Diplex System.—The practical principle employed in telegraphy for the purpose of obtaining different sets of signals over the same line is that of using certain keys to operate certain relays—one key, for instance, sending over the line a powerful current which actuates one relay, and another key controls the direction of the current and therefore can only operate another type of relay. The keys, therefore, are selective with respect to the relays. It is necessary to examine into the types of relays which can be thus effected. Such an examination will lead to a better comprehension of the meaning of a diplex system of telegraphy.

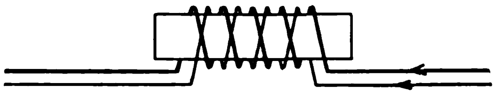
Kinds of Relays.—The relays may be classed according to the character of the current which will actuate them. They may be entitled as follows:

Neutral relay.
Differential relay.
Polarized relay.

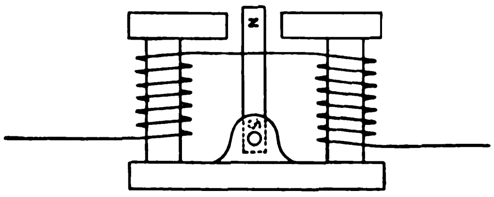
The neutral relay is, as its name implies, a relay operated by an ordinary current irrespective of its direction. Its only requisite must be sufficient strength to cause emphatic movement of its armature. It is simply an electromagnet, sensitive to a certain current whose strength is dependent upon its regulation.



NEUTRAL RELAY



DIFFERENTIAL RELAY



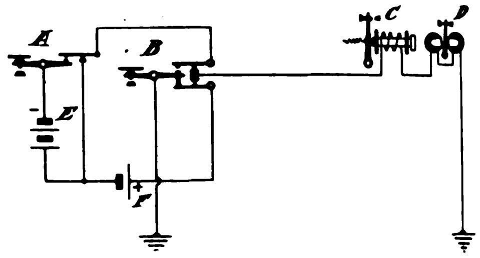
POLARIZED RELAY

Types of Relays used in Telegraphy.

The differential relay is an electromagnet possessing two distinct windings, each wound opposite to the other and each of exactly the same number of turns and resistance. The equivalence of the turns makes the magnetic effects alike, therefore the passage through the coils of two equal currents would leave the relay inoperative.

The Polarized Relay.—This relay, as its name denotes, is supplied with a permanently magnetized armature. The one pole of this armature lies between the two poles of an electromagnet. When this magnetized armature moves decidedly in one direction or the other it is because the current in the electromagnet is flowing in a certain direction. The armature is polarized for the purpose of making the relay sensitive to changes in the direction of current. Changes in the strength of current have no effect upon it.

In the illustration two keys are shown. The first, A, as indicated, will have the effect of sending into the line the current of three cells of battery. The key, it will be further observed, has no control over the direction of the current. When it is moved down it operates the first relay C, a neutral relay of the type previously described. The current passing through the second polarized relay is ineffective because it lacks the direction required to throw the armature on the particular side which closes the contacts governing the local circuit and its sounder.



The Diplex, the Basis of the Quadruplex.

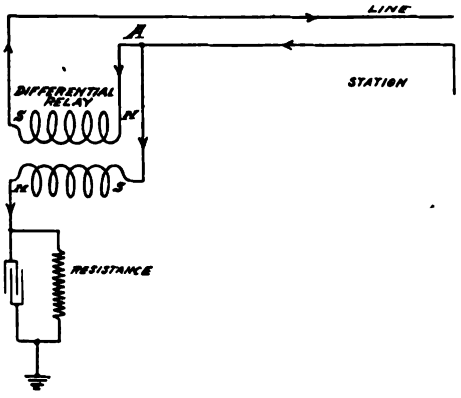
The second key, B, is a reversing key or pole-changing transmitter. Its only function is that of sending a relatively weak current into the line, which is either positive or negative, depending upon the position of the key. This weak current cannot affect the neutral relay which remains unresponsive to the currents passing through it unless sent by the first key A. The battery E and F will act in combination when key A is pressed, giving, therefore a much higher EMF. to the relay C than to D. When the key B is pressed to operate the relay D only one cell of battery F is in action. Relay C is evidently controlled by a rather powerful current sent into the line by the key A. Relay D is controlled by the second key B which, sending a weaker current into the line, still varies its polarity with reference to the line and therefore actuates the more delicately adjusted relay previously mentioned. Each relay, it must be remembered, is attached to a separate local circuit containing battery and sounder. Therefore, if one operator presses key A, a distant sounder in circuit with relay C gives its message. If another operator presses key B a distant sounder in circuit with relay D will deliver its message. This fact is to be distinctly remembered above all—that if both keys are worked simultaneously the direction of the current can be reversed at will by the operator at B. As this is the only influence which effects the polarized relay at D the system as thus presented is one in which two messages can be sent forward along the line at the same instant. This is the fundamental principle of the diplex system. Examination of key B will show that if the operator at A is holding his key and the operator at B reverses the current to actuate the relay at D the continuity of the line is not destroyed, but the relay C will relax for an instant, causing what is familiarly known as the *clip*. This is almost eradicated by the aid of special devices in practical telegraphy.

The Single Current Duplex.—In this system of telegraphy it is possible to send two messages over the line, each traveling in the opposite direction. It possesses certain essential and characteristic features which might be enumerated as follows:

First—A differentially wound relay.
Second—An artificial line.
Third—A transmitter.

The prevailing intention in this system, is to be able to send a message out of the station without affecting the relay installed there, yet permitting it to respond to the influence of a message or signal sent in. This seemingly difficult and paradoxical task, is accomplished by the proper co-operation and relationship of the three ideas presented above in conjunction with a storage battery.

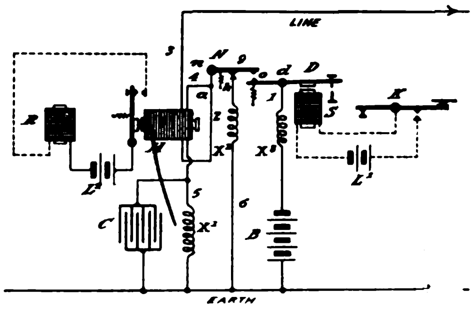
The Differential Relay being an electromagnet with two opposite and equal windings magnetically cannot be affected if each winding carries an equal current. If, therefore, when a signal is sent out of the station, the current it represents passes through this differential relay, then the problem resolves itself down to that of securing an equal flow of electricity through each of the windings of the relay. If means are employed, through which one-half of this current goes out over the line, and the other half is directed into the earth, then the difficulty has been removed and the object of keeping the relay inoperative under these circumstances secured.



Principle of Duplex, showing use af the Differential Relay and Artificial Line.

The Artificial Line now comes into play, in that it consists of a resistance equal to that of the line, and a condenser of a capacity also equal to that of the line. The current from the station is led to the point at which the two windings of the electromagnet begins, as shown in the sketch at A. If resistance R and the capacity C, are exactly equal to that of the line, then the current will divide equally at A. One-half will go through its winding and over the line. The other half will go through its winding into the earth. The currents being equal in each winding of the relay, it will remain unaffected when an outgoing signal is sent.

The Transmitter.—This device is employed in duplex telegraphy so that when the key is pressed, as shown in the sketch, the magnet S will pull the lever D, and raise the lever N at O. This enables the current from the battery B to pass into the differential relay, one-half to the line from n, and one-half to the earth from n. If at this moment, the distant telegrapher presses his key, then one of the coils of the differential relay will be supplied with more current than the other, and as a natural consequence of this, the relay will be operated. Its operation means the throwing in of the local circuit, and as a result the click of the sounder is heard. Examination of the diagram will show that the two ideas are faithfully carried out:



Single Current Duplex.

First—That of having the relay inoperative by an outgoing signal.

Second—That of having the relay operative by an incoming signal.

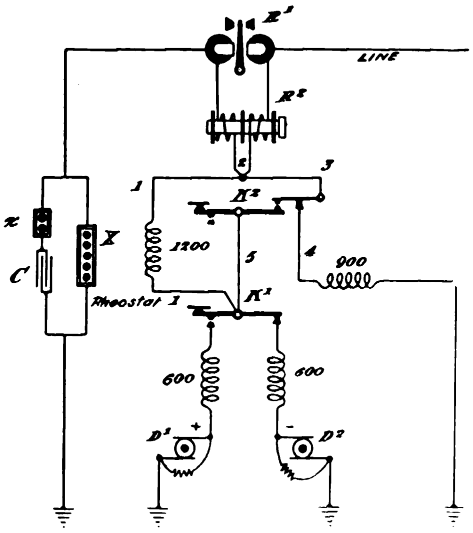
Examination of the Circuit.—Scanning the circuit closely will show the path of the different currents. When the key K is pressed, as already described, a negative current passes from the battery B through the levers D and N into the differential relay only to divide equally into the line and earth via the the two opposite windings of the relay. A signal sent in, however, means a current in only one winding of the relay, which of course will force it to operate, or it means a current superposed upon the other already passing through. This last condition only exists when both keys are pressed in each station at the same time. In the sketch, the wire grounded at 6, is there for the purpose of allowing an incoming current, whether positive or negative, depending only upon the arrangement of the batteries, after magnetizing the relay, to pass into the earth, otherwise two other paths are open through the resistance of the artificial line and the batteries B. The diplex and the duplex therefore differ from each other fundamentally in the respect that in the first case both the direction and the strength of the current are controlled to operate two relays adjusted to them; while in the second case, messages are transmitted in opposite directions, by having a relay in action sensitive only to the incoming impulse, remaining unaffected by the outgoing signals through the influence of the artificial line.

Purpose of the Condenser.—The introduction of the condenser in duplex telegraphy emanated from the brain of Joseph B. Stearns, who thus, by its practical application, removed from the apparatus the false signal its absence produces. The resistance of the artificial line and line proper may be the same; but it is obvious that if the line must be charged when signaling it is bound to discharge itself and affect the service. The line will act as a condenser with respect to earth, the line being one plate, the air the dielectric, the earth the other plate. Charging the line to get a signal through it would mean its subsequent discharge through the instruments. This now happens to an exaggerated degree in ocean cables. Duplexing a line, by adding an artificial line, consisting of resistance and capacity, is accomplished by the adjustment of these elements until the line is "balanced." Then the signaling is carried on from either end with the utmost facility. Adjustments of resistance and capacity must be carried on every day, particularly if the weather is changeable. Measurements will show that both the resistance and the capacity undergo continued and at times erratic variations.

The system of diplex, above described, is covered by the invention made in 1873 by Thomas A. Edison, patent No. 162,633. This system is in all respects the foundation of the present practical method of quadruplexing a line.

Quadruplexing a Line.—By this is meant the installation of apparatus, by means of which two messages can be sent from each end at the same time. Altogether, four different signals traverse the wire at one time without interference. The accomplishment of this, it is evident, would mean the use of two relays at each of the distant stations receiving signals. It it also obvious that when two signals are sent simultaneously from one station the relays of said station must not be actuated by the current. This idea is carried out in practice by the use of two differential relays at each station. These relays are respectively neutral and polarized, and operate in conjunction with an artificial line. In addition each station is provided with two keys of the characters previously described. One is used for sending a comparatively powerful current into the line, the other for reversing the polarity of the line. From this brief review it becomes apparent that this quadruplex is, in fact, a combination of duplex and diplex telegraphy.

In the illustration the quadruplex is shown operated by means of currents generated by dynamos D_1 and D_2. These take the place of batteries, and have proven themselves to be far more convenient. At D_1 and D_2 opposite poles are connected to the line when the two 600 ohm shunts are in curcuit. The description referring to this diagram, as given by Franklin Leonard Pope in his work entitled "Modern Practice of the Electric Telegraph" is as follows: "K_1 is the pole changing transmitter and K_2, the single current transmitter, which for simplicity are shown in the diagram as keys, but which are in practice operated by electro-magnets, local batteries and independent keys. When the apparatus is at rest, the current from the negative dynamo D_2 traverses a resistance coil of say 600 ohms, inserted to avoid danger of short circuit, to the rear contact of the pole changing key K_1; thence through wire 1, the 1,200 ohms to point 2, where it divides into three portions; the first portion going to the line and distant station, the second through the artificial line, including rheostat X to the earth, and the third through the wire 3, the normally closed rear contact of the single current key K_2 and a rheostat of say 900 ohms to the earth. If, for example, therefore, we assume the resistance of the main and artificial line to be 3,600 ohms each it follows from the law of the distribution of currents in branch circuits that two-thirds will return to earth through wires 3 and 4, one-sixth will go to the main line and one-sixth to the artificial line.



Quadruplex Operated by Dynamo Currents.

"If now the key K_2 be depressed in order to send a signal, a direct connection will be formed between key K_1 and the point 2 through wires 5 and 3, shunting the 1,200 ohm coil in wire 1. At the same time the wire 4 will be opened, and the whole current will divide at the point 2, half going to the main line and half to the artificial line. It follows, therefore, that with the several resistances in the ratios shown, the current sent to line by the key K_1 when key K_2 is depressed will be three times as strong as when the latter is raised, and this will be equally true whether the current sent by key K_1 be positive or negative. A computation of the effects of the several resistances will also show that when an arriving current reaches the point 2, the resistance which it has to encounter in passing thence to the ground is the same whether the key K_2 be depressed or raised. When the key is depressed the resistance is only that of one or the other of the 600 ohm coils between the key K_1 and the dynamos; when raised, it is the joint resistance of one coil of 600, plus the coil of 1,200 (a total of 1,800) in one branch and the coil of 900 in the other branch, the joint resistance of the two being 600, the same as in the first instance. The relays R_1 and R_2 at each station being both differential are not affected by outgoing currents, whatever may be the strength or the polarity of such currents."

NOTES ON THE CARE AND MANAGEMENT OF DYNAMOS.*

BY W. J. H.

A most important element in the efficiency of dynamos and motors, and one which makes considerable difference to their lifetime, is the care with which they are treated, and the immediate remedy of any fault or irregularity that may appear in them. It requires a certain amount of experience to be able to detect these faults and irregularities as soon as they occur, and also to know the proper steps to be taken to correct them before the damage becomes at all serious or has time to deteriorate the machine.

In many cases a breakdown or failure in a dynamo may be traced to negligence or carelessness pure and simple. Dynamo machinery cannot withstand ill-usage and overloading, although motors generally increase their output in proportion to the demand made upon them until a certain limit. If intelligence and common sense are used, a capable engineer should have no difficulty in looking after an electrical plant, and in keeping it up to its standard of efficiency by a system of regular running, cleanliness and general care. Of course, the treatment of dynamos in general applies to motors also. A most important point to be noticed is the temperature to which a dynamo attains after a few hours' run; good modern machines rarely increase in temperature more than 40 degs. to 45 degs. Fahr. above the surrounding temperature of the room in which they are running, after a run of many hours on full load. The parts that are seriously affected by a temperature rise are, of course, the armature and field coils, and any temperature under 130 degs. Fahr. is quite harmless to the insulation of these.

Care should be taken that the dynamo is quite rigid on its foundation, and no vibration whatever should be permitted to take place when the dynamo is running. This point should always be kept in mind by the attendant, who should make it his place to tighten up all loose bolts and bearings as soon as any tendency to looseness is apparent. In setting the brushes on the commutator, the points should always be placed diametrically opposite each other, resting very lightly on the commutator. They will probably need moving forward occasionally to maintain this position, and if it is noticed that the points become ragged or rough and uneven, they should be trimmed with a file or scissors.

It is most important that continuous-current machines should be free from sparking at full load. There should be a system of continuous lubrication, and all bearings should run cool. The most satisfactory lubricant to be used for the commutator is vaseline, which should be used sparingly, and wiped carefully off with a non-fibrous rag, in order to leave the least possible amount of lubricant to insure satisfactory results. If the brushes are made of alloy sheets, lubricating the commutator is not often necessary, as they give excellent results without. It sometimes happens that from inattention or structural faults, that the surface of the commutator becomes grooved and uneven; the armature should be taken out and turned up lightly in a lathe. With moderate attention the commutator should soon assume a fine dark polish.

When grit or dust gets into the bearings, they should be cleaned by means of thin oil poured into them, which will wash out the dirt. The importance of a perfectly true "run" cannot be overestimated, and a crooked belt which slides from one side of the pulley to the other is sure to give trouble sooner or later. The joint in a belt should be as smooth and as near the size and shape of the rest of the belt as possible, as the damage done to a dynamo with a belt which "knocks" as it passes over the pulley is incalculable.

---

*From the "Electrical Engineer," London.

In order to run in a satisfactory condition the dynamo should make as little noise as possible. One of the first signs of looseness of bolts or vibration is a loud noise, which means that the dynamo is wearing in some part and needs tightening down, or else it is attributable to loose bearings, or armature or pulley out of balance.

It is frequently the habit of an inexperienced attendant to replace a blown fuse with one of greater capacity, thus inducing overload to the dynamo. Automatic cut-outs are used largely recently, which prevent this occurrence. A dynamo may refuse to start if the contacts be loose or bad, or if a circuit be broken and the residual magnetism be diminished. When a motor fails to start or stops, the cause may be a break in the circuit, bad contact or loss of magnetism or overload.

When handling a dynamo when working the attendant should always see that his hands are dry, and if anything goes wrong he should preserve his equanimity, and keep cool, as presence of mind can often avert catastrophe.

Civil Engineers to Improve Home.

Plans have been filed with the New York Building Department for the enlargement of the Society House of the American Society of Civil Engineers, the organization that declined to affiliate with other societies in accepting Mr. Andrew Carnegie's recent gift of a $1,350,000 club house and technical building. The house is a four-story edifice at 222 West 57th street, and it is proposed to add a four-story annex which will give the building a total frontage of 75 feet. The second story will contain the library and a large auditorium. The improvements will cost $60,000.

Judge Townsend in New York on Saturday granted the motion of counsel for the American De Forest Wireless Telegraph Company, suspending the injunction the court had recently granted in favor of the Marconi Wireless Telegraph Company pending final hearing of the case.

NATIONAL ELECTRIC LIGHT CONVENTION.

OFFICIAL PROGRAMME AND TRANSPORTATION INFORMATION.

The 28th Convention of the National Electric Light Association will be held at Brown Palace Hotel, Denver, Col., June 6, 7 and 8, and at Colorado Springs June 9, 10 and 11.

The official programme, information about transportation and other notes of interest will be found in the following:

HEADQUARTERS.

The headquarters of the association will be at Brown Palace Hotel. This hotel will not accommodate all the delegates but there are a number of other first-class hotels in the immediate vicinity, where the hotel committee will place those making application too late for the rooms at the Brown. Reservations should be made through Mr. Frank Farrar, committee's secretary, 405 17th street, Denver. Full information regarding hotel arrangements has already been sent out by the committee.

ENTERTAINMENT.

The entertainment of delegates will include a theater party at the Elitch Summer Gardens, a luncheon at the Denver Country Club for the ladies, followed by a drive about the city. The ladies will also be entertained at the Orpheum Theater during an evening session of the convention, and after this session the men will be entertained at a smoker.

One afternoon will be devoted to a Broncho Busting contest. Great care has been taken in selecting for this typical Western exhibition the best horses and men to be found in Wyoming, Colorado and Mexico.

On Friday morning the entire party will be taken to Colorado Springs on special trains. During Friday afternoon there will be drives to points of interest about Colorado Springs, Glen Eyrie, Garden of the Gods, Cheyenne Canons, over the Bear Creek Canon road to Bruin's Inn; also visits to the power plants of the Colorado Springs Interurban Railway Company, the Colorado Springs Electric Company, the Curtis Company's lignite coal mines, the reduction mills at Colorado City, the Pike's Peak Hydro-Electric Company's hydraulic plant at Manitou, from which point the delegates may take the "Cog Road" to Pike's Peak. In the evening there will be a concert at the Broadmoor Casino.

Saturday will be given to an all-day trip to Cripple Creek, through the most beautiful scenery in Colorado.

On Sunday such of the delegates as desire to do so will have an opportunity to take trips mentioned for Friday afternoon, as it will be impossible for all these trips to be taken in one day.

TRANSPORTATION.

Unusually low rates have been authorized by the respective railways to Denver-Colorado Springs meeting. From all points in the Western Passenger Association territory a rate of one fare plus 50 cents for the round trip has been granted, this to apply only where one-way rate is $12 or more.

The Trans-Continental Passenger Association has authorized a rate from California to Denver and return of one fare. The New England Passenger Association and Trunk Line Association have authorized a rate of a fare and one-third from the respective points in their territory to Chicago and St. Louis plus the rates authorized by Western Passenger Association, namely, $30, Chicago to Denver and return.

Other associations will probably make similar concessions, but no official notice has yet been received. Ask your ticket agent when buying your ticket, regarding special rates for this convention.

Arrangements have been completed for a special train of Pullman sleeping, dining, parlor, smoker and observation cars, via Pennsylvania and Burlington Railways, leaving New York at 10:25 A.M. Saturday, June 3, and running as the second section of the Limited, for the convention. The train will arrive at Chicago at 8:25 A. M. June 4, leave at 11:15 the same morning, and arrive at Denver at 2:30 P.M. June 5.

At Chicago the train will be consolidated with cars for the special party that is being made up at that point.

The fare from New York to Denver and return on this train will be $56.70. Sleeping car berth, New York to Denver, $11.

Applications for space on this train should be made to Mr. C. H. Hodskinson, 70 State street, Boston; Mr. Frank L. Perry, Marquette Building, Chicago, or to Mr. George F. Porter, 136 Liberty street, New York.

HOW TO PURCHASE TICKETS.

If you desire to travel via Burlington, Rock Island, or Union Pacific, buy tickets through Denver to Colorado Springs with stop-over privilege at Denver on the going trip.

If you desire to travel via the Santa Fe, Missouri Pacific, Denver & Rio Grande, Colorado Southern and Colorado Burlington, buy tickets through Colorado Springs to Denver with stop-over privilege at Colorado Springs on the return trip.

PROGRAMME.

TUESDAY, JUNE 6—FIRST SESSION, 10 A.M.

Convention Hall, Brown Palace Hotel.

Address of Welcome, the Mayor of Denver.

President's Address, Ernest H. Davis, Williamsport, Pa.

Report, Progress, T. Commerford Martin, New York.

The Paramount Importance of Choosing Standard in Preference to Special Machinery, David Hall, Cincinnati, O.

Insulation Testing—Apparatus and Methods, C. E. Skinner, Pittsburg, Pa.

TUESDAY, JUNE 6—SECOND SESSION, 2 P.M.

Automatic Synchronizing of Generators and Rotaries for Lighting and Power Systems, Paul MacGahan, Pittsburg, Pa.

Notes on Rotary Converters and Motor Generators for Lighting and Power Systems, Louis E. Bogen, Cincinnati, O.

The Organization of Working Forces in Large Power Houses, W. P. Hancock, Boston, Mass.

Report of Committee on Steam Turbines, W. C. L. Eglin, Chairman, Philadelphia, Pa.

Operating Features of the Curtis Steam Turbine, A. H. Kruesi, Schenectady, N. Y.

WEDNESDAY, JUNE 7—THIRD SESSION, 10 A.M.

Series Alternating Current Motors for Industrial Work, Clarence Renshaw, Pittsburg.

A New Type of Single-Phase Motors for Elevator Work, S. Percy Cole, St. Louis, Mo.

Long Distance High-Tension Transmission in California, John A. Britton, San Francisco.

Report, Present Methods of Protection from Lightning and other Static Disturbances, Alex Dow, Detroit, Mich.

The Nernst Lamp—Its Present Performance and Commercial Status, E. R. Roberts, Pittsburg.

The Choice of an Insulated Cable, Wallace S. Clark, Schenectady, N. Y.

WEDNESDAY, JUNE 7—FOURTH SESSION, 8 P.M.

Some Investigations of Induction Losses, E. P. Dillon, Colorado Springs, Col.

Mercury Arc Rectifiers, P. D. Wagoner, Schenectady, N. Y.

Report, Advertising Methods, Percy Ingalls, Newark, N. J.

Report, Sign and Decorative Lighting, Le Rue Vredenburgh, Boston, Mass.

Free Signs and Flat Rates, C. W. Lee, Newark, N. J.

THURSDAY, JUNE 8—FIFTH SESSION, 10 A.M.

Report, Progress of Electric Heating, James I. Ayer, Boston, Mass.

Report, Purchased Electric Power in Factories, E. W. Lloyd, Chicago.

Report, Committee on District Steam Heating, W. H. Blood, Jr., Chairman, Seattle, Wash.

Wrinkles, H. C. Abell, Editor, New York City.

THURSDAY, JUNE 8—SIXTH SESSION, 2 P.M.

Report, Committee on Relations with Kindred Organizations, James I. Ayer, Chairman, Boston.

Executive Session.

Report, Committee on Rates and Costs, Charles L. Edgar, Chairman, Boston.

Report, Municipal Ownership, Arthur Williams, New York City.

Question Box, Homer E. Niesz, Editor, Chicago.

THURSDAY, JUNE 8—SEVENTH SESSION 8 P.M.

Executive Session.

Report of Secretary and Treasurer.

Report of Executive Committee.

Report of Committee on Relations between Manufacturers and Central Station Companies, Henry L. Doherty, Chairman, Denver, Col.

Report of Committee on Standard Rules for Electrical Construction and Operation, Charles L. Edgar, Chairman.

Election of Officers.

Strange Telephone Situation in Indiana.

The Central Union Telephone Company, a licensee of the American Telephone & Telegraph Company, has entered into a working agreement with the United Telephone Company, an Independent Company, with the result that the latter company becomes a sub-lessee of the American Telephone & Telegraph Company.

President L. G. Richardson, of the Central Union Telephone Company, who is now in the East, says:

"The arrangement entered into between the Central Union and United Telephone Companies is one of the most important which has taken place in telephone circles in many years. The Central Union will lease the Bell instruments to the United Company, and as our company has no connections in the field occupied by the United Company, this arrangement practically gives us a new telephone field.

"The United Telephone Company has $480,000 bonds and $300,000 stock outstanding and its property is worth about $700,000. This company owns the exchanges and toll lines in Wells, Grant, Blackford and Huntington Counties in Indiana and has 5,000 subscribers.

"Under the new working agreement the United Company secures connection with the toll lines of the Central Union Telephone Company and those of the American Telephone & Telegraph Company. The United Company heretofore has been operated in connection with the Independent telephone companies in Indiana, but will now sever its affiliation with the Independents, and will be operated in connection with the Bell companies.

"The president of the United Company is Hugh Dougherty, president of the Marion Trust Company, Indianapolis."

ANNUAL MEETING OF THE AMERICAN INSTITUTE OF ELECTRICAL ENGINEERS.

A large attendance was present last week at the annual meeting of the American Institute of Electrical Engineers, held in the chapter room of Carnegie Hall, this city.

The proxy tellers announced the result of the balloting for officers as follows: President, Dr. S. S. Wheeler; vice-presidents, C. A. Terry, T. Wolcott, Gano S. Dunn; managers, C. C. Chesney, Calvert Townley, Bancroft Gherardi, C. L. Edgar; treasurer, G. A. Hamilton; secretary, R. W. Pope. Dr. Wheeler received 1,031 votes, his election being almost entirely unanimous.

The reports of officers and committees were presented and accepted. The secretary reported that the membership on May 1 was 3,460.

The financial statement for April, 1905, shows that the cash on hand was $39,301.15, the value of the Institute properties was $44,220.11, making a total of $92,396.89.

Mr. Calvin W. Rice, chairman of the land and building fund committee, reported that this fund has reached the sum of $66,000, two of the recent contributions being $5,000 from Thomas A. Edison and $5,000 from Dr. M. I. Pupin, the latter being given under the condition that nine other members of the Institute give a similar amount.

The report of the board of examiners was read by the secretary. This suggests that the board of trustees consider establishing a new class of membership, to which associates who have become eminent in their particular field, but who are not practicing engineers, shall be eligible.

The Institute's Annual Convention.

The annual convention of the American Institute of Electrical Engineers will be held at Asheville, N. C., June 19 to 23. A long list of papers has been prepared for presentation to the convention. The committee on transportation and arrangements is Frederick C. Bates, chairman, 44 Broad street, New York City; Samuel Sheldon and Arthur Williams.

New York State Independent Telephone Convention.

The annual convention of the New York State Independent Telephone Association will be held at the Common Council Chamber, City Hall, Albany, June 16. A good programme has been prepared and from the present indications the attendance will be large. Some effiective work has been done throughout the State during the past year by the organization of district associations, which form a part of the State Association.

Further information relative to the convention can be secured by addressing the secretary, T. S. Lane, 332 Ellicott street, Buffalo, N. Y.

The Canadian Electrical Association Convention.

As already announced in ELECTRICITY the annual convention of the Canadian Electrical Association will be held in Montreal June 21, 22 and 23. Secretary Mortimer announces the following as some of the papers to be read:

"Transformers," by Mr. R. T. MacKeen, Toronto; "Operation of Transformers at Varying Frequencies and Voltages," by Mr. Sammett, Montreal; "Induction Motors," by Mr. Burson, Montreal; "Economy of Isolated Plants," by Mr. T. L. Aitken, Toronto; "Carrying Capacity of Inclosed Conductors," by Prof. R. B. Owens, McGill University.

Naval Stations Catch Wireless Messages.

The Bureau of Equipment at Washington continues to receive interesting reports from the operations of wireless telegraphy as conducted by the Navy afloat and ashore.

The Washington Navy Yard reports that the wireless station there caught a message passing between the Boston Navy Yard and the station on Thatcher's Island, off the New England coast.

The bureau also has been informed that a wireless news bulletin, which was being sent from Cape Cod seaward, was caught on the Cruiser Maryland, lying at dock at Newport News. In each instance the distance was several hundred miles.

Important Traction Deals.

A Portland, Ore., dispatch says the Portland Consolidated Street Railway Company, operating nearly all the street car lines in Portland, has been sold to a syndicate of Pennsylvania capitalists for $5,000,000.

A dispatch from Columbus, O., May 22, says the Ohio Traction Company of Cincinnati was incorporated under the laws of Ohio with a capital stock of $20,000,000, in accordance with a plan of the Widener-Elkins syndicate, recently announced. The incorporators are W. Kesley Schoepf, W. S. Rowe, W. C. Proctor, Briggs S. Cunningham and W. T. Irwin.

A New Insulator.

In a recent issue of the "Elektrotechnische Zeitschrift" there appears a description of a new insulating material known as Galalith. It is prepared from skim milk, by a process on the whole similar to that employed in the production of ebonite. The result is a material having a structure which also resembles that of ebonite or horn. Water is first removed from the skim milk, the resulting product being hardened and then treated with certain acids, the material thus obtained being plastic. It is next pressed by hydraulic power into definite shapes and it is finally treated in a drying stove. Galalith is said to be from about 28 to 30 per cent. more elastic than ebonite and is easily machined. Its density is about 1.4.

Proposals Invited.

Washington, D C.—The Bureau of Supplies and Accounts of the Navy Department is inviting sealed proposals until June 6 for furnishing Eastern navy yards with the following electrical material: Schedule 257, incandescent lamps, carbons, dry batteries, switches, wires, electrical supplies; schedule 258, starting panel; schedule 260, motors; schedule 262, motors; schedule 263, insulating tape. Proposal blanks and other information can be obtained upon application to the Navy Pay Office in New York.

ELECTRICAL PATENT RECORD.

LETTERS PATENT ISSUED MAY 16, 1905.

Electric Railways and Appliances.

789,702. Electric Signal System. Edwin J. Adams, Waco, Tex. Filed Feb. 13, 1904.

789,715. Pneumatic Trolley-Check. Andrew G. Cassidy, Waltham, Mass. Filed Nov. 5, 1904.

789,804. Trolley Catcher and Retriever. Walter W Geiser, Altoona, Pa. Filed Dec. 19, 1903.

790,024. Fender. Summers F. Beckwith, Charleston, W. Va. Filed Sept. 20, 1904.

790,107. Trolley. John H. Clark, Urichsville, O. Filed March 3, 1905.

Electric Lights and Appliances.

790,152. Incandescent-Lamp Socket. Guy H. Proctor, Somerville, Mass., assignor, by mesne assignments, to the Bryant Electric Company, Bridgeport, Conn. Filed May 10, 1904.

Electrical Machinery and Apparatus

789,727. Transmission-Gearing. Norman T. Harrington, Detroit, Mich., assignor to the Olds Motor Works, same place. Filed March 21, 1904.

789,754. Governor for Non-Automatic Electric-Motor Controllers. William J. Napier, Leichhardt, New South Wales, Australia. Filed Jan. 6, 1904.

789,914. Electric Switch. Frederick Huffer, New York City. Filed Oct. 31, 1904.

789,917. Machine for Grinding Commutators of Dynamos or Motors. William H. Jordan, Brooklyn, N.Y., assignor of three-fourths to John F. Jordan, George A. Jordan and Christopher C. Jordan, same place. Filed Aug. 20, 1904.

789,975. Electric Switch. Gustave L. Herz, New York City. Filed Oct. 7, 1904.

790,100. Safety Device for Motor-Starters. Frederick G. Bill, Long Island City, N. Y., assignor of one-half to Francis H. Murphy, New York City. Filed Feb. 21, 1905.

790,155. Electric Time-Switch. Jerome Redding, Boston, Mass., assignor to the Redding Automatic Time Switch Company, same place. Filed May 21, 1904.

790,258. Alternating-Current Meter. Albin May, Berlin, Germany, assignor to the Internationale-Elektrizitäts-Zahler, Gesellschaft, M. B. H., same place. Filed July 29, 1903.

790,262. Indicating-Dial for Electric Switches. Charles G. Perkins and Nathan W. Crandall, Hartford, Conn., assignors, by mesne assignments, to the Perkins Corporation, same place.. Filed Oct. 19, 1904.

Telephones and Telephone Apparatus.

789,716. Telephone-Transmitter. Henry P. Clausen, Chicago, Ill., assignor to the American Electric Telephone Company. Filed Aug. 20, 1902. Renewed April 6, 1905.

789,748. Code-Signaling Telephone. Charles T. Mason, Sumter, S. C., assignor to the Sumter Telephone Manufacturing Company. Filed Feb. 11, 1905.

789,925. Coin-Controlled Telephone System. Charles W. Mahon, Chicago, Ill. Filed Sept. 6, 1904.

789,985. Telephone Cut-off. Herbert Manring, Weatherby, Mo. Filed July 14 1902. Renewed Feb. 14, 1905.

790,103. Combined Annunciator and Jack for Telephones. Daniel W. Campbell, La Crosse, Wis., assignor to the Vought-Berger Company, same place. Filed July 25, 1903.

790,241. Antiseptic Mouthpiece for Telephones or the Like. Walter Wright, San Francisco, Cal. Filed May 12, 1904. Renewed April 21, 1905.

Miscellaneous.

789,721. Electrolytic Apparatus. Frank A. Decker, Philadelphia, Pa., assignor to the Decker Manufacturing Company, Wilmington, Del. Filed Feb. 29, 1904.

789,740. Electrolytic Apparatus. Woolsey M. Johnson, Iola, Kan. Filed Aug. 14, 1903.

789,769. Relay. Jesse Summers, Indianapolis, Ind., assignor to the Indianapolis Watchman Clock Company. Filed July 5, 1904.

789,778. Signaling System. Joseph A. Wilson, Westfield, N. J., assignor to the Hall Signal Company. Filed Sept. 13, 1904.

789,814. Interrupter. Maurice K. McGrath, Antwerp, Belgium, assignor to the Western Electric Company, Chicago, Ill. Filed Oct. 21, 1904.

789,822. Automatic Electric-Current Regulator. Thomas A. Swarts, Columbus, Ohio. Filed Feb. 29, 1904.

789,877. Relief-Valve for Storage Batteries. David P. Perry, Chicago, Ill., assignor to the Vesta Storage Battery Company. Filed May 22, 1903.

789,886. Lightning Arrester. Guy H. Short, Stillwell, Ill. Filed Aug. 1, 1904.

790,095. Electric Signaling System. Samuel M. Young and Fitzhugh Townsend, New York City. Filed Oct. 18, 1904.

790,179. Wireless Telegraphy. Ferdinand Braun, Strassburg Germany. Filed Nov. 4, 1904.

790,189. Electric Alarm System. Hippolyte M. Cooper, Coopers Plains, N. Y. Filed Oct. 15, 1904.

790,193. Telegraphy. Patrick B. Delaney, South Orange, N. J. Filed June 30, 1902.

790,226. Electrical Furnace. Isedore S. Prenner, Scranton, Pa., assignor of one-half to Gus. N. Brown, Scranton, Pa. Filed March 21, 1903.

THE TELEPHONE WORLD.

Independent Telephone Men Meet in Texas.

At the recent meeting of the Independent Telephone Association in Dallas. the principal business was the reports of different committees that had been appointed, the discussion of their reports and matters of interest in regard to the welfare of the Independent companies in the State were discussed. A large number of representatives of supply houses were on hand and were admitted to the meeting as delegates.

The applicants desire to construct a line between Dallas and Fort Worth, which they claim will give all Independent lines and exchanges connection at Dallas.

It is believed that the purpose of the meeting in Dallas at this time is to encourage the council in granting the application of the Texas Long Distance Telephone Company for a franchise into Dallas. After much discussion of the matter of securing a franchise at this meeting, a committee composed of F. B. McElroy and A A. Miller, of Dallas, and James Murray, of Fort Worth, was appointed to take the matter up.

Frontier Company Elects Officers.

At a recent meeting of directors of the Frontier Telephone Company held in Buffalo, N. Y. B. G. Hubbell, president of the Consolidated Telephone Company, was elected president and director of the Frontier Company, and H. H. Persons, former president, was elected first vice-president.

This change was agreed upon at the time of the Consolidated Telephone Company's purchase of the control of the Frontier Company, and follows the plan of the company in having its president elected president of all the subsidiary companies. Mr. Hubbell is a practical telephone man, who has made great success in his operations of the many telephone properties owned by the Consolidated Telephone Company, and great things are predicted for him in his management of the Frontier Company.

Other directors elected were R. R. Hefford, F. C. M. Lautz and Robert W. Chapin, who filled vacancies caused by resignations of out-of-town directors.

Judge Robert E. Umbel, John M. Core and Robert F. Hopwood, the executive committee of the Tri-State Telephone Company, have effected a deal in Uniontown, Pa., whereby the Tri-State Company became the owner of the Monongahela Valley Telephone Company, which is composed mostly of Brownsville capitalists.

The Miller, S. D., city council has granted Waite & Halbower a franchise to build a telephone line into that city. The purpose is to build a line to the country districts.

Claude Eaton, who in partnership with Fred Scoresdy, has bought the Sterling, Kan., telephone exchange, and says they are preparing to put in a greatly improved service in that city.

It is announced that $25,000 improvements to the Co-operative telephone line of Detroit, Mich., will be completed in from four to six weeks.

Independent Telephone Merger in Nebraska.

The Independent telephone companies in Northeast Kansas, Northwest Missouri, Southwest Iowa and Southeast Nebraska, have consolidated into one company. The new company will control all the Independent telephone lines between Kansas City, Omaha, Lincoln, Red Oak and all intermediate cities and towns. Bonds to the amount of over $500,000 will be issued. The promoters of the consolidation acknowledge that a merger has been agreed upon, but refuse to give out any of the particulars.

Telephone Merger Planned.

The consolidation of all the important telephone lines of the Peninsula and their merger into the Diamond State Telephone Company of Dover, Del., is being planned. The companies included are the Maryland and Delaware Telegraph & Telephone Company, of Wicomico County; Eastern Shore Telegraph & Telephone Company of Caroline County; Onancock Telephone Company, Peninsula Telephone Company, and the Atlantic Telephone Company, of Virginia. The Onancock, Atlantic and Peninsula Companies, all Virginia concerns, will shortly have meetings of their stockholders, when a decision will be reached by them in regard to their action in this matter. The Eastern Shore and the Maryland and Delaware Companies will have meetings early in June for the same purpose.

C. C. Curtis, manager of the Independent telephone exchange at Sandusky, O , will become manager of the Southern Ohio district for the United States Telephone Company May 27. The field has been included in other districts, but recently a division was made, and Mr. Curtis will have charge of nearly all territory south of Youngstown and Lima, with the exception of Dayton and Columbus, and the counties surrounding these cities.

The Pleasantdale Telephone Company is the second Independent concern to incorporate in Pleasantdale, Neb., recently. The capital stock is given at $10,000, and the incorporators are W. Cody, C. H. Oxley, E. Courtright, F. C. Finke, H. C. Finke, L. Finke and C. Mason.

The toll rate on the long-distance line of the Delaware & Atlantic Telegraph & Telephone Company from Wilmington, Del., to Baltimore, Md., has been reduced from 50 to 35 cents for a three-minute talk, the night rate being 25 cents.

The directors of the Smith County Telephone Company recently met in Taylorsville, Miss., and arranged to put in an exchange there and at Raleigh. The line is in operation from Taylorsville to Raleigh via Hissop and Bezer.

The Home Telephone Company, which secured a franchise from Meridian, Miss., several months ago, has begun work with a large force of men putting its wires underground.

The Cambridge, Me., Telephone Company will extend its line to Parkman and Webber, this summer.

Telephone Manufacturing Company to Dissolve.

Proceedings for the dissolution of the Maryland Telephone Manufacturing Company, of Baltimore, were instituted by the company in Circuit Court No. 2 about 10 days ago through Marbury & Gosnell, attorneys.

The company was incorporated March 2, 1898, with an authorized capital stock of $25,000. Up to February 7, 1904, it was engaged in the manufacture of telephone equipment, but the great fire destroyed its plant, property and everything connected with the business.

In order to start business again an entirely new plant would have to be purchased, but because of the great competition at this time, it was deemed beneficial for the interests of the stockholders and others to dissolve the company. The dissolution was determined upon at a meeting of the directors March 27 and at a general meeting of the stockholders May 1.

The company has cash assets of $25,079.58 and no debts.

An order signed by Judge Dennis requires cause to be shown by June 12 why the company should not be dissolved, if any such cause exists

Berlin's Telephone System.

According to a recent report, Berlin possesses a network of telephones which now numbers 86,000 apparatus actually in use. The telephone department divides the system of connections into several sections. No. 1 alone has 13,538 subscribers, while No. 4 comes in a good second with 12,884.

The annual meeting of the Schenectady, N. Y., Home Telephone Company was held recently and the directors were re-elected as formerly with the exception of J. F. Deems and E. E. Williams, who are succeeded by Homer Strong and J. W. Smitley. The officers elected for the ensuing year by the directors are Charles F. Veeder, president; Irving H. Griswold, vice-president; Sam M. Strong, secretary; Evans S. Kellogg, treasurer. A large amount of new cable work was authorized and will be installed at once to accommodate the growing list of subscriptions.

The annual meeting of the stockholders of the Red Jacket Telephone Company, of Manchester, N. Y., was held lately, and the following officers were elected: President, Carlos P. Osgood; vice-president, Robert B. Peck; secretary, Willis C, Ellis; treasurer, Oliver S. Titus.

The Stark County Telephone Company, of Toulon, Ill., has increased its capital stock from $6,000 to $20,000.

Telephone Incorporations.

The Home Telephone Company, Oneonta, N. Y. Capital stock, $50,000. Directors: W. B. Brown, A. W. Cutler and M. G. Keenan, all of Oneonta.

The Champlain Valley Telephone Company, Portland, Me. Capital stock, $150,000. Officers: President, F. W. Story, Boston; treasurer, C. H. Adams, Portland; clerk, Frederick Hale, Portland.

The Ne-ah-ga Telephone Company, Sterling, N. Y. Capital stock, $1,500. Directors: J. R. Ingersoll, W. R. Andrews. L. S. Frolick, all of Sterling.

GENERAL ELECTRICAL NEWS.

LIGHTING.

Albany, N. Y.—The Empire Transmission Company has been organized to deal in electricity for light, heat and power. Its capital stock is $25,000, and incorporators, John P. Brooks, William J. Hough, Albany, and Joseph A. Lawson.

Alden, Ia.—On May 29 the people of this place will vote on the question of granting the Peterson Heat, Light & Water Company, of Des Moines, an electric light franchise. There is no opposition to the proposition, and it is generally conceded it will be carried almost unanimously.

Blasdell, N. Y.—The Blasdell Electric Company has been formed to supply electricity for light, heat and power. Its capital stock is $50,000, and directors, J. B. Wall, M. M. Wall and T. H. Wall, all of Buffalo.

Bloomsburg, Pa.—The Berwick Electric Light Company will soon improve its plant on Pine street.

Bristol, Vt.—The electric light plant here is to be thoroughly overhauled and put in first-class condition. E. D. Blackwell, of Brandon, is now interested in the company.

Chatham, N. Y.—The Lindenwald Light, Heat & Power Company, recently incorporated, will supply gas and electricity. The company is capitalized at $25,000. The directors are A. B. Gardenier, S. W. Smith and M. P. H. Smith, all of this place.

Fall River, Mass.—The stockholders of the Fall River Electric Lighting Company have increased its capital from $350,000 to $600,000.

Flora, Ind.—Dr. Ross is preparing to build and operate an electric lighting plant here.

Hagerstown, Md.—The street commissioners of this city will enlarge the municipal electric light plant.

Hailey, Ida.—The Cramer Electric Light Company has been incorporated with a capital of $50,000 by Leo Cramer, John R. Hart and others, of Salt Lake City, Utah.

Halesite, N. Y.—The plant of the Huntington Light & Power Company, at this place, in which many Brooklyn men are interested, is to be enlarged.

Hawley, Pa.—The plant of the Electric Light Company was almost completely destroyed by fire. The loss is estimated at about $15,000.

Hempstead, N. Y.—The town board recently granted the Queens Borough Gas & Electric Light Company the right to extend its poles and wires to almost every section of the township and without reimbursement to the town.

Kirkwood, Ill.—The Kirkwood Electric Light Company has been incorporated with a capital of $12,000 by J. F. White, J. K. Kyler and R. W Houston.

Lake Charles, La.—The city council has ordered an election to decide whether bonds shall be issued to build a new $60,000 municipal electric lighting plant.

Mansfield, Ill.—The trustees of this village have decided to buy the electric light plant recently erected here. The consideration is $7,000.

Monmouth, Ill.—The Monmouth Gas & Electric Light Company of this city, will make a great many improvements in its plant this summer.

Nantucket, Mass.—Buxton & Coleman have received the contract to reconstruct the plant of the Citizens' Gas & Electric Company here.

Odin, Ill.—The citizens held a meeting recently, and indorsed the action of the town board in regard to lighting this village by electricity, the power for lighting to be furnished by the Odin Coal Company. Work will begin as soon as possible.

Paris, Ill.—The electric light committee has been instructed by the council to secure estimates of cost of enlarging the light plant.

Prairie Grove, Ark.—The city council has granted a franchise to C. L. Cummings, for an electric light plant.

Richmond, Va.—E. W. Trafford will report to the special joint committee on the question of erecting an electric light plant for this city. It is thought that the plant will cost about $400,000.

Rock Island, Ill.—It is reported that the village trustees are contemplating installing an electric light plant.

Sayville, N. Y.—The Sayville Electric Light Company held its annual meeting last week when the following officers were re-elected: D. D. White, president; I. H. Green, vice-president; J. A. Nauert, secretary, and Charles N. Aldrich, treasurer. A semi-annual dividend of 3 per cent was declared.

Shreveport, La.—The city council has adopted a resolution ordering an election May 25 to decide the question of municipal ownership of the electric light plant.

South Paris, Me.—Charles S. Humphries, of Madison, a member of the firm of Cook & Humphries, civil engineers, Boston, has been here investigating the different available water powers in view of locating an electric light plant to light this village.

St. Augustine, Fla.—The city council will grant a franchise to an electric light company for the purpose of giving light, heat and power to this city.

Tifton, Ga.—Norman Park will soon be lighted by electricity. A $2,500 plant will be installed within a few weeks.

Wisner, Neb.—The recent special election on the question of issuing $9,000 in bonds for the erection of a lighting system for this village resulted in a victory for bonds.

STREET RAILWAYS.

Columbus, O.—The Wilmington, Jamestown & South Solon Electric Railway Company was incorporated with a capital of $10,000. A. J. Wilson, B. F. Patterson and others are interested.

Frederick, Md.—James H. Ingram, Jr., is interested in the building of the proposed trolley road from here to Baltimore, and says that work will be commenced soon.

Gainesville, Tex.—The Gainesville Electric Railway & Light Company, capitalized at $50,000, will operate street electric railways, interurbans and an electric light and power plant. The incorporators are Edward J. O'Bierne, W. L. Greenhill and others.

Grand Forks, N. D.—S. W. Wheeler, of the Wheeler Land Company, is at work interesting Eastern capital in an electric railway to run from this city to Crookston.

Howell, Mich.—This village has granted a franchise to James and Charles Van Keuren and others, for an electric line from Lansing to Detroit.

Kalamazoo, Mich.—If the proposed electric road between this city and Niles becomes a reality, electric travel between Detroit, and Chicago will follow quickly.

Manistique, Mich.—An electric line between here and Garden will be constructed soon.

Mound City, Kan.—The first survey for an electric line through Linn County has just been finished. The line will run north through a territory not pierced by railroads.

Oceanic, N. J.—The Monmouth County Electric Company is arranging for the extension of its tracks from Red Bank to this place.

Owosso, Mich.—J. W. Thick and O. D. Cooper, of Detroit, have been here looking up the electric railroad situation. They propose to build a line from Pontiac to this city, and thence to Chesaning and Saginaw.

Selma, Ala.—An electric line will be built from here to Marion.

Shepherd, Mich.—The proposed electric road between Grand Rapids and Bay City is likely to touch this place. Col. W. W. Boynton, the promoter, has been in this section in the interests of the scheme and is satisfied that the enthusiasm with which the matter is being received will insure the road for this section. It is now proposed to make Shepherd a distributing point, and a bonus of $5,000 is asked.

Staunton, Va.—A charter has been granted to the Virginia Valley Traction Company with its principal office in this city. H. B. Sproul is president and H. G. McGary secretary.

Utica, N. Y.—W. K. Vanderbilt, Jr., is to become actively interested in the trolley properties in which the New York Central & Hudson River Railroad Company has recently acquired part ownership. It is his purpose to become interested in the development of the trolley system in the Mohawk Valley. He has taken up the matter of electrifying the West Shore between this city and Syracuse.

POWER PLANTS.

Buffalo. N. Y.—The Western Counties Transmission Company has been incorporated with a capital stock of $2,000,000. The directors are: Robert W. Pomeroy, Joseph G. Dudley, Harold G. Meadows, H. T. Ramsdell, Charles G. L. Gurney, Robert W. Chapin and Louis B Hart. all of this city. The company is formed to transmit electric power throughout 25 western counties of this State.

Queretaro, Mex.—This city will this fall install a new hydro-electric power plant to cost over $600,000. The president of the company owning the plant is Francisco G. de Cosio, the goveror of the State, and the manager and principal owner is Ramon Bueno.

BIDS WANTED.

Washington, D. C.—On June 20 the Bureau of Supplies and Accounts of the Navy Department will open bids for furnishing the Mare Island and Puget Sound, Wash., Navy Yards, with the following: Schedule 267, incandescent and arc lamps, carbons, tape; schedule 268, incandescent lamps, insulating rings. Blank forms of proposal can be obtained upon application to the Bureau.

NCTES FOR INVESTORS.

Latest quotations for copper are: Electrolytic, 15@15⅛c.; Lake 15@15⅛c.; casting, 14¾@14⅞c.

Plans are on foot for the reorganization of the Appleyard electric lines.

There are rumors of a forthcoming assessment on Philadelphia Rapid Transit.

Press agents of the Westinghouse Electric Company are talking of a 12 per cent. dividend this year. There was a break of 10 points in the stock on Friday.

Directors of the Philadelphia Electric Company have declared the usual semi-annual dividend of 2½ per cent., payable June 15 to stock of record May 24.

Frank Jacobs, of Allentown, Pa., has been appointed as master to sell the Allentown & Slatington Electric Railway under foreclosure proceedings. The price has been fixed at $275,000, bidders to deposit certified checks for $10,000.

The annual report of the Potomac Electric Power Company of Washington, D. C., shows gross earnings of $723,773, an increase of $79,021 over the previous year. The net earnings amount to $423,514 and the surplus over fixed charges is $283,142.

It is understood that the National Carbon Company directors will meet during the first week in June to consider the matter of further dividends on the common stock. There is talk of another disbursement of 1½ per cent., the same as was made in January last. This would put the stock on a 3 per cent basis.

The first statement of the Sprague Electric Company of New Jersey, which is controlled by the General Electric Company, was recently made public and is as follows: Assets, real estate, $286,809; machinery, $108,283; merchandise and stock in process, $360,167; cash and debts receivable, $439,767; patents, $1; total, $1,195,028; liabilities, capital stock, $1,000,000; accounts payable; $45,305; surplus, $149,723; total, $1,195,028.

Spencer Trask & Co. of New York are offering to investors the 6 per cent. preferred stock of the Milwaukee (Wis.) Electric Railway & Light Company at a price to net about 5 per cent. income. The par value of the stock is $100, dividends being payable quarterly. The issue is absolutely limited to the $4,500,000 now outstanding and is followed by an outstanding issue of $9,000,000 common stock, upon which 5 per cent. dividends are paid.

Application has been made to the New York Stock Exchange to list $489,000 additional common stock of the Twin City Rapid Transit Company. The proceeds will be used for the extension in and about St. Paul. With the issue of the 4,890 shares of treasury stock the total outstanding issue of the common will be $17,000,000. All of the $3,000,000 preferred authorized has been out for some time. This makes the total outstanding share capitalization $20,000,000.

Representatives of the Chicago street railway companies now state that they are willing to sell their properties to the city on fair terms, but require more time to determine their value. They are having figures prepared showing their tangible assets and earning capacity. When these are ready, a meeting between the city officials of Chicago and of the railways will be held to complete negotiations. The traction companies agree to place no obstacles in the way of municipal ownership

EDITORIAL NOTES.

A Tribute to the Electrical Instrument Maker. The pride of accomplishment felt by the progressive and successful electrical engineer is legitimate in so far as it pertains to the influence of his own individuality on the work he has done.

In other respects, it seems as though a rather sluggish appreciation is felt by him for those through whom his victories become possible. It is a simple matter to take a bird's-eye view of the situation and thus to embrace the vastness of the industries inherently electrical, which contribute to the high reputation electrical goods have established for themselves in the open market. The hall mark of fame in this field is exactitude. The peculiar nature of electrical machinery and its allied devices is such that accurate information must be given with them. The rigid specifications of dynamo and motor construction, of arc and incandescent lamp manufacture, of wire making, and in fact all that pertains to up-to-date factory products, are only possible to-day through the magnificent work of our instrument makers. In no other field has American ability so demonstrated its remarkable scope as in this. A tribute to the American instrument maker is without doubt no more than a recognition of the most important influence in electrical manufacturing to which reference can be made.

Exactitude without the aid of these super-senses, would not only be problematic but inherently impossible. As the case now stands, the fineness of art possessed by our most skilled workers is but a crystallization of this fact. The instrument maker, the builder of exact meters by means of which volts, amperes and watts are accurately indicated, has been the healthiest of all influences in bringing about much of our activity. Without these aids we would be working in the dark. The power behind the throne, through which confidence is felt in construction and results, is the maker of fine meters. It is not so long since the difficulty of obtaining accuracy was a general proposition. The exhibitions that took place annually in New York, at what was then called the American Institute Fair, were for a time devoted to displays of electrical apparatus. On one of the tables a Forbes ammeter was to be seen; its inventor, Prof. Forbes, utilized the heated air cast off from a little coil of resistance wire to revolve a small and delicately mounted wheel. The wheel carried small mica blades and as the ascending column of heated air arose, the little windmill rotated and thereby operated a train of gears. The current was thus recorded with what was then considered a fair degree of accuracy. Imagine the conditions of to-day and of that period. Try to realize what it would mean to attempt rough and ready electrical testing with an ammeter of this description. Yet such was the situation in this respect in those days. How fortunate that they have passed. With what good cause should we congratulate ourselves that testing to-day is not what is was then. The merest tyro in electricity can accomplish more in testing than our best experts of the good old times.

* * *

The Increasing Extent of Interurban Lines. City construction now keeps pace with street railway improvements. The inter-relationship existing between civic expansion and street railway enterprise has been admitted by a variety of statisticians. And the increasing extent of interurban lines has been the means of instituting a comparison between the rate of development of municipal growth today, ten years ago, and what might reasonably be regarded as its equivalent ten years hence. Masterly theses have been presented on the subject of municipal development. The pros and cons of civic expansion have been argued down to the ground. All of the complications of city life have been reviewed from a social, moral and intellectual standpoint.

The merchants have been awakened from their lethargy with respect to these affairs, and now it seems as though one vast impulse is actuating the body politic. The drift of thought has been in one direction. It has for its ultimate purpose a hastened growth. The community, as it were, is being forced to agglomerate. The suburbs are stretching out far and wide with extraordinary rapidity. If it can be said that one characteristic is marked in the picture presented by live American cities, it is that their suburbs flourish almost before they do. The outskirts are more quickly threatened with congestion than the older and more staid centers of population.

London is an example of colossal expansion in this respect, and there is no reason to refuse to believe that history will not repeat itself in our case as well. New York now possesses about 4,000,000 inhabitants. London 8,000,000. Even though, as some might say, the floating population is considered in these figures, still the problem must be met of providing adequate accommodations for all. That being the case, in London, interurban lines have mastered the situation. In Baedecker's the length of this great city is reported as equal to 120 miles. Some would call this a State, not a city. Yet the future of Greater New York is such that this immensity may ultimately be dwarfed by it. What then will be the outcome of this in our own case. We have just finished a series of now indispensable tunnels. Others have been projected which will add to the convenience of ready transportation. The die, however, seems to have been cast.

New conditions have compelled the fact to gain recognition. The future of Greater New York is bound up in its interurban lines. As electrical progress dictates advance the cue is followed. Historically, and as evolution has left its mark, the stage coach, the horse car, the cable car, the trolley and now the third-rail system must be remembered. A great responsibility has fallen upon the shoulders of the electrician. The world is anxiously awaiting to see how he will discharge this great mission.

UNDER THE SEARCHLIGHT.

Notes and Comments on Various Topics.

Dr. M. I. Pupin, of Columbia University, New York, has been elected a member of the National Academy of Sciences.

◆

The 51st meeting of the American Society of Mechanical Engineers will be held at Scranton, Pa., June 6-9.

◆

The United States Government has been invited to send delegates to the First International Congress for the study of radiology and ionization to be held at Liege from the 12th to the 14th of September next, under the patronage of the Belgian Government.

◆

Mr. James Dalrymple, Glasgow's municipal tramway expert, arrived in New York on Saturday, and after a reception in this city, given by enthusiastic admirers, left for Chicago where he will discuss municipal ownership with the Mayor of that city.

◆

Another union of street railway employes has been formed in New York and it is said the workers on the Interborough lines may strike again.

◆

Mayor Weaver of Philadelphia has won his fight and the gas lease is dead. The United Gas Improvement Company on Saturday formally withdrew its proposition for a lease. There is now a square chance in that city for electric light companies.

◆

A dispatch from Cambridge, Mass., says a telegram was received at the Harvard Observatory May 27 from Prof. Percival Lowell, director of the Lowell Observatory at Flagstaff, Ariz., stating that the canals of Mars have been photographed there for the first time. Several of them appear upon more than 20 negatives.

◆

A recent letter from London states that "Sir William Ramsey strongly advises that the Government be empowered to send out experts to Cornwall where radium has been found, as the supply of the wonderful substance is nearly exhausted in England—while Austria, the only country where radium is found in quantities, has forbidden the export of it. An ounce of radium is at present worth $900,000. 'Radium is almost priceless now,' said Sir William, 'for the simple reason that we cannot get any from any other country, and we do not exploit the few sources we have here in England. It is a great pity that no radium has been found in the United States, as the energetic people of that country would lose no time in geting it on the market. Sometime ago, however, when radium was one-twelfth its present price, many wealthy private persons bought small quantities of radium to place in their museums, or simply as a curiosity. I think if those people knew how willing we were to pay a reasonable price, that is, probably ten times what they gave for it, they might be willing to come forward and sell it to us. Moreover, they would be conferring a great national benefit by enabling us to continue our researches."

◆

The Massachusetts Legislature has appointed members from both branches to act on a special commission to meet during this summer to consider the advisability of revising the present laws affecting railroads and street railways. The appointment of this committee is the result of the bills before the Legislature this year which met defeat, providing for the purchase of electric street railways by Massachusetts steam railroads and the building of the Boston and Providence trolley road.

◆

At a meeting of the directors of the Westinghouse Electric & Manufacturing Company in New York last Thursday, E. M. Herr was elected first vice-president with executive powers. Mr. Herr has been vice-president and general manager of the Westinghouse Air Brake Company.

◆

A cable dispatch from London to the daily papers says that "a clock that will run for 30,000 years without winding is the latest use to which radium has been applied. The instruments, which are being sold at $50 each, are the invention of H. G. Strutt, and have been put into practical form by a well-known clockmaker of New Cavendish street. The new invention is very simple in construction. One-twelfth of a grain of radium is suspended over a small electroscope consisting of two thin strips of silver. These, being charged with electricity or radio-activity from the radium, move apart until they touch the sides of the vacuum tube in which they are fixed. There they communicate their charge to an aluminum wire which rings a bell and being discharged fall together again to repeat the process indefinitely. The ringing of the bell occurs with such unvarying regularity that the making of the instrument into a time recorder is but a matter of detail. At present the radium clock is made in two forms, one for the magic lantern, the other for the lecture desk to demonstrate the peculiar powers of radium."

ELECTRICITY ON A GERMAN WARSHIP.

The liner "Preussen," which was launched from the Vulkan shipyards in Stettin, Germany, at the end of 1903, and which until very recently was at anchor at Swinemunde, is to be put into service and will be attached to the Baltic marine station this month, says the "Electrical Engineer," London. It has three screws and is about 400 feet in length, 70 feet in breadth and 25 feet in draught, with a displacement of 13,200 tons. It develops a speed of 18 knots, the capacity of her engines being 16,000 hp. The vessel is fitted with a belt armor of 225 mm. and an armored deck of 75 mm. thickness. Her artillery equipment comprises four quick-charging guns of 12-inch gauge, fourteen 7-inch quick-charging guns and twelve of 3¾-inch gauge, twelve 1½-inch machine guns, and eight machine rifles, in addition to six torpedo-launching tubes. Her crew consists of 697 men.

All the internal rooms as well as the upper deck are lighted by electric glow lamps. For use in connection with the scouting service in action or, generally speaking, whenever the enemy is close by, as also for signaling to a distance, there are used four large projectors of 61 million normal candle-power each.

Electromotors are being used extensively for such purposes as conveying ammunition from the ammunition stores to the guns, moving the rotating armored gun-turrets, handling coal, lowering or hauling the large boats, operating the machine tools and refrigerating plant, as well as for driving the numerous fans of different sizes which are installed in all the compartments of the ship.

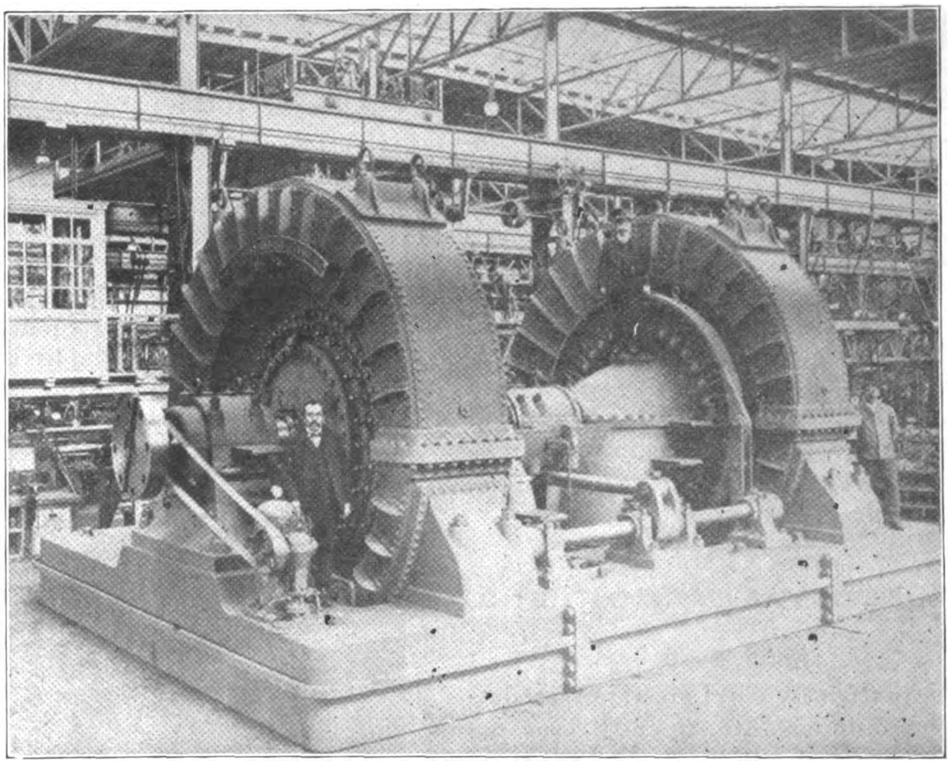
The whole of the apparatus used for the transmission of orders from one part of the ship to another, as well as for mutual communication between different places—i. e., the telegraphs controlling the rudder, engines, boilers, artillery, and torpedo rooms—the optical signaling apparatus for the transmission of orders and intelligence from ship to ship or from land to ship, the telephone and alarm plant, the medical outfit of the infirmaries, and instruments indicating the depth, etc., are operated by electricity.

The whole of the above machinery and apparatus has been constructed by the Siemens-Schuckert Works, which syndicate also installed the two central stations supplying the current for their operation as well as the one required for the "Telefunken" wireless apparatus.

LARGEST ELECTRIC LARGEST WATER TURBINE.

BY RAY HAMILTON.

Two of the most recent and withal interesting notes in hydro-electrical engineering, are the arrival of the largest horizontal water turbine ever constructed, and the installation of the largest electric motor ever built. The first is a gigantic machine of the horizontal inward-flow, double Francis type, and is the first one of 20 that are to convert Niagara's energy into 200,000 hp.



Largest Horizontal Water Turbine Ever Constructed.

This is the first one of four similar turbines built for the Ontario Power Company. The great turbine now assembled was constructed in Wurtemberg Germany, where the others are now being built as rapidly as possible.

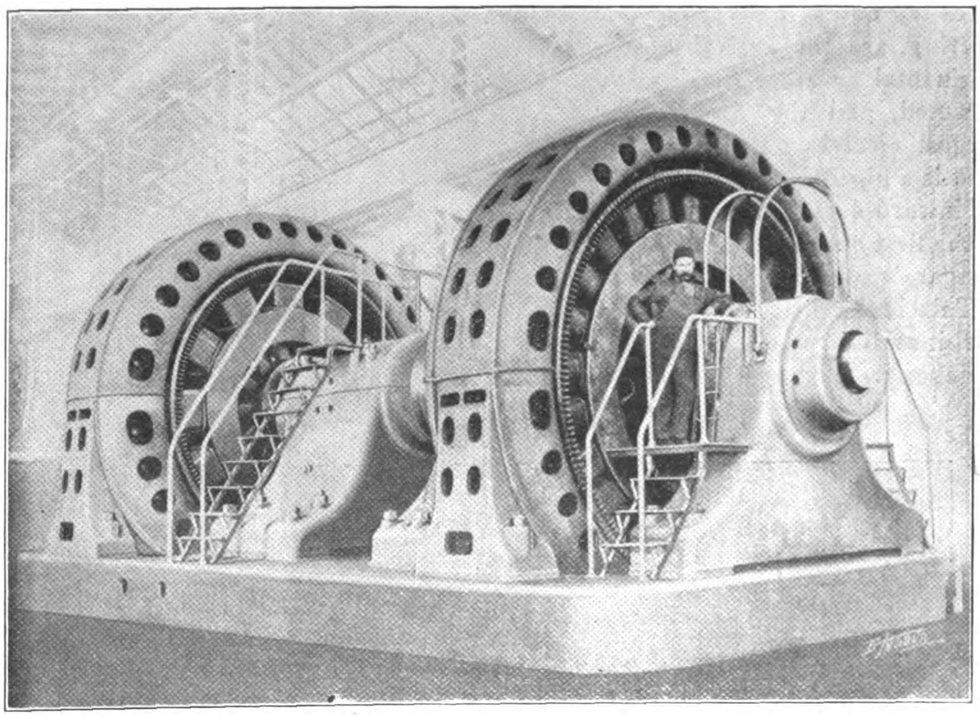
The second machine has just reached Niagara Falls, the third is on its way, and the fourth is nearly finished in the German shops.

Each of these water turbines develop 11,300 hp. when using 700 cubic feet of water per second, and when operating under a head of 175 feet and making 187½ revolutions per minute. In these turbines there are two running wheels, each of which are 78 inches in diameter; water is delivered to these by penstocks 9 feet in diameter and these are brought into the power house below the level of the floor. Where these penstocks enter the building, heavy thrust flanges are embedded in the massive concrete wall, forming as well the foundation of the building. The thrust of the water in the column is equal to 650,000 for each turbine; the latter is set so that the shafts of each are parallel to those of the penstocks and therefore the pipes that furnish them with water, have to describe an arc equal to an angle of 90 degrees on the horizontal, and 45 degrees upward, while each supply pipe ends in a housing of heavily reinforced plates.

Owing to the narrowness of the gorge, the water level of the river varies greatly, and to compensate for this the tail race is separated from the river by a weir with a crest of 7 feet above the normal level of the river. The head of water is made up of 155 feet above the center of the shaft, and 20 feet below it, and the draft tube and tail race below the level of the floor are entirely of concrete. Swivel gates, which act as guides, are also utilized to control the water at the turbines, while these will be regulated by Lombard governors; each penstock has a relief valve, which discharges into the tail race.

The largest electric motor in the world has just been installed in the power house of the Shawinigan Water & Power Company in Canada. It is a synchronous motor developing 8,000 hp., while the generator, which is direct connected with it generates 5,750 kw. when running 300 revolutions per minute.

The motor and its complementary generator are not only exceedingly large machines, but their combined rated capacity of 12,000 kw. seems little short of marvelous when the exceedingly limited floor space is taken into consideration. This brilliant example of electrical engineering skill was constructed by the Allis-Chalmers Company at its Cincinnati (Bullock) Electrical Works, and tested by the Behrend system in the shops with an expenditure of only 300 kw., and which effected the same losses the motor-generator would indicate under full load conditions, and would be equivalent to 72,000 kw. on the generator. The photograph was taken at the time the test was made.



Largest Electric Motor Ever Built.

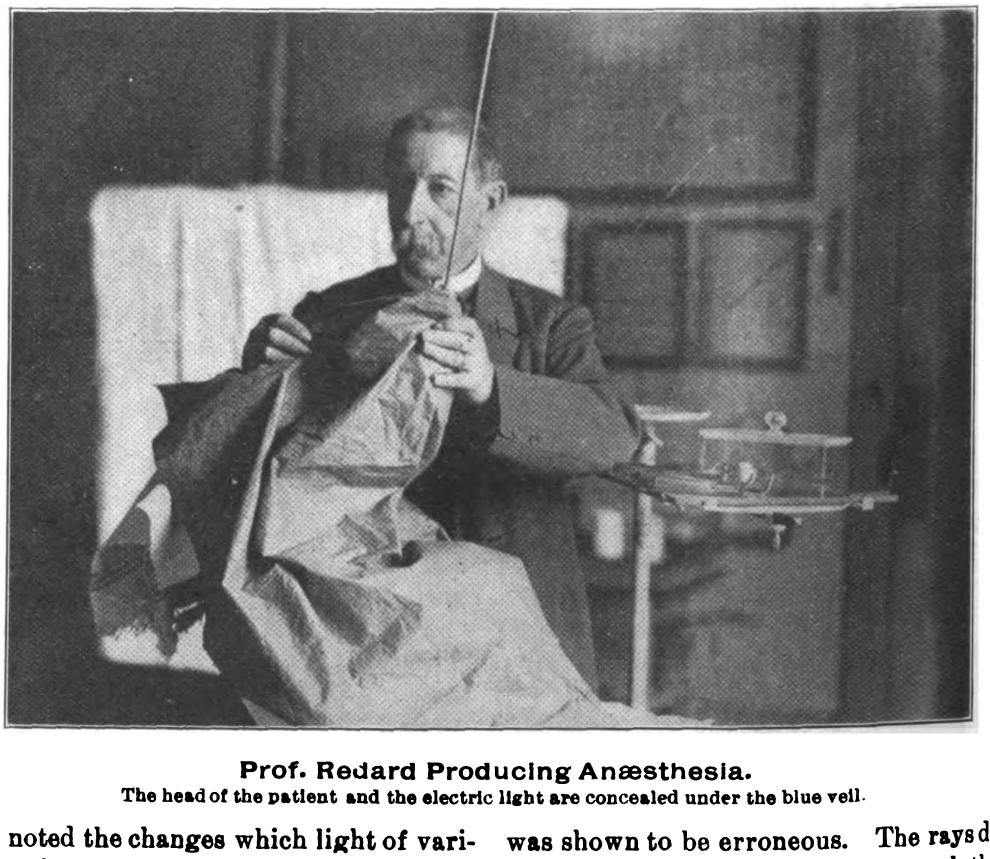
BLUE LIGHT AS AN ANÆSTHETIC.

BY C. SMITH.

An extremely novel process of producing anæsthesia has recently been devised by a Swiss doctor, Prof. Redard, of Geneva. The method itself is a very simple one and entirely harmless, being used by the professor for minor operations in dentistry, such as removing teeth, entirely doing away with the use of nitrogen monoxide or laughing gas, ether and chloroform.

A blue electric light of 16 cp., a dark blue veil or sheet and a nickel reflector are all that is needed. The patient is placed in a reclining position with the head entirely covered with the blue veil and the light underneath the sheet about 6 inches from the subject's eyes. By intently looking at this light the pupils immediately begin to dilate and in three minutes the operation can be performed without any pain being felt, the patient, on awakening, stating that he remembers nothing whatever during the time he was under the influence, and in one case even demanded to see the tooth in order to be convinced that it had really been extracted.

In an address to a medical society, the doctor stated that he had begun the study of the action of the primary colors, red, yellow and blue, and their complementary colors on inorganic and organic bodies. He noted the changes which light of various colors produces on different chemical compounds, as well as the influence which light has on both plants and animals, such as the differences in the color of the former, depending on whether they grew in the shade or sunlight; and the effect of climate on both habits and character of man and animals; the southern countries with their love for bright, gay colors and the north with its more sombre and dark colors. He concluded that heat and light were the cause. Inasmuch as various scientists, such as Flammarion and Finsen, had already shown the action of various rays on animals, he began his investigations along somewhat similar lines, noting that various colors produced different effects. For instance, red had a very disagreeable action, producing intense excitement; yellow, melancholy and mental depression; blue, calmness and quiet; while their complementary colors produced depending upon the predominating primary color. The doctor ascertained that blue was the most suitable for his use, although both green and violet could be used. In his experiments he has met with a fair degree of success. About 20 per cent. of his trials were, however, failures, and this he attributes to the fact that "the patient did not fix his eyes steadily upon the blue light," but insisted on closing them.



Prof. Redard Producing Anæsthesia.
The head of the patient and the electric light are concealed under the blue veil.

A hypnotic effect was at first thought to be the cause of the sleep produced, but inasmuch as red light or yellow light, for example, produce, under the same conditions, totally different effects, this theory was shown to be erroneous. The rays do act, however, upon the brain through the optic nerve, in some manner producing anaesthesia. The same method has been tried by various colleagues of the professors who have also obtained good results.

The patients have only been under the

influence of the light for a short time, and in consequence whether or not this method can ever be used for more important surgical operations is extremely problematical.

A NEW BATTERY SWITCH.*

A serious objection to the ordinary charge and discharge switches is the large number of heavy copper connections between the battery and the switch which they necessitate, and many attempt's have been made to reduce this number of connections. One way of doing this consists in connecting several cells, instead of only one cell, between each pair of switch contacts, and then reducing the voltage variations to 2 volts by means of auxiliary cells. This method, however, involves difficulties in charging the auxiliary cells, as these must either be charged separately from some independent source or else the whole battery must be quite disconnected from the bus bars during the charging period. A better method consists in using a few of the cells from the other end of the battery in place of independent auxiliary cells, and in a paper recently read by Herr C. Liebenow before the Elektrotechnischer Verein (E. T. Z., May 4, 1905) the theory of this method is considered in some detail.

An installation of this type has been at work for some time at the Paris terminus of the Northern of France Railway. In this case two cells are connected between every pair of contacts on the main cell switch, whilst a single cell at the other end of the battery is connected to a second switch and every time the main switch is moved this auxiliary cell is either inserted or withdrawn automatically.

Fig. 1 shows diagrammatically the connections of a battery installation arranged on this principle. At the right hand end of the battery, every fourth cell, for instance, is connected to the main cell switch Z, while at the left-hand end three consecutive cells are connected to the auxiliary cell switch H by means of four conductors. The mechanical interconnection of the two switches is not shown. In order to vary the circuit voltage between J_1 and J_2 by steps of 2 volts only, the auxiliary switch alone would be moved at first so as to cut out a single cell at a time, the main cell switch remaining fixed. After all the three auxiliary cells had been cut out the next step would consist in moving the main switch over one contact, and, at the same time, moving the auxiliary switch back on to the last cell of the battery. These two movements should take place as nearly as possible simultaneously in order to avoid fluctuations in the lights. In this cycle of operations it will be seen that the auxiliary switch first makes three steps of 2 volts each and then one of 6 volts, so that if the short-circuiting of the cells were prevented by means of the ordinary resistance inserted between the front and back parts of the contact arm, this resistance would be very unequally loaded at the different steps. The difficulty can be easily overcome, however, by returning to the older type of cell switch, in which the double contact arm is replaced by intermediate resistance contacts introduced between the main contacts (see Fig. 1, H).

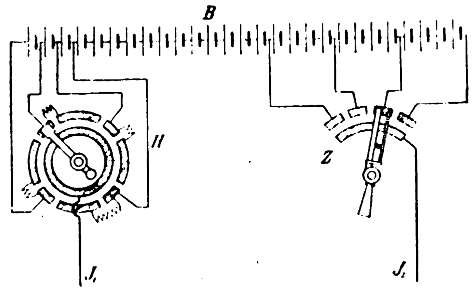


FIG. 1.

A simple formula for deciding the best number of cells to be placed between each pair of main switch contacts, in order to reduce the number of connecting leads to a minimum, is given by Herr Liebenow:

Let N = maximum number of cells to be cut out.
H = number of auxiliary cells.
L = number of connecting leads (including the leads at both ends of the battery).

Then $$L = \frac{N + H^2}{H + 1} + 2.$$

is the general formula, applicable both to the case in question and to the ordinary method of cell switch connection (where $H = 0$, of course). From this expression it is easy to show that, for a given value of N, L will be a minimum when $H = \sqrt{N+1} - 1$. Thus, in the case of a battery requiring a total of 35 regulating cells (a variation of 70 volts), the number of connecting leads between battery and switch with the ordinary type of cell switch would be 37, whilst with the new arrangement, if H is made equal to $\sqrt{N+1} - 1 = \sqrt{35+1} - 1 = 5$ auxiliary cells, the total number of leads will be $L = \frac{35 + 25}{6} + 2 = 12$, or a saving of about two-thirds of the copper as compared with the ordinary arrangement.

The way in which the number of leads varies with H may be seen from the following tables, giving the number of leads for various values of H for batteries having 57 and 20 regulating cells respectively:

57 Regulating Cells.

H		L
0	(Ordinary cell switch)......	59
1	" " "........	31
2	" " "........	23
3	" " "........	19
4	" " "........	17
5	" " "........	16
6	" " "........	16
7	" " "........	16
8	" " "........	16
9	" " "........	16
10	" " "........	17

20 Regulating Cells.

H		L
0	(Ordinary cell switch)......	22
1	" " "........	13
2	" " "........	10
3	" " "........	10
4	" " "........	10
5	" " "........	10
6	" " "........	10
7	" " "........	11

It will be seen that the change from no auxiliary cells to one auxiliary cell produces the most marked saving in leads, and after that the saving affected by each additional auxiliary cell gets less and less until a minimum (not very well defined) is reached. The maximum saving, as compared with the ordinary arrangement, is greater, the greater the number of regulating cells.

Whether it is advisable in any particular case to employ the number of auxiliary cells giving the maximum saving in leads depends on the constructional details of the switches and on the actual size of the conductors required, because, of course, it is the minimum combined cost of switches and leads and not simply of leads alone which is desired. In the case of cell switches of the ordinary type, with a large number of contacts, it is probable that the new type of double switch would come out the cheaper because of the reduction effected in the number of contacts.

Wireless System for Pacific Coast.

A wireless telegraph system, embracing the Pacific Coast from San Diego, Cal., to Bremerton, Wash., will be installed during the summer. Stations will be erected at Cape Mendocino, Point Arguello, Point Loma, Cape Blanco, North Head, Cape Flattery, Point Wilson and the Puget Sound Navy Yard. The stations will be so situated that vessels cruising off the coast will have a communicating range of about 100 nautical miles from shore.

---

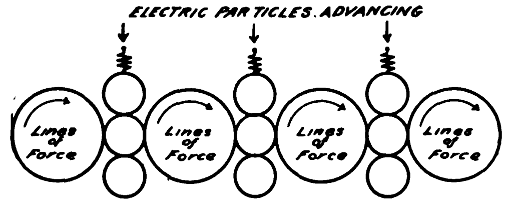
ELECTRICITY LEAFLETS.

BY NEWTON HARRISON, E. E.

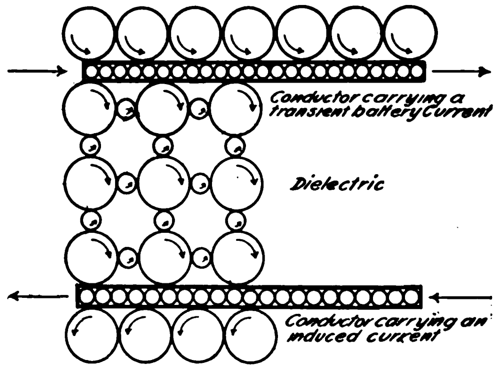
TELEGRAPHY WITHOUT WIRES.

The Origin of Wireless Telegraphy.—In speaking of the origin of wireless telegraphy it is necessary to begin at that point in its history which might properly be called the first suggestion. On this score many arguments may arise, presented on the one hand by the physicist and mathematician, and on the other hand by the practical inventor. It is generally acknowledged, however, that the first correct analysis of the conditions which gave rise to that which is called wireless telegraphy were made by Hertz. It can also be admitted that the influence which guided him in his experiments was Clerk Maxwell. What is there in the work of either of these great thinkers that led to such momentous results as those recorded in the history of wireless telegraphy? To begin with, the basis of Maxwell's mathematical investigations, was the long series of epoch-making experiments by Michael Faraday. The point which arose first in the minds of both men, was whether electrical actions took place in the conductor or the medium surrounding it. In other words, whether electrical effects take place through the intervention of a definite mechanism—or, to be still more explicit—whether the lines of force emanating from any center of electrical disturbance are not the connecting links between the first manifestation and whatever secondary or tertiary effects may follow. It is quite evident that as the study of wireless telegraphy is only a practical proposition, because of the possibility of throwing out into space an influence or waves that produce signals at distant places, it is necessary to examine as closely as possible the meaning of such an experiment in order to understand more fully the limitations of this new art of signaling. The general conclusion arrived at by Maxwell was that of the existence of a universally diffused medium called ether. Of the nature of this substance nothing is known, yet it is acknowledged to be that through which all energy is transmitted; and in this respect it is of particular interest to electricians because of the form of electrical energy it seems peculiarly adapted to carry.

Hertz's Experiments.—According to the ideas of Maxwell, an electric current is due to the *displacement* of electricity; in other words, Maxwell looked upon electricity as an actual thing, a something that had to be displaced to manifest itself. He therefore came to the conclusion that two influences were at work, one which was called a line of force and the other the electric particle. The electric particle acted as a transmitting gear between two larger gears, which were the power carriers. The picture presented would be that of an alternate series composed of a large gear and a small gear, a large gear and a small gear, etc., the larger gear being the line of force, the small gear the electricity. The next feature in this theory is that of remembering that the larger gears tend to thrust forward or displace the smaller gears while using them as transmitters of their rotations.



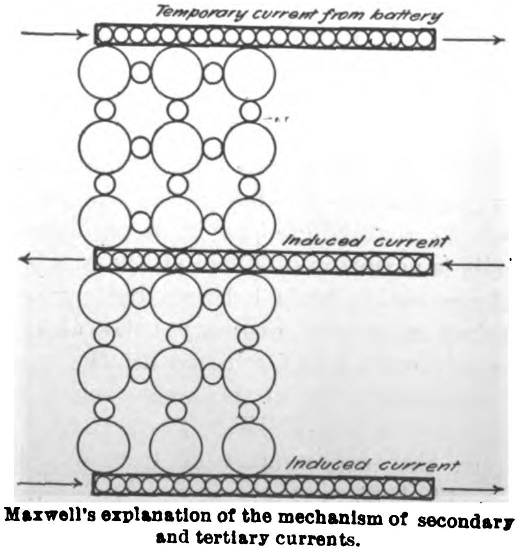
Rotating magnetic vortices, showing how electric displacement occurs according to Maxwell—the dielectric holding the electric particles in place.



Conductor carrying a transient battery current
Dielectric
Conductor carrying an induced current

Sketch showing electro-magnetic induction between two wires, the Maxwell mechanism accounting for the induced current by means of the electric particle and magnetic vortex.

A temporary displacement would exhibit itself as a temporary flow of electricity. A continuous displacement would appear in the form of a constant current; thus the mechanism postulated by Maxwell simply consists of the relative actions and reactions between two sets of unslippable molecular or atomic wheels, so to speak. He was able, on this basis, to advance certain formulas by means of which, on the supposition that the medium transmitting electrical influences is elastic, to calculate the speed with which disturbances would be propagated.



Maxwell's explanation of the mechanism of secondary and tertiary currents.

The formula given for an elastic medium, such as the ether, by which this speed of propagation is ascertained, is: Speed of propagation = the square root of the effective elasticity ÷ the density. This simple formula appears as $v = \sqrt{\frac{e}{d}}$

where v = velocity of propagation in the ether,
e = effective elasticity,
d = density.

The value of e and d may be better understood as follows: In a medium like ether, which transmits electrostatic and electro-magnetic disturbances the *electro-magnetic density* must be given. Its value is $d = 4\pi\mu$, where μ = the magnetic permeability and $\pi = 3.1416$. In addition it must be known that the effective elasticity of the ether or the dielectric is equal to $4\pi \div K$, where π as before = 3.1416 and K = the specific inductive capacity.

Arranging these symbols in the proper manner gives the following result:

If $v = \sqrt{\frac{e}{d}}$

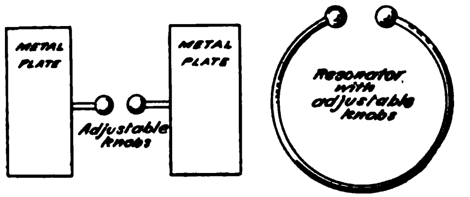
and $e = \frac{4\pi}{K}$ and $d = 4\pi\mu$, then substituting

$$v = \sqrt{\frac{4\pi}{K}} \div \sqrt{4\pi\mu} = \frac{1}{\sqrt{K\mu}}$$

This last formula is a statement that the velocity of propagation of a wave of electric or magnetic disturbance is equal to the square root of the reciprocal of the product of its specific inductive capacity and its magnetic permeability (see Fleming's Alternate Current Transformer).

These conclusions, based upon a mechanical conception of the process taking place, are not to be regarded as conclusions drawn from actual operation of the true mechanism. The mechanical interpretation by Maxwell is an ingenious hypothesis which in many ways presents a method of transmitting electricity that will be hard to replace. It also explains the means by which waves are propagated, including the magnetic and static. The development of wireless telegraphy rests largely upon the application of correct principles to the problem. No one has been of greater importance in this respect than Dr. Hertz, who subsequent to Maxwell's time attempted the demonstration of some of the propositions indicated by him in his mathematical investigations. His labors were confined to a determination of the velocity of propagation of electric waves superinduced by electrical oscillations in condensers. It is interesting to glance over the ground covered by him in his efforts to throw light on this subject and the remarkable discovery made in consequence of his close attention to all the results obtained.

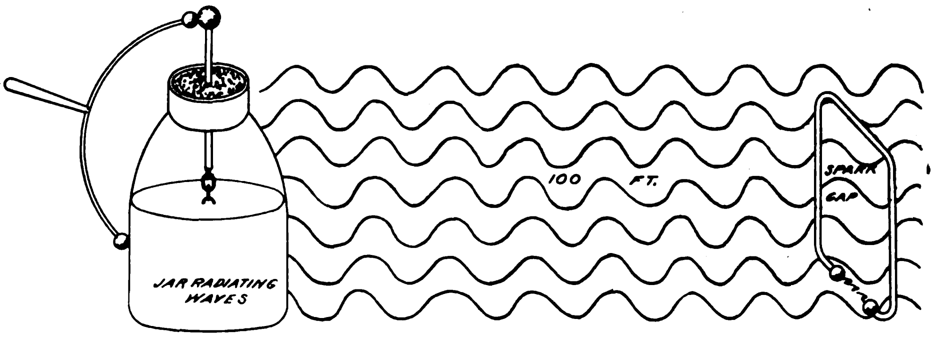
Hertz's Discovery.—During experiments, conducted for the purpose of ascertaining the velocity with which electric waves move through space, Hertz discovered sparks at various points in his circuits which were strongest where the wall seemed to act as a reflector. He was able to trace the reflected waves and to measure them, and arrived at the astounding conclusion that conductors carrying an oscillating current were throwing out into space waves in every respect similar to light though invisible.



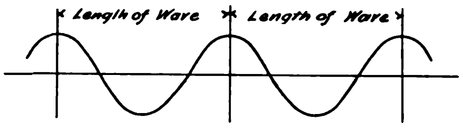
Apparatus used by Hertz for investigating electric waves.

The First Use of a Spark Gap.—Hertz employed for the purpose of localizing and *seeing* these waves a resonator, as it was then called. It consisted of a metallic circuit broken at one point by a *small air gap*. He was able to refract these waves by means of a prism of pitch through an angle of 22 degs. He found that metal screens were opaque and wooden doors transparent to the waves. By means of mirrors of sheet zinc the light was reflected and focused. In other words, it was clearly established by his experiments that oscillating currents threw off or radiated great waves in the luminiferous ether, waves which to-day are employed by famous workers in the field of wireless telegraphy.

Producing Electric Waves.—It is a simple experiment to set a Leyden jar in the middle of a large room and after charging it to suddenly discharge it. The effect of this process is to throw out from the jar an immense number of electric waves. It is in every respect the same as though a powerful source of light was suddenly turned on for an instant. Waves are generated by this method whose length and number per second are dependent upon the capacity of the Leyden jar and the resistance of the circuit through which it is discharged. If the resistance of this path is high the number of waves or oscillations will be reduced; the lower the resistance of this path the more rapidly will the oscillations increase. In cases where these results have been calculated the waves have exceeded many millions per second. Visible light represents vibrations of the ether, reaching up from 400 to 700 billion per second. Electric waves only reach into the millions per second. Therefore, the upsetting of a condenser or Leyden jar discharge means the development of vibrations which occupy a position midway between rapid aerial and visible light vibrations.

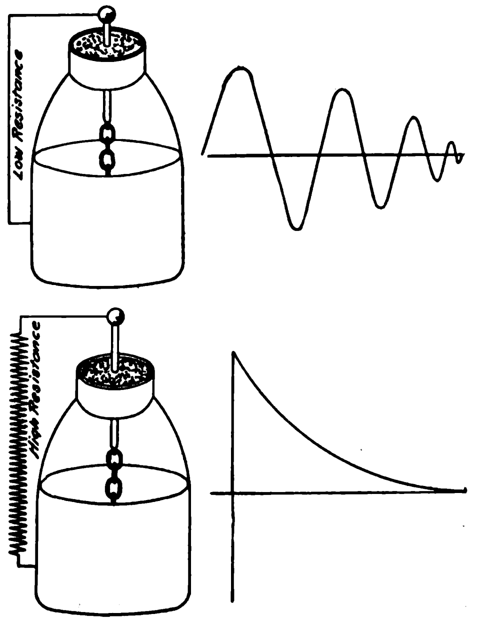


Principleof wireless telegraphy illustrated with Leyden jar and spark gap in path of waves and development of spark at a distance.



Method of measuring waves.

Resistance in Series With a Condenser.—When the inductance of a circuit in series with a condenser is given in henries and its resistance as well in ohms, then if the capacity is given, oscillations can be predicted on discharge. If the resistance in ohms is *greater* than the square root of 4 multiplied by the inductance, divided by the capacity, there will be *no oscillations* and consequently *no waves*. If the resistance in ohms of the circuit is *less* than the square root of 4 multiplied by the inductance and divided by the capacity there will be oscillations and therefore waves.



Discharge curve, showing oscillations from jar through a low resistance, and dying away of charge through a high resistance.

The Number of Waves a Second.—To calculate the number of waves a second the following items must be known.

First—The resistance in ohms = R.

Second—The capacity in microfarads = K.

Third—The inductance in henries = L.

The formula employed is one in which these values are correlated as follows:

$$2 \times 3.1416 \times \text{number of waves} = \sqrt{\frac{1}{KL} - \frac{R^2}{4L^2}}$$

If the resistance R is very small, so as to be negligible in fact, the formula becomes transformed into the following:

$$\text{Waves per second} = \frac{1}{2 \times 3.1416 \times \text{sq. root of } (K \times L)}.$$

Length of a Wave.—If the number of waves per second are known, then it is simply necessary to divide this number into 186,000 miles or its equivalent 3×10^{10} centimeters, the velocity of light per second. For instance, if by the above formula calculation showed a number of electric waves equal to one million per second, then $3 \times 10^{10} \div 10^6$ would give 3×10^4, or 30,000 centimeters for the length of each wave. If the number per second equalled 100,000,000 then each wave would possess a length of 300 centimeters, about 120 inches.

TELEPHONE TRAFFIC.[*]

BY HERBERT LAWS WEBB.

A paper on telephony before this Institution is under a certain disadvantage because it is difficult to tell the earnest telephone men anything about telephony that they do not already know and it is difficult to tell the non-telephone men anything about telephony that they care to know. In attempting to describe the improvements that have been made in the conduct of telephone traffic and to indicate the relation between traffic efficiency and engineering economy I shall hope at the least to provide a topic for discussion which may interest those members who are not directly engaged in telephony as well as those who are.

---

[*] Abstract of paper read before the British Institution of Electrical Engineers, May 11, 1905.

I have always held that the study of the traffic is the most important part of a telephone man's work. The chain of reasoning which leads to this conclusion is simple. The sole object of a telephone system is to supply telephonic communication, and telephonic communication consists of hundreds or thousands, or hundreds of thousands, of daily telephone connections. Each connection consists of a certain number of operations involving a definite performance by apparatus and by a manipulator, therefore the principle aim of the telephone engineer should be to put the apparatus and the manipulators in a position to execute those various operations with maximum accuracy and celerity. The efficiency—efficiency here meaning accuracy combined with celerity—of the individual connection is the object to be attained, and efficiency of the connection requires efficiency in each step.

Even if the result were solely the supply of the most effective service possible to the public, the accurate and rapid production of the individual connection should be the chief solicitude of the telephone engineer. But the matter goes much deeper than that. It affects the whole engineering design of the system, and it affects both the capital charges and the working costs. Any gain, however slight, in the accuracy or the rapidity of manufacturing the individual telephone connection is felt throughout the whole system. It reduces the size of the plant in proportion to output and so reduces capital charges, and it reduces the amount of work done in proportion to output and so reduces working costs.

I have read somewhere a remark, attributed to a famous member of this Institution, which aptly illustrates the point. Sitting on a mountain side, he said—"I let fall this grain of sand, and the whole earth feels the shock." Telephone men might well use this as a text. If in a telephone system, where hundreds of thousands, sometimes even millions of operations are performed daily, we make any one of those oft-repeated operations more accurate or more rapid, the whole system feels the effect. The gain of a second, or of a fraction of a second, on an operation many times repeated each day, has, in a large telephone system, a cash value running into handsome figures.

The importance of the study of telephone traffic, then, cannot be over-estimated and it is clear that the efforts of all who are engaged in the design and conduct of telephone systems are ultimately focused on the production of accurate and rapid telephone connections. There are many different functions to be performed in a modern telephone system, as there are in a modern battleship, but the true function of the battleship is straight and rapid shooting, and the true function of the telephone system is straight and rapid operating. The cook of the battleship does his share in straight and rapid shooting by keeping the gunners' digestions in order, and in the telephone system even the humble wayleave officer or the storekeeper has his indirect share in the production of accurate and rapid operating.

The improvements in telephone exchange apparatus during the past 10 years have been revolutionary. The history of telephone exchange working, covering now about 25 years, may be roughly divided into two periods—one of about 16 years in which the apparatus was mainly experimental and many different systems were tried, but none was produced capable of dealing with a large daily traffic with real accuracy and rapidity; and one of about 8 years, in which there has been perfected and standardized apparatus, largely automatic in its working, capable of the greatest accuracy and rapidity in operation. In the old apparatus the percentage of error was very great, owing to the distances between the signals and the jacks and plugs they were related to, and owing to lack of definiteness in some of the signals—on many occasions they worked at the wrong time and on others they failed to work when required to. With regard to rapidity of operating, the old apparatus was relatively slow in working for a variety of reasons. The distance between the signals and the jacks and plugs imposed a certain strain on the operator's attention and memory, the replacement of signals occupied time and the lack of definiteness of some of the signals and the total absence of some essential signals necessitated a certain amount of supervision of each connection by one or more operators to insure a reasonably accurate and satisfactory service.

In the standard apparatus of to-day all these conditions have been changed. The use of lamp signals enables many things to be done which were impossible before. The prime advantages of lamp signals are that they are extremely compact, they have no working parts, and therefore may be placed in any position, vertical, horizontal, or at any angle; they are automatic in action or self-effacing, since the signal disappears immediately the current is cut off; and finally, they give a much more positive and assertive signal than any form of indicator. These various qualities enable several radical improvements to be made. The signals are placed immediately adjacent to the jacks or cords they control, which, in large switchboards, is impossible with electromagnetic indicators; the line lamp is immediately above or below its corresponding answering jack and the supervisory lamps are in line with the connecting cords and close to them. With this arrangement the operator loses no time and has to exert no brain-power in tracing the relation between the signal and its corresponding jack or cord. The difference in effect between the modern arrangement of directly associating the signals with their corresponding jacks and cords and the old arrangement of placing the signals in a separate part of the board from that occupied by the jacks and cords is something akin to the difference between a telegram in plain language and one in code. In the one case the meaning of the signal flashes instantly to the brain of the operator, and in the other case a certain effort, and a certain interval of time, are required for translating the meaning of the signal. The automatic working of lamp signals is of much wider range than that of electromagnetic signals. We had self-effacing, or automatically restored, indicators before lamp signals were introduced, but the self-restoring indicator had but two positions—only two words in its vocabulary, so to speak. The lamp signal has several; it may be alight or out, corresponding to the down and up positions of the indicator, but it may also flash and it may be made to flash at different rates of speed, easily recognizable. Therefore, apart altogether from the fact that it is much more easy to apply to lamps distinctive marks indicating different classes of service than it is to apply such marks to indicators, the lamp signal is able to convey a greater number of meanings as a working signal than an indicator. Finally the more assertive and positive signal given by a lamp as compared with an indicator is due to a simple physical fact—the great sensitiveness of the eye to light. The glowing of the lamp signal instantly attracts attention, no matter at what angle the lamp may be relative to the eye, and in many cases the lamp is seen instantaneously where a fallen drop would be unnoticed for several seconds. The lamp is seen out of the corner of the eye, so to speak, whereas an indicator must be more directly in the range of vision.

Perhaps the most striking improvement in operating resulting from the use of lamp signals and the supply of energy from a central source is automatic supervision. In the older systems of working, as has already been said, the indefiniteness and unreliability of the signals made it necessary, in order to reduce as far as possible the percentage of error, that the operator should give each connection a certain amount of supervision. This supervision was directed to ascertaining that the two subscribers had got together all right, and later, in the many cases where the disconnection signal was not given, of ascertaining whether the subscribers had finished talking and the lines could be disconnected. This supervision demanded a certain amount of the operator's time on each connection in excess of the time actually required for the operation of the connection. In the modern switchboard the exact condition of the two subscribers' lines connected is shown by the state of the two supervisory lamps associated with the connecting cords. By the automatic working of these two signals the operator knows when the called subscriber answers, she knows when one subscriber hangs up and the other does not; she knows if either subscriber wants her to come in on the line, and finally she knows when the two have hung up. The operator sees these various conditions of the line by the action of the two lamps and she requires to do no direct supervision. If either subscriber desires to attract her attention he flashes one of the supervisory lamps by moving his switch-hook up and down, and it is only on this signal that the operator goes into the circuit. The automatic supervision and the automatic and definite disconnection signal afforded by the double supervisory signals constitute an immense advance in the means of handling telephone traffic.

The general supervision of the service becomes much more effective with standard apparatus because the lamp signals are much more easily observable by the supervisors than indicators are. Standing behind the operators at a relay switchboard one can practically follow every movement of the subscribers' telephones; a line signal unanswered or a pair of supervisory signals unattended to glare insistently until the operations demanded are performed. The supervisor's attention is instantly called to any unusual rush of calls or to any difficulty or delay.

The constant observation of the traffic is the measure which has contributed most to the effective use of modern apparatus and to the attainment of a high standard of efficiency and accuracy in the operation of a large daily volume of telephone traffic. It is only by making continuous tests on a certain proportion of the daily traffic, noting not only the time of every step, but the method and manner of conducting every part of the operation, that sufficient information can be gained of operations involving so much detail to enable defective methods of operating to be eliminated or checked, and suggestions to be evolved tending to a general increase of efficiency.

Some idea of the complexity of telephone traffic may be had from the fact that the form for recording these service observations contains 42 columns, each with its appropriate heading. An entry in each of these columns would not be made for a single call, but the test of one connection might require notes in a fair proportion of the columns, and even if but very few entries are made, each test or series of observations contributes its quota of information relative to the speed, the accuracy and the general efficiency of the service. To set all these observations out on a diagram would hardly be interesting, and I will only say that the observations give the time, in seconds and fifths, of every step of the connection, whether effective or ineffective, and if ineffective from what cause—engaged, don't answer, cut-off, wrong number, subscriber left instrument, etc. the mistakes and omissions of the operator or the subscriber, for even telephone subscribers are known sometimes to make mistakes—and in short, every ordinary vicissitude that the telephone connection is subject to. The information gained by a large number of tests of this kind, in which observation is made of every detail in the brief history of the telephone connection, is of enormous value in bringing to light the weak spots in the service, whether they may be due to defects or faults in the plant, to slowness, inattention, lack of operation or lack of method, or erroneous methods on the part of the operators I hardly like to hint that there may be sometimes lack of method or erroneous methods on the part of the users of the service who may thus contribute to the errors and delays which sometimes occur in the daily stream of telephone traffic; but if there be, continuous service observations will reveal them and measures may then be taken to suggest such reforms as seem advisable.

To secure speedy and accurate operation of the vast volume of traffic which flows daily through a large telephone system requires first, that the apparatus used have signals of definite meaning, that the working of the apparatus be largely automatic and that the apparatus be of uniform type throughout the system; second, that the operators be thoroughly trained in the manipulation of the apparatus and in the methods of dealing with all varieties of calls before being intrusted with the conduct of actual traffic; third, that the operators be continuously trained to active co-operation with each other, so as to produce general efficiency, and to accuracy and method in every detail; fourth, that a constant study be maintained of the actual conduct of the traffic, directed to the improvement of the standards of accuracy and speed.

◆

DUPLICATION OF ELECTRICAL APPARATUS TO SECURE RELIABILITY OF SERVICE.*

BY H. W. BUCK.

The question of the proper reserve in an electrical installation is a problem that, like many engineering problems, must be settled largely upon a basis of cost. It is nearly always a question involving a balance between a power company's obligation to its customers and the obligation to its stockholders. From the standpoint of the consumer the more reserve the surer will be his supply of power. On the other hand, to the power company's stockholders the less the investment in reserve the larger the dividends, unless the reserve has been cut down to a point where the power company's reputation is endangered by interruptions to service. The question is purely a practical one and no definite laws can be enunciated, nor can any curves be plotted which will indicate the proper amount of reserve to be installed under various conditions. The decision in each case must be based on intimate knowledge of the local conditions and requirements of the particular installation in question. All that will be attempted in this paper will be a discussion of the general principles involved.

For purposes of discussion electrical reserves may be divided into several classes of apparatus, each governed by different conditions. These classes are:

1. Generating units.

---

*Abstract of a paper presented at the 197th meeting of the American Institute of Electrical Engineers New York, May 6, 1905.

2. Generating plant switchboard.
3. Generating plant transformers.
4. Underground distribution system.
5. Overhead lines.
6. Sub-station apparatus.
7. Apparatus on premises of individual customers.

Reserve apparatus applicable to the above can again be divided into two classes.

a. Actual apparatus installed complete ready for service.
b. Reserve parts held in storeroom.

GENERATING UNITS.

There is no place in a power system where reserve apparatus is so important as in the generating station. In the writer's opinion the following conditions should be observed in every large generating plant where continuous service is demanded; the maximum overload capacity of the generators normally operating on the bus-bars should be such that at any time and under any conditions of load any one on the generators can be instantly disconnected from the bus-bars without necessitating a reduction of station load or causing a serious momentary drop of pressure. If any trouble, either incipient or actual, should then develop in one of the generating units, the unit can be immediately put out of service without waiting to start up another machine to take its place. Furthermore, there should, if possible, be one unit held as absolute reserve which need not be operated except as a substitute. This enables any one generator to be out of service for repairs, even during load-peaks. The size of generating unit selected for an installation has an important bearing on the question of reserve. The larger the unit the lower the cost of the plant per kilowatt, but, by necessity, the larger will be the investment in the idle reserve machinery. The proper relation can only be determined by a study of the local conditions under which the plant is to operate.

A station operated by steam-turbines or by water power has certain advantages in reserve conditions. With steam turbo-generators, on account of the comparatively high part-load efficiency of the steam-turbine, all the units installed in the plant, including the reserves, can be kept in operation on the bus-bars at all times without serious sacrifice in steam economy due to the part load on each unit. This enables a generator to be quickly disconnected from the bus-bars at any time without overloading the remainder, or causing a serious drop in pressure. This condition also obtains in a water power plant since the additional use of water caused by the continuous operation of the reserve units has only little effect on the cost of producing the power. With a reciprocating engine, however, each unit must be operated as far as possible at exactly the full-load point on account of the economy required in steam consumption. This prevents obtaining the full utility of the reserve machines.

The exciters in an alternating current generating station are of course the heart of the entire system, and the most careful provision should be made to insure continuity of service therefrom. Since the cost of the exciters is in every case only a small proportion of the cost of the plant there is little excuse for not installing ample reserves in connection with the exciter equipment.

Of equal importance with the complete reserve machinery installed is the stock of reserve parts held in the storeroom. There should be kept on hand at all times ready for immediate use a complete outfit of the parts of the prime-movers and generators which are most likely to wear out or break down.

GENERATING PLANT SWITCHBOARD.

Under this heading might be included all of the electrical equipment of the station from the terminals of the generators to the point where the outgoing feeders leave the power-house. This will necessarily involve a large amount of cable as well as all of the switch equipment and controlling appliances. Here the question of reserve is almost wholly a storeroom proposition. In the writer's opinion, the actual installation of duplicate cables in the station wiring and duplicate switches, controlling devices, etc., should be avoided as far as possible, as tending to occupy too much valuable space and to complicate the organization of this vital part of the plant. There should, however, be kept on hand, preferably in the power-house itself, the fullest inventory of switch parts which are liable to injury, and full lengths of all sizes of cable used in the installation. The duplication of bus-bars is of course quite necessary in a generating plant, but more for reasons of flexibility of operation than for reserve. Bus-bar installations as now constructed are less liable to breakdown than almost any part of an electrical system. A great deal can be accomplished toward reserve in the case of switchboard equipment by keeping on hand a suitable outfit of jumpers with proper terminals soldered on to use for emergency connections to temporarily transfer feeder or generator leads from one switch to another.

GENERATING PLANT TRANSFORMERS.

Many of the considerations involved in the generating units enter into the question of duplication for reserve in a transformer equipment. Here also in regard to the size of unit selected a proper balance must be established between the saving in cost per kilowatt by the adoption of large units and the saving in investment in reserve transformers by the installation of smaller ones. Another important question has recently been brought up in connection with transformer plants by the introduction of one polyphase transformer as a substitute for two or three single-phase transformers for a bank. A polyphase transformer occupies less space and costs less than a bank of single-phase transformers, but when reserve is considered it is not so good. If a bank of separate single-phase transformers breaks down the trouble is not likely to involve more than one of the component transformers and this can be replaced by a small kilowatt reserve. If, however, a polyphase transformer breaks down, capacity equal to its full polyphase rating is put out of service.

In the writer's opinion all important transformer stations should have a complete spare bank which can be shut down at any time without overloading the remaining-transformers, and in addition one single-phase transformer should be held in stock to make good any bank in case one of the component transformers should break down.

OVERHEAD DISTRIBUTION.

If there is a single element in an electrical system where trouble is sure to develop sooner or later it is on the overhead lines, and the higher the pressure the more likely is the trouble to occur. This is so because the overhead lines are subjected to influences over which the power company has no control. These influences are principally lightning, general abnormal weather conditions, malicious interference, and accidental interference caused by the contact of other companies' wires during construction work. For these reasons it is practically out of the question to attempt to maintain a continuous power service over a single-circuit overhead line. There should always be enough circuits installed so that at least one can always be shut down without necessitating a reduction in load. This is especially true in the case of high-pressure lines. In low-pressure systems of 2,300 volts or less it is nearly always possible to replace insulators and do other work on the line while it is "alive," but at higher pressures this should not be allowed if there is any regard for human life. In many plants where important interests are dependent upon the power transmitted the matter of duplication should be carried beyond the circuits and reserve pole-lines installed. Carried to its limit without regard to cost, the ideal condition would be a number of single circuits each installed on a single pole-line and each line following a different route. With this arrangement lightning would not be likely to disturb more than one line at a given time, and a complete shut-down from malicious interference involving all the lines, would be very improbable. The cost, however, in such a separation of lines would in most cases be prohibitive on account of purchase of right of way, patrolling, etc.

UNDERGROUND DISTRIBUTION.

When trouble develops on an overhead line the location of the breakdown can usually be quickly found by patrol and repairs made without delay. In an ungerground feeder, however, the conditions are radically different. Breakdowns are difficult to locate and when found repairs frequently occupy many hours on account of the necessity for pulling out the defective cable from the ducts, putting in new cable and resplicing. Duplicate or triplicate cables should always be installed where important service is involved. This obligation is conceded by most engineers, and spare underground cables are usually installed. The installation, however, is apt to be carried out in such a way that the security of the reserve cables is impaired. Underground conduits as now generally constructed consist of a congested mass of ducts grouped in such a way that in the manholes the cables are crowded closely together and all in constant danger of destruction in case of a violent short circuit in the manhole. There is little value in installing spare cables when they are liable to be damaged at just the time when they are most urgently required. Such risk can only be obviated by constructing electrical conduits in such a way that the cables can be separated in the manholes by short-circuit proof barriers. Preferably, whenever possible, duplicate conduits should be constructed on opposite sides of the street or, still better, laid through different streets. Only by such precautions can the full benefit of the reserve cables be insured.

SUB-STATION APPARATUS.

The general considerations which apply to generating-plant reserves also apply to outlying sub-stations but in a less degree, for the complete shut-down of a sub-station involves only a portion of the power system. Farther out on the power network to the plants of individual customers, where the transformer or other apparatus is supplied by the power company, no reserve seems necessary under the ordinary obligations of such cases. If a breakdown occurs only the individual is inconvenienced, and therefore the risk is usually justified.

AMERICAN INSTITUTE'S MEETING.

It is expected that there will be a large attendance at the meeting of the American Institute of Electrical Engineers to be held at Asheville, N. C., June 19–23.

Arrangements have been made with the Southeastern Passenger Association, in whose territory Asheville is located, for a one and one-third round trip fare on the certificate plan. It is probable that the Southern Railway Company will allow the members of the Institute a one-fair rate over its lines.

The convention headquarters will be at the Battery Park Hotel, Asheville, where there is a suitable hall for the reading of papers. The hotel accommodations are excellent. The rates at this hotel will be from $3.50 to $4.50 per day, on the American plan. Cheaper accommodations may be had at other hotels.

A $350,000,000 "Sleeper."

The identity of the persons connected with the Anti-Monopoly Light & Power Company of New York was made public Friday, when the incorporation papers were filed. The company was incorporated Wednesday at Albany, and immediately after a mortgage was executed covering all right and title in a half interest in its franchise for $350,000,000. The company is capitalized at $100,000, and its franchise has lain dormant for 18 years.

Albert G. Stephenson, vice-president of the "anti-monopoly" company, said to a reporter that the reason for getting the mortgage of $350,000,000, was that the company wanted to have money in store to enlarge the business at any time that it became necessary. A man in this company, he said, has been mixed up in the lighting of nearly half the cities of the United States.

ELECTRICAL PATENT RECORD.

LETTERS PATENT ISSUED MAY 23, 1905.

Electric Railways and Appliances.

790,434. Trolley. John B. Humphrey, Louisville, Ky., assignor of one-half to Sam B. Crowder, same place. Filed Sept. 21, 1904.

790,538. Protected-Third-Rail Electric-Railway System. Henry A Thomsen, New York City. Filed Feb. 12, 1904.

790,670. Steam or Electric Railway Cross-tie Made of Concrete. Augustus W. Wolfe, Gladstone, Mich. Filed Nov. 16, 1903.

Electric Lights and Appliances.

790,472. System of Distribution for Multiple-Glower Lamps. Alexander J. Wurts, Pittsburg, Pa., assignor to George Westinghouse. Filed Nov 9, 1900.

790,499. Electric Lamp. Marshall W. Hanks, Pittsburg, Pa., assignor to George Westinghouse. Filed July 14, 1900.

790,525. Electric Glower-Lamp. Henry N. Potter, Gottingen, Germany, assignor to George Westinghouse, Pittsburg, Pa. Filed Aug. 14, 1899.

790,551. Electric Lamp. Edward Bennett, Pittsburg, Pa., assignor to George Westinghouse. Filed Sept. 26, 1903.

Electrical Machinery and Apparatus.

790,362. Variable-Speed Power-Transmission Mechanism. Max Guttner, Chemnitz, Germany. Filed July 8, 1904.

790,368. Alternating-Current Machine. Charles W. Johnson, Norwood, O., assignor, by mesne assignments, to the Bullock Electric Company. Filed Oct. 30, 1903.

790,414. Alternating-Current Commutator Machine. Gabriel Winter, Vienna, Austria-Hungary, and Friedrich Eichberg, Berlin, Germany, assignors to the General Electric Company. Filed Aug. 24, 1903.

790,424. Transmitting and Reversing Gear for Motors. William Bruns, New York City. Filed Sept. 24, 1904.

790,471. Dynamo-Electric Machine. Edwin C. Wright, Newport, Ky., assignor to the Bullock Electric Manufacturing Company. Filed Sept. 30, 1904.

790,475. Dynamo-Electric Machine. Bernard A. Behrend, Norwood, O., assignor to the Bullock Electric Manufacturing Company. Filed Sept. 19, 1904.

790,541. Controller for Electric Motors. Walter J. Warder, Jr., Chicago, Ill., assignor to the Western Electric Company. Filed Sept. 26, 1904.

790,569. Electric Machine. Albert F. Hemingway, Chicago, Ill., assignor of one-half to John R. Markle, same place. Filed Aug. 15, 1904.

790,768. Electric Stop-Motion for Textile Machinery. Joseph B. Whitney, Brooklyn, N. Y. Filed Aug. 9 1902.

Telephones and Telephone Apparatus.

790,428. Telephone-Trunsmitter. Harry M. Gall, Buffalo, N. Y. Filed July 7, 1904.

790,548. Annunciator. George F. Atwood, New York City, assignor to the Western Electric Company Chicago, Ill. Filed June 18, 1904.

790,550. Party-Line Telephone. Henry M. Bascom, Brooklyn, N. Y., assignor to John F. Hemenway, New York City. Filed Sept. 12, 1904.

790,684. Telephone Call Attachment. Joseph Harveston and John O. Mudgett, Santa Cruz, Cal. Filed Dec. 16, 1904.

790,740. Desk Attachment for Portable Telephones. Edmund Ocumpaugh, Rochester, N. Y., assignor to the Defiance Machine Company, same place. Filed Dec. 26, 1903.

790,812. Electric Telephone-Switch. George F. Archer, New York City. Filed Oct. 15, 1903.

790,814. Multiple Switch for Telephones. Charles V. Beaver, Anita, Ia. Filed Dec. 7, 1901.

790,854. Telephone System. John G. Roberts, Evanston Ill., assignor to the Kellogg Switchboard & Supply Company, Chicago, Ill. Continuation of renewed application filed Feb. 23, 1901. This application filed May 8, 1902.

Miscellaneous.

790,303. Burglar-Alarm. John E. Liess, Chicago, Ill. Filed Nov. 13, 1903.

790,309. Electrical Veterinary Appliance. Albert Paxton, Montpelier, Ind. Filed Sept. 15, 1904.

790,502. Battery Solution. Frank M. Holmes, Marionville, Mo., assignor to Richard H. Stevens, trustee, Clayton, Mo. Filed Jan. 25, 1904.

790,581. Inductance and Induction Coil for Electrical Apparatus. Dimmitt R. Lovejoy, Niagara Falls, N. Y., assignor to the Atmospheric Products Company, same place. Filed Aug. 19, 1903.

790,747. Electroplating Apparatus. Charles T. Pratt, Frankfort, N. Y., assignor to the Pratt Chuck Company, same place. Filed Oct. 3, 1903.

790,753. Electric Clock System. William A. Roberts and Edward T. Robinson, St. Louis, Mo., assignors of one-third to Edward I. Robinson, same place. Filed March 19, 1904.

790,819. Means for Controlling Electric Currents. Gerald J. Dorman, Brooklyn, N. Y., assignor to the Consolidated Railway Electric Lighting & Equipment Company. Filed Oct. 16, 1902.

790,866. Battery. William C. Banks, New York City. Original application filed April 11, 1901. Divided and this application filed Jan. 5, 1905.

790,870. Thermostat. Harvey H. Blackman, Ithaca, N. Y., assignor to the Cornell Incubator Manufacturing Company, same place. Filed June 10, 1904.

THE TELEPHONE WORLD.

Telephone Company Declares Dividends.

At a monthly meeting of the directors of the Columbus, O., Citizens' Telephone Company, the regular quarterly dividend of 1 per cent. on the common stock of $750,000 was declared.

According to the reports received the company is in a flourishing condition and everything is practically in readiness for the installation of the automatic plant, which will take place during June.

Advices have been received by the Columbus people to the effect that vast improvements are to be made by the United States Telephone Company, which controls its long-distance lines, and that by January 1, 1906, the equipment of this company will be unexcelled. The long-distance people expect to have direct communication with the Independent companies of 80 counties in Ohio by October 1 of this year.

The big fight at present is for an entrance into Hamilton County and the Independent people claim that they will be in Cincinnati shortly.

The Independent & Interstate Telephone Company is slowly but surely establishing its system in Peoria, Ill. Two weeks ago 300 telephones were "cut in" for use, and every day since that time 50 to 70 instruments have been reported "in order." The work is proceeding as rapidly as is possible under all circumstances.

Attorney W. A. Medsker, of Cambridge City, Ind., representing the Milton Co-operative Telephone Company, has procured the charter under which it will be fully organized for business. The capital stock of the company is now $10,000.

The Albion-Loretto, Neb., Telephone Company, an Independent concern, has been organized and has filed articles of incorporation with the Secretary of State. The capital stock is given at $5,000. W. F. Riley and F. F. Willott head the long list of incorporators and stockholders.

The Sandusky, O., Telephone Company has inaugurated a telephone system at a rate of one cent per call. A great many slot machines have been in use in that city, and contracts are now being signed by almost every one who has in any way any use for the system.

A material reduction in rates will be made by the Providence, R. I., Telephone Company in that city on June 1. The rates for the entire system, including Attleboro, Woonsocket, Pawtucket, East Greenwich, Warren Bristol and North Attleboro, have not been revised.

A local telephone line has been organized at Junction, N. J., with the following officers: President, Dr. T. B. Fulper: secretary and treasurer, Peter S. Shurts.

A new telephone company has been formed to build a line in Browerville, Minn., and the rural districts. Charles Emerson is secretary.

The Exline Mutual Telephone Company has lately been incorporated in Exline, Ia.

Plans are under way for the installation of a telephone system in Hammonton, N. J.

Telephone Rivalry in Nebraska.

The two telephones in Beatrice, the Nebraska, or Bell, and the Home, are vying with each other to see which can make the most extensions and give the best service. The result is that nearly every neighborhood in the county is reached by 'phone, and it is the intention of the Home company to include within its organization many of the small farmer companies. This will enable the Independent outside companies to get into Beatrice and to the court house, and it will also give the city exchange a wider range in the country.

Telephone Tyranny.

There is strong talk of the organization of a home telephone company in Dickson County, Tenn. The Cumberland Company, which is now operating in that field, charges prohibitive rates and refuses to build lines in the county unless the people provide the material and help construct them, and then pay two prices as 'phone rent. This has incited the farmers to action, and if the Cumberland Company does not show a more liberal spirit toward the rural districts of the county, doubtless a new company will be in the field within the next few months.

The Adirondack Home Telephone Company, which is to be controlled by Albanians, was incorporated lately, with a capital of $150,000 to operate in Franklin, Clinton, St. Lawrence, Jefferson, Lewis and Essex Counties, N. Y. The principal office is to be located in Malone. The directors are Howard Hendrickson, Henry M. Keys, Frank E. Griffin, William B. Harris, Herman J. Dickman and Cornelius J. Crummey, of Albany. It will connect the various cities and villages in the counties mentioned.

The subject of the municipal ownership of the telephone service in Gouverneur, N. Y., is being looked into by a committee of citizens, and the village board has adopted a resolution to the effect that no new franchise for a telephone service in that place be granted until the question of municipal ownership is thoroughly discussed.

The Connecticut Telephone & Electric Company, of Meriden, lately shipped to the Island of Guam 100 telephones and the necessary switchboard equipment, for the United States Government to be used in connecting the various forts and the interior army posts.

The West Kentucky & Tennessee Independent Telephone Association will meet in Mayfield, Ky., June 3.

The People's Telephone Company has completed a pole line from Washingtonville to Strawberry Ridge, Pa.

The work of putting in the new telephone poles between Fond du Lac and Plymouth, Wis., is now completed.

The Edinburg, Ind., Telephone Company has declared a 6 per cent dividend.

The Bluefield, W. Va., Telephone Company has increased its capital stock from $30,000 to $50,000.

Extension of Independent Lines.

Max Hosea, of Columbus, Ind., has been in Jennings County to look after the Independent telephone interests. Mr. Hosea has the management of the North Vernon & Vernon Telephone Companies and the Jennings County Telephone Company. These lines are being extended to all parts of Jennings County, and also lapping over the border of Scott, Jackson, Jefferson, Ripley and Decatur Counties. There are now 700 'phones in operation in these systems in Jennings County, and when the extensions now being built are completed, there will be added to the service over 700 more, making a total of about 1,500 in use in Jennings County and contiguous territory.

Sherman is soon to be made the central exchange for a great telephone system, covering several North Texas counties and giving service to farmers all over the country. The projected lines are being arranged for, and work has already begun on several. It is proposed to give free connection to subscribers at a great number of the exchanges. For instance, Sherman subscribers will be given free communication with Howe, Van Alstyne, McKinney and a number of other small towns, and also with farmers along these lines.

The stockholders of the Mutual Telephone Company, of Shelbyville, Ind., at their monthly meeting instructed their board of directors to let the contracts for an entirely new plant to be constructed in that city. The plant will include an underground system. The 1,120 lines to be laid will have a capacity of 4,800 telephones. A large lot will be purchased and a building erected for the plant, which will include a power plant. The probable cost of the improvements will be $65,000, and the work will be completed by February 1, 1906.

The work of erecting the telephone exchange building for the private automatic system of the New Orleans, La., Naval Station, is progressing well, and the system will be ready for use some time in June, or within the time provided in the contract. The automatic telephone instruments and the selectors have been shipped from the Chicago factory of the Automatic Electric Company, and the installation of them will be commenced about the 1st of June. There will be 25 telephones in the service.

The Freeborn County Rural Telephone Company, of Glenville, Minn., has filed articles of incorporation with the Secretary of State. The capital stock is $10,000, and the incorporators are A. W. Trow, Martin Moe, S. P. Nelson, A. S. Budlong, N. P. Nelson, W. S. Palmer, Walter Knutson and Fred Will.

C. E. Webster, manager of the Independent Telephone Company, of Seattle, Wash., has finished preliminary details on a long distance telephone circuit that is to embrace all the principal points in the Pacific Northwest.

The Eagle Lake, Me., Telephone Company is busy locating a line from Fort Kent, passing through Eagle Lake to Portage Lake.

A local telephone exchange is being put in Torah, Minn.

GENERAL ELECTRICAL NEWS.

LIGHTING.

Aberdeen, S. D.—Sufficient funds have been raised by local business men to insure the installation of a new electric lighting plant. The plant will be built and put in running order by private subscription, and then sold to the city. It will cost at least $40,000.

Anderson, Ind.—Several farmers near here have made a proposition to the city council to have their homes and premises connected with the municipal electric light plant in this city.

Ashburnham, Mass.—The Greene Electric Light & Power Company, incorporated with a capital of $12,000, has the following officers: Charles H. Greene, president; Alonzo A. Carr, treasurer.

Cold Spring, Minn.—The proposition of an electric light and waterworks system for this village has been discussed by the council, and it was decided to submit at an election the proposition of voting $6,000 bonds for the purpose above mentioned.

Deadwood, S. D.—The consolidation of the Lead and Deadwood Electric Light Companies has finally been effected.

Dillon, Mont.—Dr. M. A. Miller, principal stockholder of the Dillon Electric Light & Power Company, has sold his stock to H. W. Turner, manager of the Butte Electric Company.

Fort Valley, Ga.—Bonds for electric lights were recently sold here.

Green Bay, Wis.—The sum of $200,000 will be expended in this city on gas and electric light improvements this year. The stockholders of the old light company voted to dissolve and sell all property to the Green Bay Gas & Electric Company. The officers are William Mainland, of Oshkosh, president; H. Fisk, of this city, secretary.

Groesbeck, Tex.—The Anglin Light Company of this place has been incorporated to supply electric light to the public. Its capital stock is $6,000, and the incorporators are E. Anglin, John Clairman and others.

Hartsville, Ind.—This city is soon to have an electric lighting plant.

Kenton, O.—Kerlin Brothers, of Toledo, have purchased the plant of the Kenton Gas & Electric Company for $128,000. About $50,000 will be spent by them to make the plant one of the best in the State. The city council will give the Kerlins a five-year lighting contract.

Marianna, Fla.—This town contemplates erecting an electric light plant.

Melrose, Minn.—The citizens have voted to issue $26,400 bonds to aid in the introduction of an electric light plant and the extension of the waterworks system.

Memphis, Tenn.—The mayor has appointed a committee from the Legislature council to carry out the provisions of the general assembly, authorizing $1,000,000 bonds to build a municipal electric light plant.

Parsons, Tenn.—A few men of this place met recently and decided to put in an electric light system. The principal stockholders are L. A. Rains, J. W. Fuller, Houston Partin, C. F. Abston and the Parsons Marble & Granite Works.

Potsdam, N. Y.—The trustees of this village have decided to offer for sale bonds to the amount of $40,000, the proceeds to be used to construct, equip and maintain a plant to furnish the village and its people with electricity, according to the terms proposed at a recent election.

Princeton, Ill.—It is reported that J. D. Dennis will install an electric light plant in his building here.

Rathdrum, Idaho.—Arrangements have been completed by which an electric light company will be organized to install a system here, the plant to be in operation within 90 days.

Savannah, Ga.—The Savannah Electric Company will double its lighting capacity by installing a steam turbine valued at $18,500.

Sioux City, Ia.—The Sioux City Gas & Electric Light Company will expend $100,000 for improvements.

South St. Paul, Minn.—The city council has granted a franchise to the South St. Paul Heat, Light & Power Company for the purpose of constructing an electric light system and power to manufacture plants.

Stoughton, Wis.—At a recent meeting of the city council, it was decided to purchase the electric light plant from the Electric Light & Power Company at $12,000.

Sturgeon, Mo.—This town has let the contract for an electric light plant.

Syracuse, N. Y.—The Hoosick Falls Electric Light & Transmission Company is to do business in Onondaga and other counties. Its capital stock is $150,000.

Tecumseh, Neb.—The Tecumseh electric light committee has prepared a report to submit to the next meeting of the city council, which it is said asks for improved equipment at the power house.

Ventura, Cal.—This city has voted to issue bonds in the sum of $100,000 for waterworks, and $25,00 for an electric light plant.

White Plains, N. Y.—The Homans Light, Heat & Power Company, of this place, has been formed to supply gas, electricity and steam throughout the State. Its capital stock is $50,000, and directors, R. B. Marten, W. P. Homans and M. S. Watts, of New York City.

STREET RAILWAYS.

Asbury Park, N. J.—From reliable sources it was lately stated here that the Central Railroad of New Jersey and the Pennsylvania, operating the New York & Long Branch Railroad, in a short time will substitute electric engines as a motive power on the road.

Chattanooga, Tenn.—The Chattanooga Electric & Rapid Transit Street Railway Company will make extensive improvements this summer.

Chickasha, I. T.—The city council has granted a franchise to the Chickasha Transit Company to build and operate an electric street railway system.

Chouteau, Mont.—An electric franchise has been granted to Dr. E. Crutcher to construct electric lines over the roads of Teton County.

Council Bluffs, Ia.—Capitalists of this city are behind the scheme to build an electric road to Oakland or Carsons, running past Treynor and extending to Des Moines.

Evansville, Ind.—According to the statement of H. W. Richardson, secretary of the Evansville & Henderson Traction Company, the new road will be in operation by September 1.

Kansas City, Mo.—An electric line from this city to St. Joseph on the Missouri side of the river, with spurs across to Leavenworth, is under consideration by a party of Cleveland capitalists.

Marcellus, N. Y.—The Marcellus & Otisco Lake Railway Company is a reorganization of the Marcellus Electric Raiload Company. Its capital stock is $200,000, and directors, G. M. Brill, Merion, Pa.; S. S. Marvin, Bryn Mawr, Pa.; H. H. Bayne, New Brighton, S. I.

Oakfield, N. Y.—The village board has signed a contract with the United States Gypsum Company for lighting the streets of this place with electricity.

Rochester, N. Y.—Offices have been established in this city by the Rochester & Southern Electric Company which has been formed for the purpose of building an electric railway between this city and Elmira, with several branch lines. George A. Engert of New York, is in charge of the company's affairs here.

Toronto, Ont.—The Ontario Government is asking for power to extend the Temiskaming to the Grand Pacific, and to operate the road by electricity.

Webster, Mass.—The territory between this town and Southbridge, it is said, will soon be looked over by an engineer with the view to forming a corporation to construct an electric railway to directly connect the two towns.

POWER PLANTS.

Buffalo. N. Y.—The Niagara Gorge Power Company, of this city, has been capitalized at $2,000,000. J. T. Jones, J. A. Jones, R. E. Powers and H. P. Bissell, are the directors.

Chattanooga, Tenn.—The proposition of C. E. James and J. C. Guild to erect an electric power plant on the Tennessee River, at a cost of $3,000,000, has received the cordial and hearty support of this city.

Langford, Pa.—The Lehigh Coal & Navigation Company in Panther Creek Valley contemplates erecting a large electrical plant here.

Reno, Cal.—A new electric power plant will be constructed in this city at a cost of $50,000.

Sault Ste Marie, Mich.—The Edison Soo Electrical Company has executed a mortgage for $500,000 to secure the bond issue, the proceeds from which will be used in extending the power plant of the concern.

Winnipeg, Man.—The organization of a strong company that has been formed to develop electric energy from Winnipeg River water power is about completed, and it is expected that actual work will be under way early in June.

Youngstown, O.—Plans are to be made to greatly enlarge the power plant of the Youngstown Consolidated Gas & Electric Company on North avenue.

BIDS WANTED.

Meaford, Ont.—Bids will be received until 2 P.M. June 5, for electrically lighting the streets of this town. K. G. Clarke may be addressed.

Wilmington, N. C.—Sealed bids will be received until June 8 for suppling this city, for the year ending May 31, 1906, with electricity for lighting, etc. Address A. M. Waddell mayor

NOTES FOR INVESTORS.

Latest quotations for copper are: Electrolytic, 15@15⅛c.; Lake 15@15⅛c.; casting, 14¾@14⅞c.

The Bryant Electric Company of Bridgeport, Conn., has filed notice of increase of its capital stock from $125,000 to $2,500,000.

The control of the Springfield (Mass.) Street Railway Company was formally passed into the New Haven Railroad management Friday afternoon.

The Lockport Gas & Electric Light Company of Lockport, N. Y., has filed with the Secretary of State a certificate of increase of capital from $150,000 to $300,000.

The Holland Electric Power Company of New York was incorporated at Albany on Saturday with a capital of $20,000. The directors are G. G. Cooper, R. U. Conger and Goodwin Fitch, of New York.

The American Railways Company, Philadelphia, has reported for the first ten months of the fiscal year gross earnings of $1,205,994, an increase of $53,602, or 4.5 per cent., over those for the same period last year.

Many brokers in the financial district are asking for an annual report of the Westinghouse Electric Company and proclaiming that while the General Electric publishes full annual statements, the Westinghouse people are keeping silent.

An action was begun Friday in the United States Circuit Court by the Westinghouse Electric & Manufacturing Company against the Manhattan Railway Company of New York to recover $371,475, claimed as due the plaintiff on contracts with the defendant.

The April report of the Montreal Street Railway Company, just published, shows a comfortable gain in net earnings over last year. The surplus account is increased by about $15,000. The expense account for the month amounts to practically the same as in the same month last year.

The Hydrotherm Electrical Company was incorporated Friday in New Jersey with a capital of $1,000,000. The incorporators are L. D. Winton, E. M. Treat, Charles F. Bates, Robert E. Williams, S. M. Heil, Edward Sills, C. T. Westlake and T. T. Price, all of Jersey City, The company is to manufacture and deal in electrical machinery.

Steam roads out of Columbus, O., have taken concerted action to compete with the electric roads out of that city. All but the Pennsylvania Company have agreed to meet the rates of the interurban to competing points. The Pennsylvania officials decided that it would not be profitable to fight the interurbans.

In Metropolitan circles in New York there is some tendency to concede that the Supreme Court of the United States will sustain the constitutionality of the franchise tax law, but though the principle of the measure will then be settled beyond dispute, there is the large question of offsets, the amount and nature of which will be the cause of additional litigation.

N. W. Halsey & Co. of New York are offering $2,500,000 first mortgage 5 per cent. gold bonds of the West Penn Railways Company. The property upon which these bonds are a lease consists of 98 miles of interurban electric lines of heavy steam railway construction, serving a population of over 200,000 in the well-known Connellsville coal and coke district adjacent to Pittsburg. They are also a lien upon an electric lighting system which supplies 34 communities, including five cities.

You often have jobs where it is necessary or desirable that your service switch and cutout should be protected from dampness, corrosive fumes, or mechanical injury. This is accomplished most easily and inexpensively with a Trumbull Iron Service Box. Everything considered the box will be found cheaper to use than a wooden box lined with sheet iron, and being made of iron it is damp proof, dust proof, fire proof and indestructible, which the wooden box is not. The box is furnished with bushings, or drilled for iron pipe of any size, as desired. Made in five sizes for service from 15 to 300 amperes. The switch is constructed to open back over the fuses, allowing the door to be closed when the switch is open. Altogether, it is the most satisfactory service box made, and can be used safely anywhere. Send for booklet "C" which gives more complete information, and quotes prices. Yours for a postal.

EDITORIAL NOTES.

The National Electric Light Convention. The twenty-eighth convention of the National Electric Light Association is now in full swing at Denver. The programme this year is a most elaborate one and if successfully carried out should make this year's convention by far the most instructive and incidentally entertaining of any held heretofore.

Nothing escapes criticism in this world and the locality selected for the holding of this year's convention is no exception to the rule. Many Eastern members of the association thought it too far West, but on the other hand, the far Western members are entitled to some consideration and the locality selected should enable them to attend without having to travel across the whole Continent as they have several times been obliged to do.

The numerous papers which will be read at this gathering are invariably on subjects of vital interest to the industry, as may be gathered by a glance at the programme, which will be found on page 315 of this issue. The volume on wrinkles—for in reality it is a volume—edited by Mr. H. C. Abell, is a feature of quite recent origin which cannot be too highly commended. There are invariably hints in these short descriptions and explanations which are simply not attainable in any other way.

The many reports to be made this year we are confident will prove of great interest to all engaged in the electric light business.

The social and entertainment features of this convention are decidedly attractive, the trip to Colorado Springs affording the delegates an opportunity of visiting Pike's Peak and other points of interest in the immediate neighborhood.

The Ruling Power in Battle. Warfare has passed through many stages of transition, and in its development to what we, with unconscious satire, call civilized warfare, it has budded into a new growth. It has emulated the examples shown by nature in her methods of protectiveness. The creature with a shell on its back, or even the mollusk, living entirely within its shell, is a type of our own martial progressiveness. When we say our own, it is to be understood that the expression embraces all history. Man originally settled his arguments with his bare hands and teeth or with a club. He graduated from this to a weapon with a cutting edge. He then protected himself with a carapace, like the turtle. This was his shield and saved his body from missiles and blows.

The bow and arrow and the large war canoe or wooden vessel is found in early England, France, Germany and Greece. Other countries probably advanced along the same lines, including the Oriental nations. Darius, the Persian king, with a million men at his back marched against the Greeks. The bows and arrows of his followers fell harmlessly against the great shields of these ancient warriors. Authentic records show how Darius and his myriads were destroyed by less than a hundred thousand men.

Thus history repeats itself. Warfare no longer consists of numbers. Its successes cannot be measured by officers. The fundamental force engaged in action in great naval batteries is intelligence, not that the word can be used carelessly. It is to be applied specifically. Trained or specialized intelligence is the phrase. This, in conjunction with the operation of vast steel shells and devices to project explosives and masses of metal through the air, constitutes the ruling power in battle. But, although the steel becomes harder and thicker and the projectiles and explosives more terrible in their destructiveness; their effectiveness is governed by other influences of which we must speak. This influence is not hard to imagine as it is found operating on every side in civilized centers.

Protection at night is found in the powerful electric eye of the warship which sweeps the horizon. The signal for advance or recession is flashed through the invisible ether by Hertzian waves. The great guns are raised, lowered and set off by electrical energy, and finally the ship's light is operated by the same means. The scorpion of the seas, the torpedo boat, is inmeshed by the same influence, and the submarine, when pursuing its deadly vocation under the ocean, is driven and controlled by the force of electricity. Thus it is evident that a nervous system operates any great galaxy of battleships. A nervous system through which electricity sends its marvelous manifestations. The hand that touches the buttons must be animated by the fire of genius, but its thought to-day is best crystallized by the web electricity has spun.

* * *

The Giant Generator.

Twenty years or so ago the products of electrical enterprise were very crude and limited. It can be well remembered by some how a plumbing system was attached to the early jumbo dynamos. This was the only effective way of keeping them cool. They were then, as a witty expert explains, "not dynamos, but machines for producing electricity." Scientific knowledge was so rare that even the mechanical crystallization of the things best known stood on the ragged edge of failure. Arc lamps, incandescent lamps, dynamos and motors were purely experimental in character. Sparking at the brushes was considered a healthy sign, and the continuous though uneven light of an arc lamp a distinct victory. Retrospection shows how much things have changed since then. It points out the advance in the fields that mark the most intense displays of progress and energy. It shows how the incandescent lamp has reached a high state of perfection, the arc lamp a degree of regulation that leaves no criticism, the motor an efficiency that has established it in the majority of commercial and industrial projects for all time, and the dynamo a position in the nation's development that makes its utilization indispensable.

The last is but a sign of what is to come. Larger and larger each year the generator has grown, until now its size is becoming that of a behemoth. The giant generator is the term applied, not because it has reached its final stage of growth, but through the enormous dimensions of itself and the great functions it performs. The kilowatts capacity are being increased at so rapid a rate that little doubt now remains of what the future will yield.

The electric light and power station of a decade hence will be equipped with the most modern of appliances. Not the least of these will be generators of a capacity that will overshadow those now in use.

Valid objections to great size in this case cannot exist. Great generators offer every advantage in the consideration of large power enterprises. For this reason the shops have tasks before them that will alter the architectural and electrical conceptions of our engineers as few things in this last period of our progress.

UNDER THE SEARCHLIGHT.

Notes and Comments on Various Topics.

The annual meeting of the National Electrical Trades' Association will be held on June 23 at La Corona Hotel, Montreal.

In the minds of some close observers there is still considerable doubt about the ability of the Mayor of Chicago to raise the funds to carry out the necessary terms and conditions for the purchase of the traction properties of that city.

It is authoritatively stated that contracts for fully $5,000,000 of electrical equipment machine and tools have recently been placed in the New York market for Japanese account, shipment to be made with all dispatch.

Owing to the increase in the use of electrical power the London firemen are provided with india-rubber gloves.

The Connecticut Senate has repealed the general railroad law to make it necessary hereafter for steam and trolley companies to secure charters through legislation.

Mr. William Marconi, the wireless telegraph inventor, and Mr. George G. Ward of the Commercial Cable Company sailed for Liverpool on the Campania Saturday afternoon. Mr. Marconi said that he was going to make an effort on the voyage to beat the record made by the wireless operators on the Campania's recent voyage, when for three days in mid-ocean the big ship was in wireless communication with both sides of the Atlantic at the same time. Mr. Marconi hopes to maintain communication with both America and England every day of the voyage.

Conventions attract great crowds in this country. They are local congresses in which politics take a back seat and practice the front. Comparing notes is a great American institution. We owe a large measure of our success in the development of the lighting industry to conventions. The knowledge gleaned in this manner is invaluable. The N. E. L. A. has been one of the most potent influences in this respect. The progress of the fiscal year is in the convention's hands, and all await its conclusions with interest.

An engineering congress will be held at the Lewis and Clark Centennial Exposition, at Portland, Ore., on June 29, 30 and July 1, to which all engineers, architects and other technical men are especially invited.

The length of electric railways in Canada on June 30 last was 767 miles, of which 376 miles were in the province of Ontario, and 254 miles in Quebec.

Trustees of the Massachusetts Institute of Technology are said to have taken options on 3,000,000 feet of land in Watertown, near the Government arsenal, as a possible site for some of its mechanical buildings.

An attempt is to be made to utilize as ore the magnetic sands found on the north shore of the Gulf of St. Lawrence. It is stated that no difficulty is found in getting rid of the titanium and concentrating the sands till they assay 70 per cent. metallic iron; but before they can be utilized some satisfactory process of briquetting them is necessary. Experiments are therefore in progress to this end.

Victorious Japan with her well-earned Banzais takes her successes coolly. Commodore Perry was forced to exercise great tact to enter the Mikado's dominions. To-day the Japanese children celebrate this event in what would be called Perry's Day. Every move of the Russian fleet before they came into vision was sent to Togo by "wireless." Would Marconi's Day be any less appropriate if celebrated as a tribute to one whose genius added so much to their national preservation.

THE NATIONAL ELECTRIC LIGHT CONVENTION.

A larger delegation than was expected left New York on Saturday morning on the special train to attend the convention of the National Electric Light Association at Denver.

Following is the complete programme for the convention:

PROGRAMME.

TUESDAY, JUNE 6—FIRST SESSION, 10 A.M.

Convention Hall, Brown Palace Hotel.

Address of Welcome, the Mayor of Denver.

President's Address, Ernest H. Davis, Williamsport, Pa.

Report, Progress, T. Commerford Martin, New York.

The Paramount Importance of Choosing Standard in Preference to Special Machinery, David Hall, Cincinnati, O.

ERNEST H. DAVIS,
President National Electric Light Association.

Insulation Testing—Apparatus and Methods, C. E. Skinner, Pittsburg, Pa.

TUESDAY, JUNE 6—AFTERNOON SESSION.

Automatic Synchronizing of Generators and Rotaries for Lighting and Power Systems, Paul MacGahan, Pittsburg, Pa.

Notes on Rotary Converters and Motor Generators for Lighting and Power Systems, Louis E. Bogen, Cincinnati, O.

The Organization of Working Forces in Large Power Houses, W. P. Hancock, Boston, Mass.

Report of Committee on Steam Turbines, W. C. L. Eglin, Chairman, Philadelphia, Pa.

Operating Features of the Curtis Steam Turbine, A. H. Kruesi, Schenectady, N. Y.

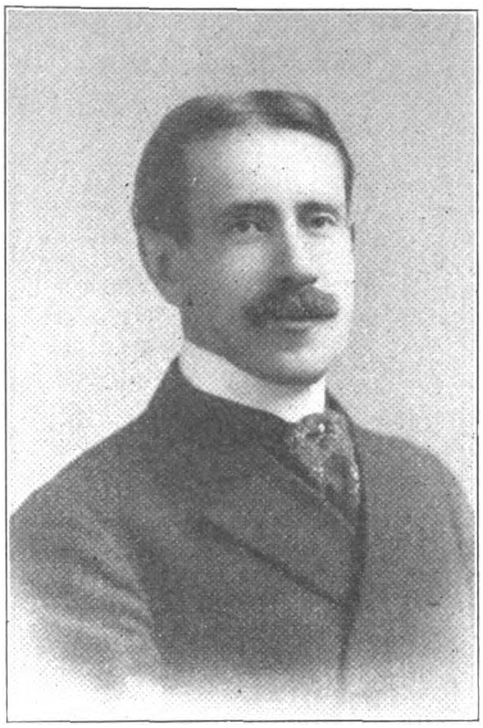
WEDNESDAY, JUNE 7—MORNING SESSION.

Series Alternating Current Motors for Industrial Work, Clarence Renshaw, Pittsburg.

A New Type of Single-Phase Motors for Elevator Work, S. Percy Cole, St. Louis, Mo.

Long Distance High-Tension Transmission in California, John A. Britton, San Francisco.

Report, Present Methods of Protection from Lightning and other Static Disturbances, Alex Dow, Detroit, Mich.



DUDLEY FARRAND,
Secretary and Treasurer of the National Electric Light Association.

The Nernst Lamp—Its Present Performance and Commercial Status, E. R. Roberts, Pittsburg.

The Choice of an Insulated Cable, Wallace S. Clark, Schenectady, N. Y.

WEDNESDAY, JUNE 7—AFTERNOON SESSION.

Some Investigations of Induction Losses, E. P. Dillon, Colorado Springs, Col.

Mercury Arc Rectifiers, P. D. Wagoner, Schenectady, N. Y.

Report, Advertising Methods, Percy Ingalls, Newark, N. J.

Report, Sign and Decorative Lighting, Le Rue Vredenburgh, Boston, Mass.

Free Signs and Flat Rates, C. W. Lee Newark, N. J.

THURSDAY, JUNE 8—MORNING SESSION.

Report, Progress of Electric Heating, James I. Ayer, Boston, Mass.

Report, Purchased Electric Power in Factories, E. W. Lloyd, Chicago.

Report, Committee on District Steam Heating, W. H. Blood, Jr., Chairman, Seattle, Wash.

Wrinkles, H. C. Abell, Editor, New York City.

THURSDAY, JUNE 8—AFTERNOON SESSION.

Report, Committee on Relations with Kindred Organizations, James I. Ayer, Chairman, Boston.

Executive Session.

Report, Committee on Rates and Costs, Charles L. Edgar, Chairman, Boston.

Report, Municipal Ownership, Arthur Williams, New York City.

Question Box, Homer E. Niesz, Editor, Chicago.

THURSDAY, JUNE 8—EVENING SESSION.

Executive Session.

Report of Secretary and Treasurer.

Report of Executive Committee.

Report of Committee on Relations between Manufacturers and Central Station Companies, Henry L. Doherty, Chairman, Denver, Col.

Report of Committee on Standard Rules for Electrical Construction and Operation, Charles L. Edgar, Chairman.

Election of Officers.

General Electric-Westinghouse.

(From the Boston Financial News.

Westinghouse Electric & Manufacturing Company's stock is selling at $165 a share, against $184 on April 6 and $152 on May 20. General Electric is selling at $173 a share, against $192 on March 16 and $169 on May 20. The former paying 10 per cent. returns 6 per cent. to the investor, and the latter paying 8 per cent. is now yielding 4.6 per cent. General Electric, according to the last annual report, published recently, showed 19 per cent. earned on its stock, and from a very reliable source it is understood that Westinghouse is now earning over 20 per cent. for its shares. General Electric at present is earning over 19 per cent. on its shares. Therefore, Westinghouse is earning 13 per cent. on its selling price and General Electric over 11 per cent.

There is no doubt that there is considerable jealousy between the two companies at present. Westinghouse claims to have grown much faster than General Electric and General Electric is said to feel very keenly the fact. The patent agreement between them, however, will keep them from any open break for at least seven years, the remaining time the agreement has to run. It looks now as if General Electric would have an advantage shortly from the expiration of two basic Tesla patents held by Westinghouse, but at the end of two years the famous controller patent of General Electric will expire, and then Westinghouse will be the gainer.

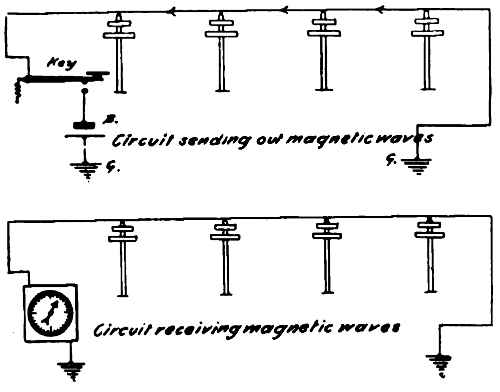
Some well informed Pittsburg people claim that the Westinghouse has been violating its agreements with the General Electric and has been cutting prices severely in order to get new business.

ELECTRICITY LEAFLETS.

BY NEWTON HARRISON, E. E.

Telegraphy Without Wires.

Systems of Wireless Telegraphy.—Systems of wireless telegraphy may be classed with reference to the devices employed and the principle put in operation. In either case the operation is dependent upon the radiation of a set of signals representing a certain code. The radiations or waves are etheric, that is, they consist of vibrations of the ether. These waves, or impulses, propagated through the ether are produced by electro-magnetic means. The action transpiring may be classed therefore with respect to the nature of these impulses. Preece of England developed a system of telegraphy which was carried on through the electro-magnetic induction of one line upon another. The distance over which signals could be transmitted was limited and experience has shown that the system inaugurated by the experiments of Dr. Hertz is the only practical system to employ for long distance telegraphing without wires. The credit for the development of this idea, in a manner showing evidence of scientific and engineering genius, belongs to Marconi. The transmission of intelligence without wires over long distances is accomplished by the projection of waves of an electrostatic nature. They emanate from between the discharge knobs of a large induction coil. The principles of electro-magnetic induction are employed in the creation of the high pressure required for this purpose. The discharge of this pressure, under certain propitious conditions, is the process employed for the projection of far-reaching waves. While in many respects similar, yet not entirely different, the sending of a powerful beam of light from a high power search lamp over a distance of some miles, there to operate a peculiar piece of mechanism, is the general plan followed out in wireless telegraphy, so called. The light that is projected is not visible, the waves it represents are different in character from light itself, but it is an ether disturbance and as such falls within the double category of optics and electric waves, of light and electricity.



Key
B.
Circuit sending out magnetic waves
G.
G.
Circuit receiving magnetic waves

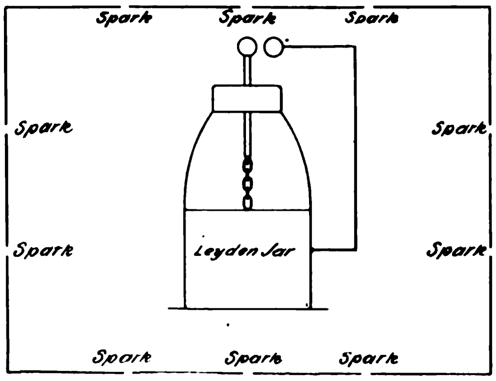
Electro-magnetic induction between two distant wires.

The systems of wireless telegraphy can very properly be included under the headings of the following:

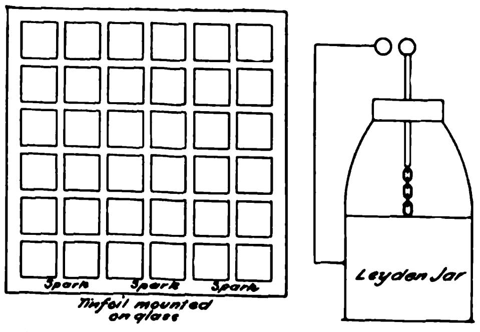
Wireless messages by electro-magnetic induction.

Wireless messages by electrostatic waves.

Application of a Condenser.—By the discharge of a condenser in a room around which was strung wires possessing fine saw cuts, Hertz was able to detect in these saw cuts or gaps delicate sparks. They were the evidence of waves sent out by the condenser when discharged, which swept across these conductors and superinduced in them, or between their ends, a difference of potential. If, instead of employing a wire with fine saw cuts to provide spark gaps, a sheet of tinfoil gummed to a plate of glass is employed and a series of fine knife cuts is made in this, the presence of sparks will be detected in a dark room on observation being made. The principle involved is simply that of employing a detector, as it were, in the form of a device upon which the operation of the waves becomes evident. Thus, two elements must enter into the constitution of a wave signaling outfit built along these lines:



Discharge of a Leyden jar and the effect of its waves upon the fine spark gaps in an adjacent circuit.



Sparks produced between tinfoil parts, separated by fine cuts, by electric waves.

First—The wave-producing device.

Second—A device acted upon by electric waves.

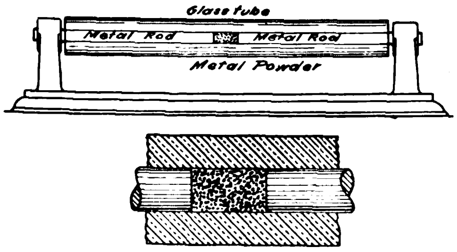
If the possibility existed of sending any other form of wave through the ether to a distant point the same conditions would have to be secured. The projection of the wave would require one type of apparatus, the receiving of the wave influence another type.

The Wave Gives No Signal.—A mistaken conception exists regarding the employment of electric waves for signaling purposes as in wireless or space telegraphy The electric wave does not give the direct signal. This is evidently impossible on account of the exceedingly delicate nature of the manifestation when received.

The function of the electric wave is to be the primary means of setting into operation apparatus which gives signals through the aid of a comparatively powerful current; in other words, it is this last-mentioned current which gives the signal. The means by which the delicate waves are able to impress the apparatus so as to cause a secondary and much emphasized signal can be best understood by reference to the tinfoil coating attached to a glass plate and divided into many parts by fine knife cuts.

A Wave Receiver.—If a few of the segments of tinfoil are connected to a powerful battery and an electric bell is placed in series as well the following condition of affairs is presented. The bell cannot ring no matter how many cells of battery are employed unless their voltage is so great that the current spontaneously leaps or arcs across the knife cuts, but if this condition does not take place the bell can ring if the tinfoil is short-cuited by connecting the tinfoil pieces together again. If neither of these things are done, however, the bell remains silent in series with the battery because of the breaks in the circuit due to cuts in the tinfoil. If any other means can be employed to bridge over these gaps then the bell will ring with great vigor. It is strange to realize the simplicity of the process, how the impact of the waves sent out by the Leyden jar or condenser sets up minute sparks between the tinfoil pieces, as previously stated. Across these sparks, as a bridge, the current of the batteries will rush and the bell will ring. The waves do not supply the electrical energy to ring the bell directly, but indirectly. They must be present to provide the path for the signaling current. It is this principle which is universally employed in a more or less modified form in all modern wireless telegraphic systems. Although it is claimed that no spark is in evidence in the sensitive wave receivers or detectors used in this form of telegraphy, still a change occurs in this device of so remarkable a character that part of a circuit, which before the wave impact occurred possessed so high a resistance that no current could pass; after the wave impact drops, so low in resistance that a relatively powerful current will pass and operate a relay and thus a sounder. The promulgation of an electric wave of a character that will operate upon a wave detector, a wave detector in circuit with a signaling device, and a signaling device which will always remain ready to receive new wave impulses unimpaired defines the requirements of modern wireless telegraphy. The wave detector, so called, which must naturally consist of a device which can form part of an electric circuit and be capable of a high and a low resistance when in service, is given the name of coherer. It performs the same function as the tinfoil sheet with fine knife cuts. It is sensitive to the waves and is thus the most vital part of a wireless system.

The Coherer.—The coherer generally consists of a tube of glass with a metal plug at each end and a pinch of metallic powder between the plugs. Sir Oliver Lodge employed a device of this description in circuit with a galvanometer and a few cells of battery. The theory upon which the application of this invention is based is that of the conductivity of finely granulated conducting substances under certain conditions. According to S. P. Thompson, the following is true in this respect and may be regarded as a valuable piece of information in connection with coherers: "The conduction of *powdered metals* is remarkable. A loose heap of filings scarcely conducts at all, owing to the want of cohesion or to the existence or films of air or dust, but it becomes instantly a good conductor if an electric spark is allowed to occur anywhere within a few yards of it. The resisting films of air are broken down by *minute internal discharges* in the mass. A very slight agitation by tapping at once makes the powder non-conductive."

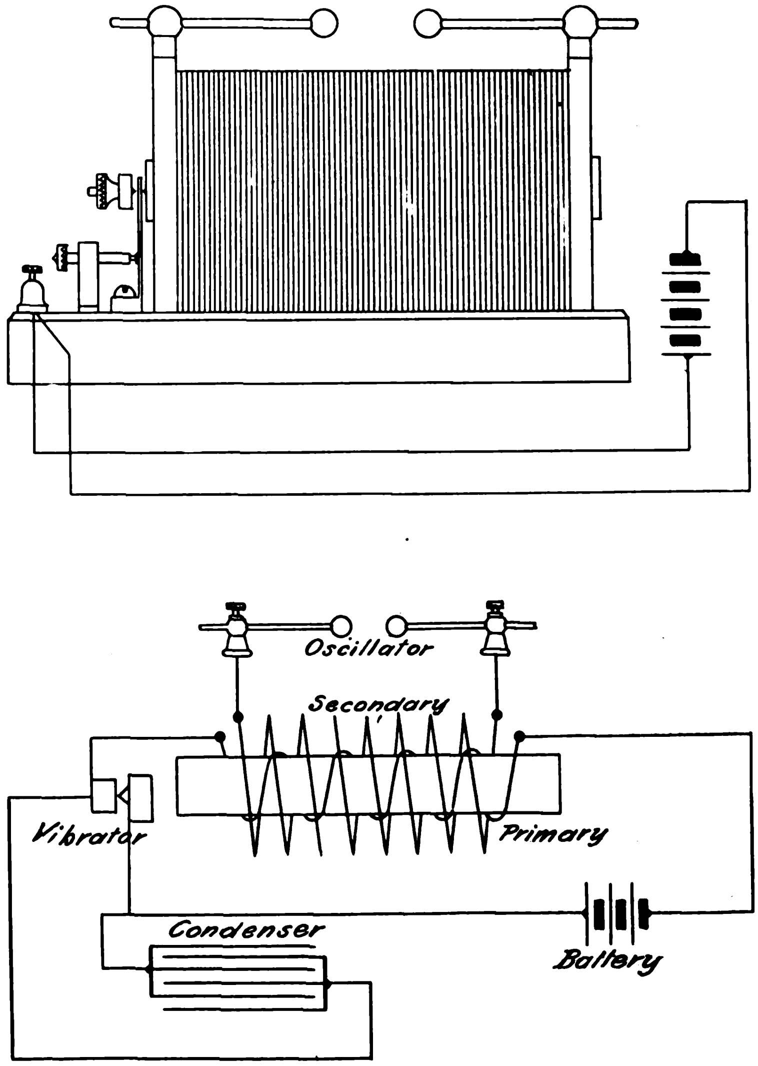


Mounted coherer, also enlarged section showing metallic powder and electrodes.

This most important part of the wireless telegraphic outfit thus consists of a pinch of metallic powder, largely nickel, with a touch of silver, contained within a small glass tube into the ends of which metal pins have been inserted. This device is placed in series with a few cells of battery and a telegraphic relay.

Under normal conditions the relay will not operate, but the presence of electric waves is the immediate cause of its action. They impinge upon the metallic filings and set up between them minute sparks. Over these paths thus provided the battery current instantly passes and actuates the relay. The relay in its turn operates the sounder and thus a signal is transmitted, as it were, almost by a breath.

Decohering.—The relay would persist in remaining in action and the current would continue flowing if some means were not supplied by which the metallic powder in the coherer is disarranged. This process is called decohering and simply consists of tapping the coherer after the receipt of a signal to avoid this difficulty. This is done automatically by means of a little vibrating hammer similar to those found in an electric bell, in fact, a small bell without the gong will perform this function perfectly if so connected up that its hammer just touches the glass tube of the coherer.



Appearance and Connections of a Spark Coil.

The Spark Coil.—The waves are produced by the spark coil according to the common acceptance of the idea. In reality they are produced by the condensers connected to the coil. If the coil itself produced the waves necessary in wireless telegraphy as understood to-day, the system would be electro-magnetic. It is, however, electrostatic, and the waves radiated or directed out into space are caused by the oscillations of electricity taking place in the outside circuit and tinfoil coatings of the condensers connected to the discharge points. Perhaps the discharge terminals are supplied with knobs and thereby dispense with their direct application, but whether this be true or not the waves are the direct result of electrical oscillations set up in the ether by the high tension discharge of the secondary winding.

Parts of a Spark Coil.—The spark coil consists essentially of a primary and secondary winding. In addition to these windings may be found a vibrator, by means of which the current in the primary coil is interrupted, and a condenser. Tabulating these parts with their function will simplify the explanations required:

Parts and Function of the Parts of a Spark Coil.

Primary Coil.—Receives the electrical energy and transforms it into magnetic energy.

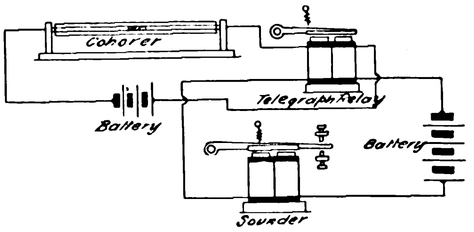
Vibrator.—Interrupts the current entering the primary coil, thus permitting induction to take place between it and the secondary coil.

Secondary Coil.—A coil of fine wire surrounding the primary coil. It receives the magnetic energy of the primary and transforms it by mutual induction into a high pressure current.

Condenser.—This is made in the customary manner of tinfoil and paraffined paper. It is placed in the break of the vibrator to take up the energy that would be otherwise wasted there by self-induction.

This will adequately convey an idea of the meaning of the parts of a spark coil and the co-operation expected of them when in operation.

The Spark Gap.—If the spark gap and the coil and its parts are considered, it becomes evident that the size and number of waves per second are dependent upon these conditions. A large bell produces slower and more sonorous vibrations than a small bell. In the same sense the spark gap of an oscillatory circuit will influence the character of the waves produced. It is stated that the wave length of an oscillator provided with very small knobs is twice the length of the oscillator circuit.



The receiving end of a wireless outfit.

Lodge used an oscillator consisting of a large polished brass ball between two of lesser size to act as the discharging end of a large coil. These waves possessed great penetrating power, passing through walls and wooden doors and houses as though they were transparent. The fact developed here is, that whereas visible light will only pass through glass in the customary manner, this new type of invisible light wave meets with no difficulty in passing through so-called opaque bodies. A metal screen is effective against them, however, as the waves are absorbed in this case, giving up their energy and decaying.

Sending Wireless Messages.—When the spark coil is set into operation a torrent of sparks will pass between the discharge knobs. The size of these knobs, the gap between them and the dimensions of the coil determine the reaching power of the waves. When a signal is to be sent the sparks are allowed to pass between the knobs by closing a switch. At the receiving end a coherer is affected by the waves propagated; either a long or a short signal is received as in the Morse code, the sounder or tape delivering the ultimate result. If a signal is to be transmitted the other way, the identical process and apparatus is employed. Thus with a good wave-producing coil and a sensitive coherer the fundamental parts are complete.

Antennæ.—To receive the waves, towers or metallic poles are employed called antennæ. The coherer is connected with them, and is thereby made more readily sensitive to electric waves in the vicinity. In transatlantic wireless telegraphy they are indispensable. Ocean liners are peculiarly serviceable in the art of telegraphing without wires, and in consequence, stations have been installed in many of them, thus keeping in communication with the shore of America or England or both while steaming over the ocean.

PROPERTIES OF SHEET STEEL.

The report of the researches carried out during 1904-5 by the holders of the Andrew Carnegie research scholarships has just been issued by the Iron and Steel Institute. The subject of the magnetic and electric properties of various kinds of sheet steel and steel castings is dealt with by Messrs. G. Dillner and A. F. Enstrom, of Stockholm, says the "Electrical Engineer," London. The chief object of the investigation was to study the influence of chemical composition and of manufacturing methods on the materials used in electrical engineering work, more especially in dynamo and transformer construction.

In summing up the authors deal with the influence exercised by various elements. The fact that an increase of the carbon percentage implies a corresponding increase of the coercive force of the hysteresis energy loss has been very distinctly borne out by the figures obtained for the sheet metal. The increase of the coercive force and the Steinmetz hysteresis coefficient have been found to follow a straight line within the range of a carbon percentage of .5 per cent. Thus it is obvious that a small amount of carbon is favorable in sheets used in armature cores and transformers. As regards the cast steel, however, it seems, to the authors that there ought not to be any inconvenience whatever involved in the increase of the carbon percentage, so far as is shown by the present researches. With the very highest percentage met with in the cast steel employed (carbon=about .30 per cent.) the authors consider the values of the maximum induction and of the permeability at the induction normal in field poles perfectly satisfactory, while the hysteresis properties of the pole material are comparatively unimportant. A high percentage of carbon also produces an increase in the electrical resistance, an effect which must be considered advantageous.

An increase of silicon has been found to be accompanied by a quite noticeable increase of the coercive force and of the hysteresis energy loss, whilst the maximum induction does not seem to be influenced to any noteworthy extent. As the hysteresis loss is thus so largely increased by reason of the presence of the silicon —a disadvantage, by far outweighing the corresponding gain as regards electric resistance—the conclusions to be drawn are that any addition of that element in making the steel ought, as a rule, to be avoided in the case of sheet material.

As to the influence of a similar increment of silicon in cast steel, the results have proved to be anything but unsatisfactory, the electric resistance being quite noticeably increased.

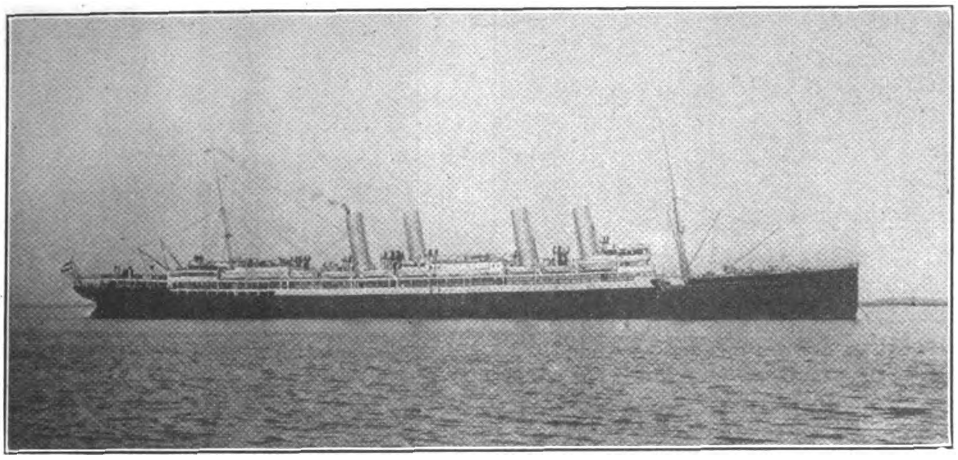
It has been stated that an addition of aluminum quite noticeably reduces the hysteresis loss, whilst it increases the electric resistance, and thus reduces at the same time the eddy-current loss. It has been found, too, that an addition of aluminum will reduce the maximum induction and the permeability for ordinary saturation values. The general conclusion is, therefore, that an addition of aluminum improves sheet material which is to be used for constructing dynamos.

As regards cast steel the matter is different. With such a high percentage of aluminum as is required in order to increase the electric resistance to an effective degree, the magnetic properties will be too much affected, and the authors point out that the usefulness of aluminum in cast steel is, to say the least, questionable. It is of interest, however, to notice the results obtained from the researches on cast-steel rods containing both silicon and aluminum. In this case low hysteresis losses are found, attributable, probably, to the influence of aluminum, whilst the influence of this element on the permeability and maximum induction seems to be neutralized by the addition of silicon. The addition of silicon and aluminum together seems thus to tend towards a general improvement of the magnetic properties.

THE ELECTRICAL PLANT OF THE STEAMER "DEUTSCHLAND."

BY EMILE GUARINI.

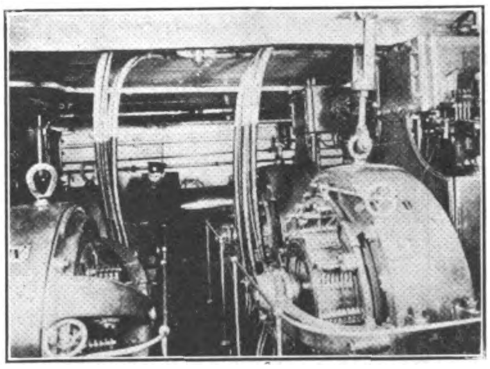
The electrical plant for illumination and transmission of power on board the fast mail steamer "Deutschland," of the Hamburg-American line, the largest and fastest passenger ship of the entire navy of the world, comprise what amounts to a municipal electric supply station of medium size. The entire electro-technical part was designed and constructed by the Allegemeine Electricitats Gesellschaft, Berlin. On account of the extraordinary dimensions of this steamer, namely 208.5 m. length, 20.4 m. width and 13.4 m. depth between upper deck and keel, 2,550 incandescent lamps were required for illumination, while 23 electromotors are used for operating the various supplementary machines. For all parts of the electric plant the necessary spare parts are also on board, and a special staff of men attend to the entire electrical apparatus under the supervision of two electrical engineers.



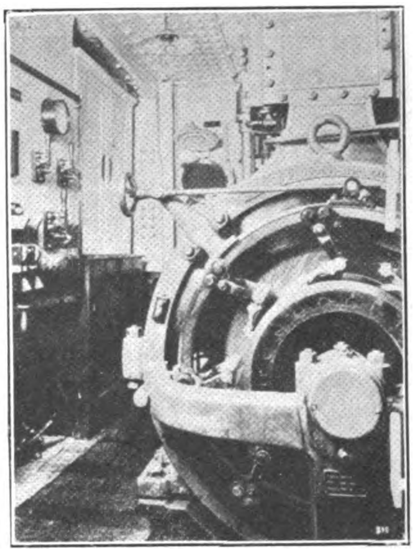
The Deutschland.

More than half of the motors serve for driving fans for the ventilation of the different lower rooms of the vessel. Two of these ventilators, which are erected on the upper deck, provide for fresh air supply in the cabins of the engine drivers and stokers. Four other larger fans serve for ventilating part of the stokehold. The motors, the shafts of which are coupled directly to the shafts of the fans, are suspended from the ceiling of the boiler rooms. Notwithstanding the coal dust, which is of course always present, and the unavoidable accumulation of moisture and dirt, the motors run continuously and quite satisfactorily, without special attention or supervision. Besides various elevators for coal, provisions, postal parcels and the like, a kneading machine in the confectionery department is operated by an electromotor with worm gearing. The starting resistance is situated close to the motor and can be readily operated by the confectioner. In the engine room there are two electrically driven drilling machines used for making small repairs during the voyage.

The lighting plant is very extensive. The distribution of the circuits is such that on an average five incandescent lamps are switched on one circuit and in the cabins up to six contact boxes are provided. Only in the saloons, where electroliers having several lights are used, circuits up to 12 lamps are allowed. Each passenger's cabin contains a lamp with two on-and-off switches, one being provided on the door and the other at the head end of the berth; furthermore, a wall plug for curling tongs heater or for ventilating fans is fitted. The staterooms are more amply provided with electric light, according to the elegance in which they are furnished; the same applies to the sitting rooms of the captain, chief engineer, assistant engineer, first mate and physician. The staterooms are also furnished with electric heating apparatus, stoves being provided in the sitting, sleeping and bath-rooms. Those passenger cabins that face the sea, and consequently have the benefit of daylight, are also connected to the general lighting plant, while those located towards the interior of the ship, and consequently dark at daytime, are connected to the pilot lighting plant. This plant comprises all the lamps which are required for service, and also for the safety of the vessel, passengers and crew, and especially for the illumination of the engine and boiler rooms; also the lamps which are required for harbor duties and for cleaning the saloons and those for the cabins of the crew, all the remaining lamps being connected to the circuit for the general illumination. The lamps in the rooms for steerage passengers are provided with water-tight protecting glasses and guards, like the engine room lights. They have, however, also a cast-iron protecting casing, which is open when the rooms are occupied by steerage passengers, but can be closed when these rooms are employed for stowing cargo. In the gangways between the cabins are provided more artistic fittings with opal glass globes. In the numerous rooms, which are furnished in an elegant style for the use of the first-class passengers, the electroliers are of tasteful construction, while all the electric leads are fixed behind the woodwork of the ceiling and walls. Special reference should be made to the first-class saloon in the middle main deck, the large dome of which gives light to all the three upper decks. The first-class drawing room and first-class smoking saloon on the promenade deck are also provided with the electric light in a manner suitable to their requirements. The promenade deck, which is practically open, is provided with special flat water-tight fittings. Near the cargo openings coal doors, likewise situated on the promenade deck level, are provided water-tight plugs for connecting hand lamps and reflectors which are employed for illuminating the promenade deck during loading and unloading when coaling and also on special occasions. All



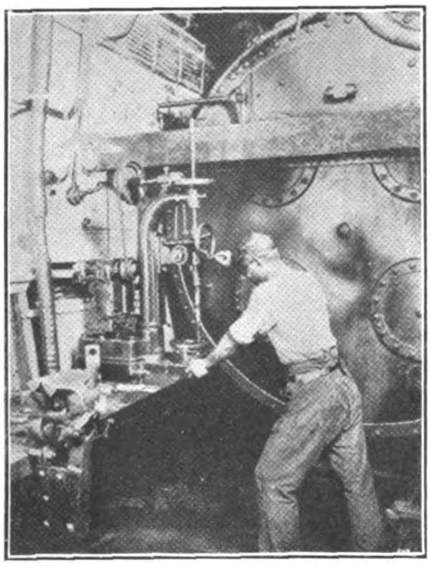
Lower Dynamo Room.



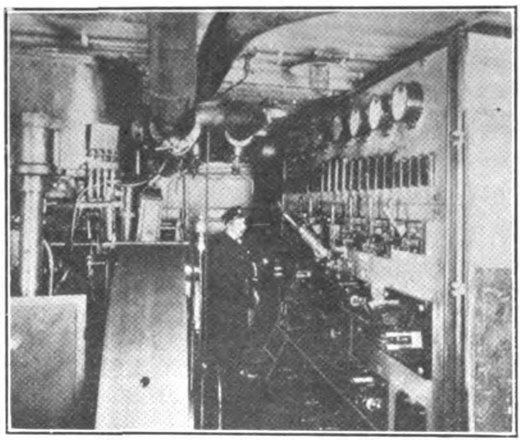
Smaller Dynamo Room.

the signal lights are operated by electric lamps, and especially the two ship's side-lights and the mast headlight. The latter is secured to the mast by means of a rope, the current being supplied through a flexible cable. In order that the captain or officer on duty may have a constant guarantee that these lamps are burning properly, they are directly connected to an electromagnetic controlling apparatus located on the bridge deck. This apparatus has three openings which are closed by white, red, or green panes of glass and show the same color the corresponding signal lamps are burning, whilst that pane of glass is immediately obscured when the circuit of the corresponding signal lantern fails. The stern lantern and also some lamps on the fore and quarter decks are constructed like the engine room lights.

The required current is generated by five steam dynamos, each consisting of a vertical compound steam engine coupled direct to a continuous current dynamo. The speed of these engines is 250 r.p.m. and the pressure of the current 110 volts. Three of these steam engines have cylinders 300 and 500 mm. in diameter with a stroke of 225 mm., while each of the corresponding dynamos gives an output up to 700 amperes. The remaining two smaller engines have cylinders 270 and 450 mm. diameter respectively, the stroke being 200 mm.; each of the corresponding dynamos has an output of 400 amperes. The windings of the dynamos are provided with special insulation; the magnet frame is composed of two parts, so as to readily enable the armature to be replaced in the limited space. The commutators are made of a special width and the current is collected by carbon brushes. The two larger and the two smaller of the steam dynamos are erected below in the vessel in the dynamo room, located behind the main engine rooms, between both propellor shafts. The fifth dynamo is erected in a second smaller dynamo room which is likewise accessible from the main engine room, but situated on the main deck above the water level. The current is conveyed from the four dynamos through iron-wire armored lead and rubber-covered cables to the main switchboard in the same room. The current is conveyed in a similar manner in the upper engine room to the smaller switchboard located therein and from these switchboards to the main circuit. This is composed of three principal parts—the pilot plant, the general lighting plant and the power transmission plant.



otor-Driven Drilling Machines.

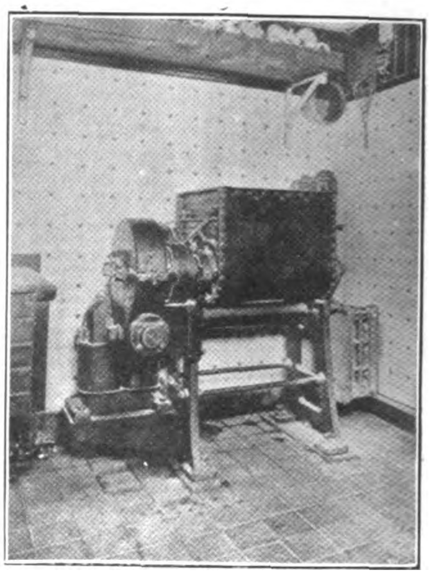


Main Switchboard.

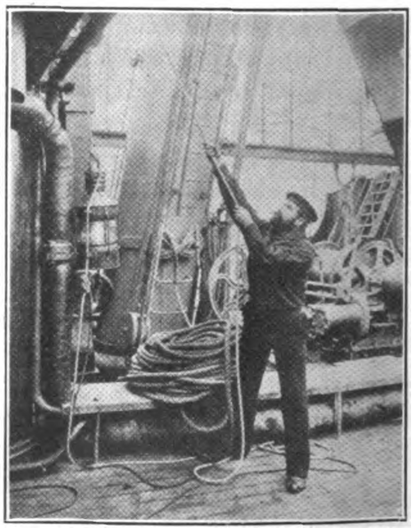
The circuits of the pilot lighting plant are fed from the switchboard in the upper room, while the general lighting and power circuits are fed from the main switchboard in the lower room.

Since the dynamos are not for working in parallel, the arrangement is such that by means of a four-part two-way switch each of the lower dynamos can be connected up to any circuit of the general lighting or to the bus bar of the power plant. By a similar switch, it is, however, also impossible to connect up each dynamo on to the switchboard in the upper engine room, that is, to the pilot lighting plant, for which purpose a trunk main is provided between the upper and lower switchboards. This conductor is in direct connection with a two-way switch by means of which any one of the lower dynamos or the upper dynamos can deliver its current to the upper switchboard. Dead-beat instruments made by the A. E. G. are used as measuring instruments, as they work accurately in any position notwithstanding the rolling movements of the vessel.

Connecting Hand Lamps and Reflectors.



Motor-Driven Kneading Machine.



Masthead Light Supplied Through a Flexible Cable.

In the engine and boiler rooms, the conductors are connected as a ring main, to which are attached water-tight boxes for the single lamp circuits. Each box contains eight branch circuits for one lamp, with the necessary safety fuses and cut-outs. Like the branch-circuit boxes in the engine and boiler-rooms, there are provided in the remaining parts of the vessel distribution boxes from which the conductors lead to the lamps. The boxes are distributed in such a manner that those spaces, which by their position or their use constitute a group, have always one common distributing box. Each box consists of a marble slab upon which the necessary switches and safety fuses are provided and embodies both the pilot lighting and the general lighting plant, for which the back part is provided with separate bars having a separate current supply. The connection of all the conducting wires takes place at the back of the distribution-box, from whence the wires are led into the adjoining wood casings. The single switches are provided with small plates, on which the individual circuits are indicated. All circuits are protected by 10 ampere plug fuses.

A NEW AMERICAN ELECTRIC ROAD ELEVATOR.

BY FRANK C. PERKINS.

The accompanying drawing, Fig. 1, and illustrations, Figs. 2. and 3, show a most interesting electric road elevator or rolling road for horses and wagons, as installed and operated on Factory Hill, in Cleveland, O. This electric road elevator is very similar to the incline elevator used in stores for carrying shoppers from the lower to the upper floors. The horses and wagons on moving upon the incline are carried up the 20 per cent. grade, and are deposited at the top of the hill without effort on the part of the men or horses. The main portion of the city of Cleveland is located on a level nearly 70 feet higher than that section occupied by the coal yards, lumber yards and manufacturing plants which are situated along the Cuyahoga River on the Flats. On account of the great amount of traffic and heavy teaming required from the Flats to the upper level, a long distance has to be traversed through various streets by the wagons and carts, and the loads hauled must be comparatively light on account of the heavy grades. By the installation of this electric road elevator by the Cleveland Rolling Road Company, which was designed by Col. I. D. Smead of Cincinnati, O., the horses, wagons and other vehicles are able to take the most direct line from the Flats, the rise of 65 feet in about 400 feet being made by means of this mechanism in a few minutes, while heretofore from half an hour to an hour was required to mount the hill by the roundabout way. This electric rolling roadway runs on several thousand small wheels; the roadway revolving around an immense sheave at the upper end, the returning belt running underneath on idlers provided for the purpose to a similar wheel or sheave at the lower end of the incline.

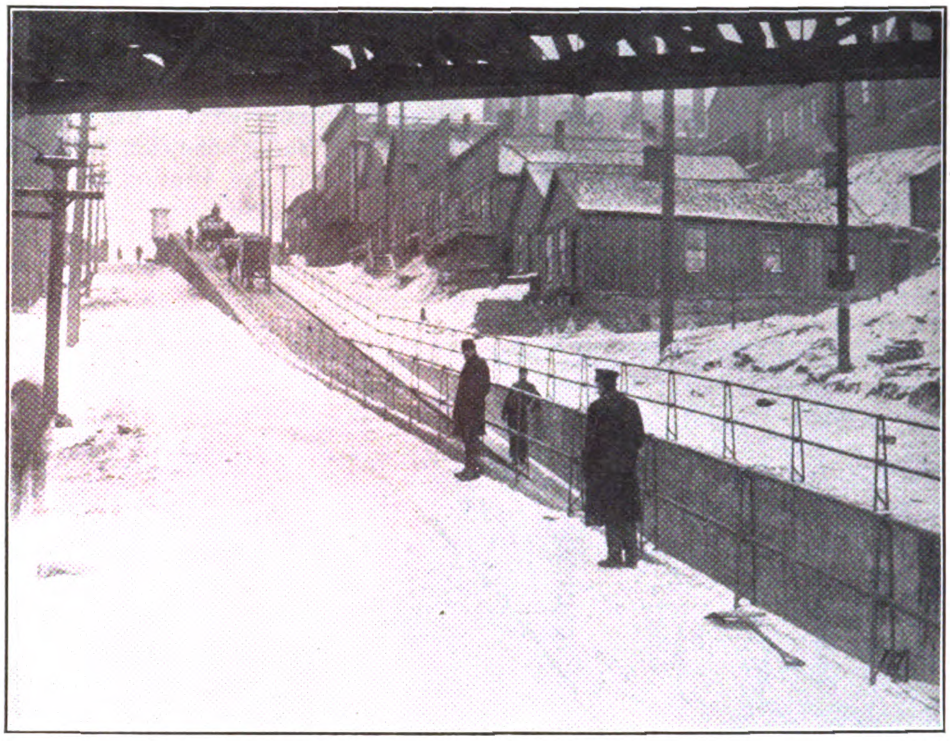


Fig. 2.—On the Hill by the Electric Road Elevator.

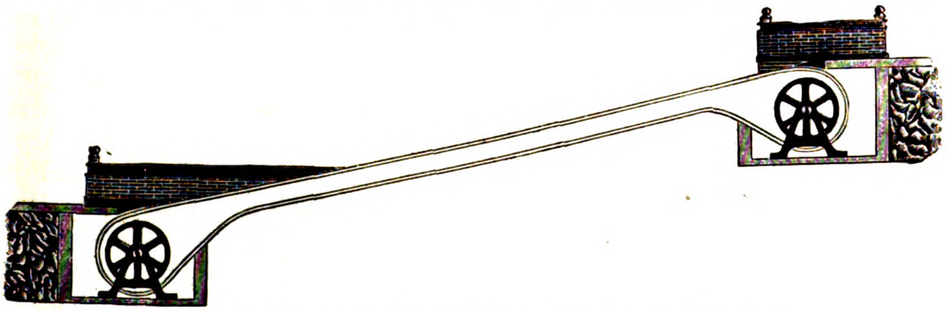

Fig. 1.—A New American Electric Road Elevator.

The capacity of the road is about 600 vehicles per day, and the horses while somewhat surprised pay little attention, seldom being alarmed, even for the first time. The speed of the electric rolling road is about three miles per hour and a number of wagons can be handled at the same time, as the roadway can be started and stopped when desired. The operating mechanism consists of four electric motors placed at intervals along the incline, all of which are operated by a single controller, the endless belt being started and stopped any time. The vehicles are driven upon the rolling roadway, one at a time, as many as six wagons having been carried up the incline at the same time with loads as high as nine tons, including the horses and wagons, while the time required for the trip is about three minutes, including the stops necessary for the other vehicles to get off and on the rolling road. It is stated that the cost of transportation of teams up this incline is about 10 cents per trip, thus saving a number of times this amount in case the vehicle with a much lighter load was required to take the roundabout way, with the additional wear and tear on the horses and vehicles and the increased time required.

PROGRESS IN THE ELECTRO-CHEMICAL AND ELECTRO-METALLURGICAL INDUSTRIES IN EUROPE IN 1904.

BY JOHN B. C. KERSHAW,
London.

Aluminum.—The production of aluminum in Europe is at present stationary, and is estimated by the writer to be about 4,500 tons per annum in the six factories engaged in the industry. During 1904, however, the British Aluminum Company extended its reducing plant at Foyers in Scotland, and is now generating machinery equivalent to 6,300 hp. installed. The manufacture of calcium carbide under the Willson patents at this works has been suspended, and the whole of the power is to be devoted during 1905 to the manufacture of aluminum.

Since the output of the six European works is at present only about one-half the capacity of the generating plant installed, a considerable increase in production may be expected shortly. A new company for promoting the manufacture of aluminum in Italy was floated in Rome last year, and a works is to be erected for this purpose in the valley of Pescara. Native bauxite will be employed as raw material.

As regards utilization there is nothing new to report during 1904, beyond the formation of an English company to exploit the Goldschmidt patents in the United Kingdom. These patents relate to the use of aluminum and oxide of iron, in the form of a powder named "thermit," for obtaining very high temperatures for welding and other metallurgical purposes. The new company has been called "Thermit Limited," and has a capital of $240,000. The fused mass of alumina, produced when "thermit" is fired, is also being employed for trade purposes, under the name of "Corubin."

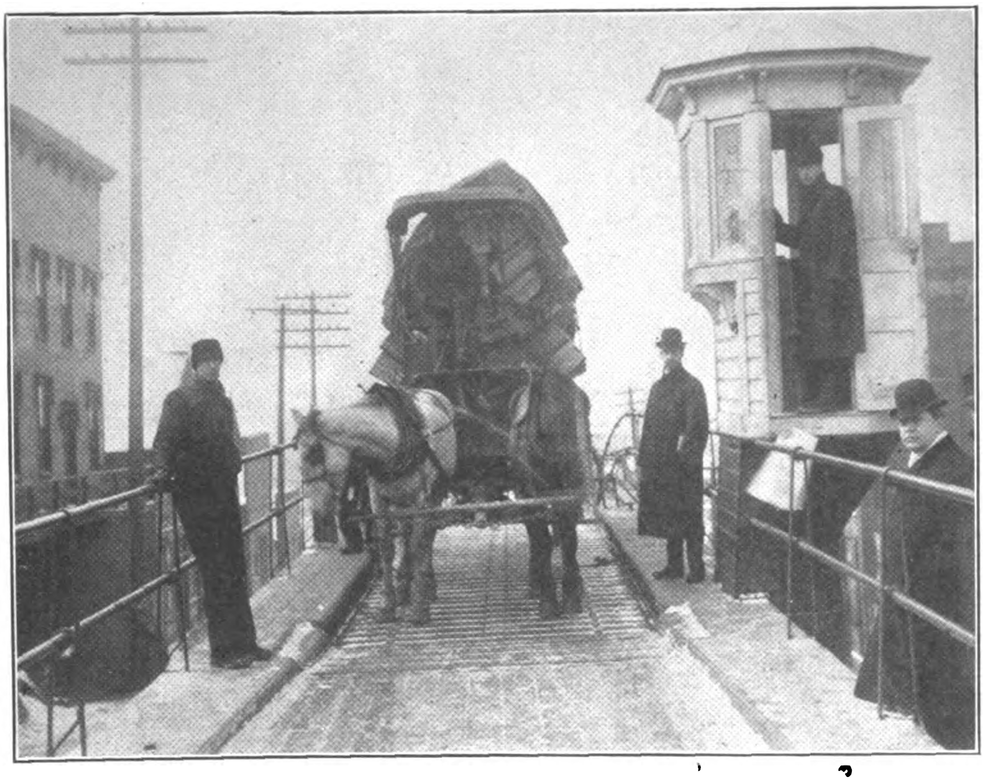

Fig. 3.—Scene on the Electric Road Elevator.

The use of aluminum for overhead transmission lines in place of copper does not make much headway in Europe, as the distrust of engineers in the durability of the metal when exposed to damp climates, has not been overcome.

Two Sheffield artisans patented, during 1904, a method and process for obtaining adherent deposits of silver upon aluminum, which may have some important effect upon the electro-plating industry. At present, copper or white metal, is usually employed as the base metal of all silver-plated goods, and this invention will substitute for these a lighter and cheaper metal. It is, however, yet too early to pronounce a definite opinion upon the success of this innovation.

Alkalies and Bleach.—The electrolytic alkali and bleach industry has not been in a very flourishing condition during 1904 The effects of the rupture between the La Blanc and electrolytic makers which marked the year 1902, and the consequent fall in the price of bleach, have not been entirely remedied by the modified form of agreement which was adopted in 1904. The price of bleach has not reached its former level of $30 per ton, and at present is only about $21.87 f. o. b. Liverpool. Consequently most of the electrolytic alkali makers in Europe, find the manufacture of this chemical unremunerative, and are seeking other outlets for the chlorine produced in their electrolytic alkali cells.

In this country the Castner-Kellner Company is making zinc chlorine by the Swinburne-Ashcroft process; in France the Societe la Volta, at Moutiers, is producing carbon tetra-chloride; and in Italy the Electrolytic Alkali Company, with works at Piano, is manufacturing carbon tetra-chloride, and pure hydrochloric acid. Attention is also being given to the industrial recovery of the hydrogen escaping from the cathode compartments of the cells (1 ton of hydrogen is produced for every 35 tons of chlorine); and in Germany and France this gas is being collected, dried, compressed and sold in steel cylinders for various purposes.

As regards dividends, the Electrolytic Alkali Company, which works the Hargreaves-Bird process at Middlewich, has passed its dividend upon the ordinary and preference shares during 1904, while the Castner-Kellner Company, with works at Weston Point, has been obliged to reduce its distribution from 6 per cent. to 4 per cent.

Calcium Carbide.—The Willson patents for carbide production, purchased in 1895 by the Acetylene Illuminating Company, have been declared invalid in the United Kingdom during 1904, as the result of litigation carried to the final Court of Appeal in the House of Lords. The manufacture of carbide under these patents at Foyers in Scotland has ceased. Only two small works are now producing carbide in the United Kingdom—at Ingleton, Lancashire, and at Askeaton, in Ireland, respectively, and the bulk of the carbide used is imported from Norway and Sweden. The total number of carbide works in Europe, now operating, is estimated by the writer to be about 45, and the output about 50,000 tons per annum.

As regards utilization the use of acetylene gas for illuminating purposes in country districts, is undoubtedly extending in Europe, and it has recently been stated on good authority that there are 150 central installations of this type now in existence. In the United Kingdom 16 towns and villages are provided with acetylene gas from a central generating station, and the average price charged for the new illuminant is stated to be $13.26 per 1,000 cubic feet. An improved form of acetylene lamp is now being tried upon the London omnibuses with some success, and the lamp, so far, promises to be more satisfactory than that tried two years ago.

The consumption of carbide in Italy and France in 1902 was stated to be about 13,000 tons in each case, and the consumption in Germany in 1904 has been estimated to amount to 20,000 tons.

Chlorates.—Little change has occurred during 1904 in the electrolytic chlorate industry. The number of factories in operation in Europe remains stationary at six, and the aggregate power available for the manufacture in these six factories is about 25,000 hp. No very reliable figures can be obtained for the output of chlorates by these six factories and estimates based on the total power are misleading as some of the factories manufacture other products. Chlorates now command a very low price on the market and the tendency is for these works to devote an increasing proportion of their power to the manufacture of persulphates, perchlorates and similar salts.

Copper.—The electrolytic copper refining industry is practically stationary in Europe, though still expanding in the United States.

This position is due to the fact that most of the raw copper suitable for the electrolytic refining process is mined in America, and that this raw copper is now refined on the other side of the Atlantic. The European refineries, according to Ulke, No. 23, provide only 14 per cent. of the total output of refined copper. The latest available figures are for 1903, and show an output of 324,000 tons of refined copper, to which total Europe contributes only 45,360 tons. These figures indicate that the European refineries, though numerous, are small in size, and that difficulty is met with in keeping them provided with raw copper for the vats.

The companies which operate the Elmore process for manufacturing tubes by electrolyte deposition, at Hunslet near Leeds, and at Schladern in Germany, have not been operating very successfully in recent years and the former company has been completely reorganized in finance and management during 1903-1904. The electro-metallurgical processes for treating poor copper ores to a preliminary smelting in the electric furnace, in order to obtain a concentrated metal, are still receiving trial in France and in Chili.

Ferro-alloys.—The manufacture of special alloys of iron with chromium, manganese, tungsten and silicon in the electric furnace has become an important branch of electro-metallurgical industry, and the number of works which are engaged in manufacturing these compounds in France, Switzerland and Germany, is a large and increasing one.

Ferro-chrome, which is employed in the manufacture of tool steel and armor plate, on account of its hardening properties, is produced at Froges and La Praz in France by the Heroult furnaces, at Albertville by the Girod crucible furnace, and at Essen in Germany by the Goldschmidt aluminum reduction process. A plant for operating the Girod crucible furnace is also being erected at Courtepin in Switzerland, and here numerous special alloys of iron and steel are to be made. Ferro-manganese is stated to be a product of a works situated at Orlu in the French Pyrenees. Ferro-silicon is manufactured at a great number of works and the output has grown so large that a central bureau has been called into existence for regulation of the production and price.

The carbide works at Landeck and Matrei in Switzerland have recently taken up the manufacture of the last-named alloy.

Hypochlorites.—The low price at which bleaching powder is now being sold in Europe is retarding the development of the electrolytic hypochlorite industry—and thus the success of electrolytic methods in one direction (namely the alkali and bleach industry) is retarding their progress in another.

Kellner has recently patented in Europe a method of producing and using a hypochlorite of lime solution for breaking up wood fiber, which is electrolytic in character, and is similar to the processes that have been used in certain wood pulp mills in the United States for some years past. Two companies are exploiting hypochlorite cells in the United Kingdom, namely, the Electrical Bleaching Company and Oxychlorides Limited. The first-named company controls the Vogelsang cell and patents, the second, the Atkins cell and patents. Neither company has yet obtained any very striking results.

In Germany, the Schuckert and Haas & Oettel cells are most frequently heard of in connection with electrolytic bleaching plants.

Iron and Steel.—The use of the electric furnace in the iron and steel industries has been forced into much prominence during 1904 by the visit of a Canadian Government Commission of experts to Europe to inspect and report upon the prospects of the various furnaces and processes in operation upon an industrial scale in France, Sweden and Italy. The reports of the experts attached to this commission were published towards the end of 1904, and have received much attention in the technical press. The reports are favorable to the new methods, especially as regards the manufacture of high-class steels, and therefore there is likely to be a rapid growth of this new branch of electro-metallurgical industry in all countries in the next decade. Although Siemens experimented with an electrically-heated laboratory furnace for melting steel in 1879, the more serious experiments with the electric furnace in the iron and steel industry dated from 1899, when Stassano at Rome and Heroult at La Praz, commenced their trials with different types of furnaces.

The former attempted to make steel from the raw ore in one operation, the ore, coke and lime being pulverized and formed into briquettes with some suitable binding material before submitting it to the action of the electric arc. Although much money has been expended upon these experiments, the success of the Stassano process and furnace is still in doubt and it remains to be seen whether a process of this character can be made to pay at present except under very unusual conditions.

The Heroult process starts, not with ore, but with scrap iron and steel, and from these materials high-class steel of any desired chemical constitution is produced. The method of manufacture is based upon first washing out all the impurities by means of suitable slags, and then adding alloys containing the required constituents in sufficient amount to produce the finished steel desired.

The Heroult process and furnace has been developed at La Praz in France and at Kortfors in Sweden, and over 4,000 tons of steel have been produced at these two places. Arrangements have now been made for introducing it into Germany and the United States.

The Keller furnace is another for producing steel from scrap, which has been working in France for the last three years, at Livet and at Kerrousse, near Morbihan.

The Keller steel refining furnace in its principle details resembles the Heroult furnace, but Keller has also designed one for making pig-iron from the ore, which has some features of peculiar interest. In this furnace, two vertical chambers which contain the electrodes and charges of ore, coke and fluxes, are connected by a channel at their lower ends—and when this channel fills with molten iron the latter begins to act as electrical conductor, and changes the action of the furnace from the arc to the resistance principle of heating. Cast-iron of various grades has been made in this type of furnace with success, but the Canadian commissioners indicate in their report that under normal conditions it cannot compete with the modern blast-furnace.

The third furnace seen in operation by the commissioners was at Gysinge in Sweden and is known as the Kjellin furnace. This operates on a totally different principle to the other two, the heating of the charge being due to induction currents. Either cast-iron or high-class steels can be made in this furnace, and the results obtained when working with scrap-iron and steel as raw materials of the charge, and when producing from this high-class steels, were fully equal to those obtained at Livet and La Praz with the Keller and Heroult process. The cost of electrical energy per ton (2,000 lbs.) of steel produced in the furnaces varies from $1 to $1.52 with the EHP. year at $10. This, it must be observed, is only one-half the rate charged at Niagara, so that the new electric steel processes will require a very cheap power supply if the above figures of cost are to be realized.

Nitric Acid and Cyanides.—Much attention has been given in Europe during 1904 to the problem of obtaining nitric acid and cyanides from the nitrogen of the air and some progress has undoubtedly been made in the solution of this problem.

Birkland and Eyde, two Swedish chemists, have been experimenting with a spark discharge method, similar in many respects to that employed by the Atmospheric Products Company (Bradley and Loejoy's patent) at Niagara Falls, but the two Swedish inventors use a moving magnetic field, in place of a mechanical device, to break the arcs when formed. The yield of HNO_3 by this method is stated to be 900 kgs. per kilowatt year, and the air after submission to the action of the spark discharge is said to contain ⅔ per cent. of NO, which is finally oxidized to N_2O_5.

A large number of laboratory investigations relating to the same subject have also been carried out during 1904 by Brandt, Muthman and Hofer, von Lepel, and Auer.

As regards cyanides, the Siemens & Halske and Franke process, for production of calcium cyanamide, by heating lime and charcoal to 2,000 degs. C. in an electric furnace and then passing air over the heated mass, is in operation in Berlin, and the product is being sold in Germany under the name of "kalkstickstoff" as a manure. Sodium and potassium cyanide can be obtained from this compound by double decomposition. A works for carrying on this manufacture on a large scale is to be erected in Italy by a company having its headquarters in Milan. The German patent for this process is No. 16,298 of 1902.

Nickel.—There is nothing new to report concerning the use of electrolytic methods in refining this metal.

Tin.—The electrolytic methods for stripping tin scrap are making progress, and in time the writer believes that every large city in Europe and America will be provided with a factory for carrying on this process.

The Bergse process, in use in Copenhagen, was described in various magazines during 1904. Stannic chloride is used in this process as solvent in place of sodium hydrate, and the results obtained are stated to be good. Chemical methods of detinning scrap by aid of electrolytic chlorine are also receiving attention. A large detinning works is now in operation in London.

Zinc.—The Swinburne-Ashcroft zinc extraction process is being employed at the Castner-Kellner Alkali Works at Weston Point, chlorine gas from the electrolytic cells being used to decompose the mixed sulphide ores. The plant at present in use can deal with 40 tons of ore per week and extensions are possible.

The Laval furnace and process is undergoing industrial development in Germany and Sweden. This is an electro-thermal process, arc heating being employed, the zinc being driven off as a vapor and finally condensed. By the exclusion of air from the furnace the formation of oxides is avoided.

THE PRODUCTION OF ELECTRICAL POWER.*

Amongst the accessory appliances in use in a power station secondary batteries or accumulators claim some attention because of their importance.

Accumulators are made of lead grids, filled in with oxides of lead. These are immersed in dilute sulphuric acid. When a current from a dynamo or a battery is passed through the accumulator cell some of the water may be considered, for all practical purposes, to be electrolyzed or split up into its components, hydrogen and oxygen. The oxygen appears at the anode, or the plate of the cell at which the current enters, the hydrogen at the cathode or the plate by which the current leaves cell. Now the hydrogen liberated at the cathode attacks the lead oxide and takes some of its oxygen from it to form water, and leaves the equivalent amount of lead on the cathode. The longer the current is continued the greater is the amount of oxide reduced to lead. This action, however, does not go on until all the oxide on the cathode is reduced, as the surface is acted on first, and the lead forms an outer coating which to some extent protects the inner portions. The oxygen at the anode acts on any oxide on this plate, converting it into lead peroxide, a dark brown substance containing more oxygen than the other oxides of lead.

If the connections at the terminals of the cell are now reversed so that the current flows through the cell in the opposite direction, hydrogen is produced at the plate which previously was the anode, but which has now become the cathode. The hydrogen attacks the peroxide of lead, taking its oxygen and reducing it to metallic lead. This lead, thus produced, is in a very porous or spongy state. The oxygen liberated at the plate which was formerly the cathode, but now the anode, attacks the lead formed previously, and it does this the more readily owing to its spongy state. Lead peroxide is formed as before described. This process may be repeated and each time the action goes further, until the cells are in a condition such that the action can get no further. The plates are then said to be fully formed. In the acid we then have two different plates, one of which may be regarded as lead, and the other as lead peroxide, and these plates are necessarily at different potentials because of the different action of the acid on them. On connecting the terminals to a voltmeter, we find that there is a difference of somewhat over two volts between them. Hence if we connect them by a wire they will give rise to a current just in the same way as a primary battery. The current will flow for a considerable time, provided too great a current is not taken from the cell. The voltage of the cell keeps up remarkably well, but of necessity there is a decrease as the action goes on, for the lead is gradually oxidized and the lead peroxide reduced.

The current produced by the cell leaves by the brown lead peroxide plate. This is, therefore, termed the positive terminal, or pole, of the cell, and is usually painted red. When the voltage has fallen to 1.9 or thereabouts the current should be stopped and the cell recharged by sending in a current at the positive terminal, thus again producing lead peroxide at the positive plate. In this way the cell can be recharged and used over and over again, and, in a certain sense, we can speak of these secondary cells as accumulators, for we charge them by means of an electric current, and we can take a current from them when we wish. The explanation just given of the chemical action taking place in the cell must not, however, be taken as being complete. As a matter of fact the action is very complicated, persulphuric acid, persulphates of lead, and other substances being formed. The above, however, gives a general idea of what is taking place. The cells used in the power-station each contain a number of plates, but these are connected together in such a way that they really form two large plates for each cell. These cells possess many advantages in addition to their capability of being recharged: they give a comparatively constant voltage, and have a very low resistance, so that very little energy is wasted in the cells themselves. Great care must, however, be taken in using them, otherwise they are soon spoiled.

---

* Abstract of article in "The Tramway and Railway World," London.

In practical use in the power-station we may explain their usefulness by saying that they are used to equalize the loads on the dynamos. Both dynamos and steam engines work most efficiently when the load on them is constant. Now, on a tramway system sometimes the current required is much smaller than at others. At such times the energy given by the dynamo is utilized for charging the accumulators. The dynamo and battery are connected up so that this is done automatically. At other times, say when a considerable number of cars happen to start at the same time, a sudden load is thrown on the dynamo, but if this is connected up with the battery the latter takes part of the load. In this way the battery acts as a kind of a buffer to the dynamo, and consequently to the engine also, for if the load on the dynamo is kept fairly steady the power required from the engine and boilers remains steady also.

In some cases a battery of accumulators is used for working a tramway system during some parts of the day. This method has been adopted in some combined electric lighting and traction power stations where the dynamos are used during the daytime to work the cars and charge the batteries, while at night the dynamos are used for lighting and the battery for working the tramways.

In many power-stations are now to be found small machines, known as boosters. A booster is practically a motor and dynamo combined. It is used for modifying the drop in voltage on the feeders of a tramway system, or on the track which is used as the return conductor. When the booster is working one of its terminals is at a higher potential than the other, and this potential difference may be made to have any value required according to the winding of the machine and the speed at which the armature rotates. If it is required to raise or lower the difference in potential at two points on the circuit, this can be done by connecting the two points to the two terminals of the booster.

Boosters are also frequently used for charging the accumulators instead of connecting them direct to the dynamo. When used for this purpose they are called milking boosters. This name seems to have been given to them because when the battery is almost fully charged the gases liberated escape through the liquid, making the liquid appear white and semi-transparent or milky.

ELECTRICITY AND FIRE INSURANCE.*

BY A. H. MAYES.

The unfair and inconsistent attitude adopted by many fire insurance companies with regard to premises wherein electric power for lighting and motive purposes is used, is of such wide importance that a little plain speaking will be entirely justified. In the first place, it appears that the powers that guide the helm of the insurance companies have by some mental process, which it is beyond the power of a practical and impartial person to understand, arrived at the conclusion that a supply of electricity on a premises is a source of considerable fire risk, greater, in fact, than had gas or some other agent been employed. Now, looking at the matter honestly and with a perfectly unbiased mind, one is compelled to say at once that such a contention is absolutely unjustified, opposed to common sense, and totally unsupported by the result of experience.

Even allowing that every fire attributed to electrical causes is rightly classified, it cannot be denied that electricity still stands forth as by far a safer agent than gas. It is quite certain that a little more attention in detail in carrying out installations would still further reduce the possibility of fires from electrical causes, and the writer proposes to say a few words upon this from a practical standpoint. How often one sees the cause of fire vaguely attributed to "the fusing of an electric wire." Now, either the fire was not caused in this manner at all or else the wire in question must have been installed under conditions sufficiently extraordinary to take one's breath away. The smallest conductor ever used, or which is supposed to be used for installation purposes, is No. 18 S.W.G., and as the fusing current of No. 18 S.W.G. copper wire is 108 amperes, one is led to ask what sort of branch fuse was in circuit with that unfortunate wire. The alternative conclusion is that there was no fuse at all, and, furthur than that, one is confronted by the appalling question of how such an enormous current could have found its path, even then, through the wire in question. If due to earthing of the wire, the earth must, indeed, have been of an efficient character, and if due to a "short-circuit" the point of contact must have had a strangely low ohmic resistance. Even then we are not out of our troubles, for we have yet to explain how the service company's fuses managed to stand against this great extra demand upon their energies. It will, of course, be evident that the danger point would be reached with a current less than that required to absolutely fuse the wire, but after making all allowances the point requires a large amount of explanation.

Another and more probable source of danger is in installing incandescent lamps in such a manner that the heated bulbs can come into contact with articles of an inflammable character. It is a common practice when installing lamps for lighting a draper's window to attach the lamp to a considerable length of duplex flexible conductor, in order that the light may be hung in any desired position, and thus it is that one frequently sees goods of a highly inflammable character in actual contact with the bulbs. Such a practice as this should be absolutely prohibited, and a rule should be strictly inforced that all lamps used under such conditions be inclosed in a wire net guard or other effective safeguard. The overheating of resistances used in connection with arc lamps is undoubtedly a source of danger, but at the same time one which might be rendered practically nil by proper precautions in the matter of carrying capacity and fixing.

Coming to the question of electricity as used for power work, we are at once confronted by an element of danger in the form of resistances as used for starting and speed-regulating purposes. Here again, however, proper precautions would reduce the fire risk to practically nil, but, unfortunately, great carelessness is often displayed in the method of fixing and protecting these pieces of apparatus. A short time since the writer was inspecting a large motor installation in London, and found gross carelessness displayed in the above matter. A 25 hp. starting resistance of the wire coil type had been arranged to stand upon the cement floor in the basement, and as the sheet-iron case containing the coils was open at the bottom, a quantity of waste paper and rubbish had gradually worked its way underneath, and actually found its resting place amongst the coils. The above apparatus should certainly have been fixed about a foot from the ground, and have been provided with a perforated iron bottom.

In several other instances it was found that starting resistances were quite unequal to the demands made upon them, having insufficient carrying capacity, and often attaining a red heat in operation. More care was, therefore, essential in selecting a starting resistance suitable for the particular work to be performed. It may be added that the switch and resistance should always be inclosed in an outer case of strong sheet steel which is an adjunct of a very necessary character on account of the fact that a considerable amount of sparking takes place upon the switch contacts, and particles of molten metal are at times thrown off. Main switches should most certainly be inclosed in cast-iron cases, as they are frequently liable to rough handling, and it often happens that an arc is set up owing to defective action.

---

*From the "Electrical Engineer," London.

Another important adjunct to power installations is the fuse, and unless a proper type be employed they are undoubtedly a source of fire risk. Whether the open or inclosed type of fuse be selected, there are two points of the greatest importance to be observed—that is, that the terminals shall be an ample distance apart and the device shall be inclosed in a cast-iron case.

If proper attention were paid to the above simple points the fire risk would be still further reduced, and would bring still nearer the day when fire insurance companies will be compelled to admit that electricity is by far the safest agent to employ for both lighting and power.

Motors May Be Cheapened by the Expiring Tesla Patents.

(From the Washington Star.)

There is a diversity of opinion as to the probable effect the announcement of the expiration of the famous Nikola Tesla patents, covering the alternating current dynamo, will have upon the electrical world.

Among the experts at the Patent Office and among conservative patent attorneys generally it is not anticipated that a stir will be created that will equal the one caused by the dying out of the Bell telephone patent. On the other hand, reports are current that many of the large factories of the United States, in anticipation of the expiration of the patents, have equipped their factories with machinery for manufacturing electric motors on a large scale.

The Tesla patents have been known for years as the "three fundamental patents." For years they have been in possession of what is called the "Patent Pool Trust," and Tesla has been drawing royalties from them. It is said that much of the money the picturesque inventor has received from this source has been applied to his experiments in wireless telegraphy. His mysterious tower at Wardencliffe, L. I., is said to have been built in part by money subscribed by J. Pierpont Morgan and in part out of the royalties received from the motor patents.

George D. Seely, the veteran electrical examiner at the Patent Office, looks for no great stir on account of the expiration of the patents. "There may be some little excitement," he said, "but it will not be an earthquake by any means. It will have the effect of lowering the market price of electric motors some, and probably some manufacturers not now manufacturing electric motors will put them on the market."

The field thrown open by the dying out of the patents is not so large as would appear at a first glance. While the three fundamental principles are absolutely necessary to the construction of an electric rotary motor, the improvements which have been made from time to time enter largely into making the motor of the great commercial value that it is to-day, and the patents on the improvements still stand good.

High-Speed Traction.

At the last meeting of the New York Electrical Society Mr. Charles A. Mudge, chief engineer of the railway department of the Allgemeine Elektricitats Gesellschaft, Berlin, lectured on "High-Speed Electric Traction." As Mr. Mudge took part in the high-speed electric tests on the Berlin-Zossen road, his description of the trials proved very interesting. In dealing with high-speed work the lecturer enumerated the following points, which, he claimed, had to be considered:

(1) Keep the car body as near the rails as possible; (2) arrange all heavy pieces of apparatus so that their centers of gravity lie in the center of the car, or in symmetrical relation therewith, and as near the earth as possible; (3) all apparatus mounted above the car floor should be as light as design will permit; (4) make the overhead trolley contact above, in preference to the side of the car; (5) support the motors flexibly on the axles of the trucks; (6) give the front end of the car a wedge shape; (7) support the car body on the truck frame at some distance from the center bolt, and allow it a flexibility in a line at right angles to the track, independent of the truck; (8) make the total wheel base of the truck of ample dimensions, and not less than 20 per cent. of the length of the car; (9) build the road as straight as possible and where more than one track is used make them farther apart than present practice; (10) on curves make the approaches of the elevated side of the track longer than present practice.

New York City's Central Station.

New York City has acquired the block bounded by East 90th street, Avenue A, East 91st and the East River as a site for the proposed central station for the supply of electricity to light the streets and public buildings in Manhattan and the Bronx.

The sale was consummated last week, the city paying $350,000 for the property, which includes 14 lots under water in addition to the block of land. A plot in Long Island City on Vernon avenue has also been obtained for the erection of a lighting plant to supply the Boroughs of Brooklyn and Queens.

Plans of the proposed building to be erected show a structure similar to the big power-house of the Metropolitan Street Railroad Company at Broadway and Houston street. The machinery to be installed will be the latest up-to-date make.

Points for Electrical Contractors.

Electric lighting works are wanted by the city of Nachod, Bohemia—also by Marburg, Germany, by Johannesburg, South Africa, by the municipality of Druten, Italy, and by the town of Beaconsfield, Cape Colony, South Africa. The electric light plants in Leipsic, Heidelberg and Emden, Germany, and Port Elizabeth, Cape Colony, are also to be enlarged.

Electric central power stations are to be constructed at Reichelsheim, Germany; Wallensch, Germany, and Sentino, Italy.

Electric cranes and other harbor improvements, to cost $930,000, are to be installed at Cape Town, South Africa.

Electric tramway lines are to be constructed at Nankin, China; Paris, France (to cost $3,897,000); Rome to Civita Castellana, Italy, by the Westlandsche Stoomtramway Maatschappi of Amsterdam: Goerz, Austria, Johannesburg, South Africa (consulting engineers, Mordey & Dawbarn, 82 Victoria street, London); Celle, Prussia, and by the Societe Generale des Tramways de Madrid, Spain, and several in Bohemia.

Chicago's Municipal Railway.

Contractors who desire to bid on the construction of the proposed municipal street railway system in Chicago can begin at once to prepare their proposals. Bion J. Arnold, the traction engineer, has filed the plans and specifications for the system with Commissioner of Public Works Patterson in that city. The plans provide for the construction of a trifle over nine miles of track, four miles of underground and five miles of overhead trolley, and all the power plants, cars, transmission lines, repair shops, telephone system and other appurtenances to a complete working system.

Proposals Invited.

The Navy Department, through the Bureau of Supplies and Accounts, is inviting sealed proposals until June 20 for furnishing Eastern navy yards with the following electrical supplies: Schedule 288, incandescent lamps, carbons, globes, switchboard extension. Blank proposals and specifications can be obtained upon application to the Bureau in Washington or to the Navy Pay Office in New York.

Sealed proposals are being invited until June 15 for the construction of an electric lighting system and current required at Fort Mansfield, R. I. Information will be furnished intending bidders on application to the Constructing Quartermaster, New London, Conn.

A Work of Instruction and Reference.

The Electrician's Handy Book, by T. O'Conor Sloane, A. M., E.M., Ph.D., is one of the finest pieces of electrical literature this season has produced. It is possible to go even furthur than this in words of praise without in the least encroaching upon the field of verity.

The contents of this volume are completely up-to-date and betray not only a painstaking care in preparation, but a breadth of view that gathers within its compass the latest and best in the theory and applications of electricity. Better than all this it is readable. Specialists in all departments of electrical engineering will find within its covers a fund of useful and well-presented information. It is well worthy of occupying a prominent place among the best books of the hour. Dr. Sloane has accomplished a great deal in this, his masterly resume of electricity.

This flexible backed book is published by the Norman W. Henley Publishing Company, price $3.50. The number of pages included between its covers are 761, and 556 illustrations and diagrams are employed to elucidate this most modern work of instruction and reference.

Latest Municipal Ownership Query.

When the city government of Chicago owns the street railways, will the cars have to wait for the Alderman's wife to finish doing her hair and get on her gloves?—"Baltimore Sun."

Reliance Instruments.

The latest improved Magnetic Vane Volt and Ampere Meters, recently brought out by the Reliance Instrument Company, 60–68 West Van Buren street, Chicago, are claimed to be very neat-appearing, accurate and reliable. These instruments have no permanent magnets and can be used on either A. C. or D. C. circuits. They are not gravity controlled. The pointer is held in position by two springs which have an exceedingly fine temper; the moving parts are very light and the coils are so arranged as to take the least possible current; the losses through winding as well as friction are reduced to the lowest point, and in this feature the Reliance Company claims its instruments are very superior to all other magnetic vane instruments.

RELIANCE
AMPERES
MADE BY
RELIANCE
INSTRUMENT
Co
CHICAGO, ILL.
U.S.A.

The amount of energy consumed in Reliance voltmeters for a full deflection of the scale is considerably less than the average instruments of this type, which means a great saving in the operating of a power plant or automobile charging boards, as a voltmeter is constantly in circuit and the energy consumed to indicate the voltage is a total loss to the plant. The construction of Reliance instruments is of the most substantial kind. The scale is five inches long and hand drawn from recognized standards, the moving parts working on hardened steel pivots in Jewel bearings. Standard finish of instruments—polished nickel face, black or dead nickel background and japanned iron pot.

ELECTRICAL PATENT RECORD.

LETTERS PATENT ISSUED MAY 30, 1905.

Electric Railways and Appliances.

790,886. Insulated Rail-Joint. Selden S. Deemer, Reading, Pa. Filed Aug. 15, 1904.

790,931. Trolley-Catcher. Lucean B. Stanley, Collinwood O. Filed July 22, 1904.

790,937. Trolley-Wheel. Richard Voltz, Michigan City, Ind., assignor of one-half to Otto Ohming, same place. Filed Feb. 21, 1905.

790,957. Insulating-Support for Third Rails. Ed W. Farnham, Chicago, Ill. Filed June 27, 1904.

791,003. Railway Block-Signal System. Frank E. Button, New York City. Filed Aug. 12 1904.

791,012-013. Strain and Supporting Device for Electric Railways. Harry P. Davis and Theodore Varney, Pittsburg, Pa., assignors to the Westinghouse Electric & Manufacturing Company. Filed Oct. 19, 1904, and Jan. 23, 1905.

791 031. Supporting Structure for Trolley-Wires. Budd J. Jones, Chicago, Ill., assignor to the Westinghouse Electric & Manufacturing Company. Filed April 2, 1904.

791,079. Rail-Clip for Third-Rail Insulators. George L. Courtenay and William Courtenay, New York City. Filed Aug. 27, 1904.

791 082. Trolley-Wire Hanger. Harry P. Davis and Theodore Varney, Pittsburg, Pa., assignors to the Westinghouse Electric & Manufacturing Company. Filed Oct. 19, 1904.

791,086-087. Self-Aligning Bearing and Universal Joint. Isidor Deutsch, Montreal, Canada, assignor to the Electric & Train Lighting Syndicate, Limited, same place. Filed April 30, 1903, and Oct. 24, 1904.

791,091. Brake for Trolley-Wheels. Johan E. Gamalielson, Kaumana, Hawaii. Filed Oct. 8, 1904.

791,178. Trolley-Wire Switch. Joseph T. Bunn, Washington, D. C. Filed Aug. 3, 1904.

791,191. Trolley-Guard. Mathias Hartz, Pittsburg, Pa. Filed Feb. 27, 1904. Renewed Nov. 2, 1904.

791,228. Electric Railway Signal or Alarm. Earl L. Tatum, Washington, D. C., and James W. Tatum Durham, N. C., assignors of one-half to Robert B. Boone and John W. Smith, Durham, N. C. Filed Sept. 2, 1904.

791,279. Trolley. George V. Miller, Irwin, Pa. Filed April 7, 1905.

Electric Lights and Appliances

790,940. Adjustable Suspending Device for Electric Lights. Arthur B. Wass and William Whitaker, Jr., Oakville, Canada. Filed July 14, 1904.

791,020. Extensible Support for Incandescent Lamps. Peter Forg, Somerville, Mass. Filed June 4, 1903.

791,253. Regulating Means for Electric Lamps. Albert G. Davis, Schenectady, N. Y., assignor to the General Electric Company. Filed Sept. 18, 1902.

Electrical Machinery and Apparatus

790,883. Electric Fuse or Cut-Out. Leonard B. Buchanan, Woburn, Mass. Filed March 20, 1905.

790,917. Electrical Measuring-Machine. Franklin J. Perkins, Woburn, Mass., assignor to Vaughn-Rood Machine Company, Portland, Me. Filed Sept. 17, 1903.

790,941-942. Electric-Power System. James E. Weaver, Allegheny, Pa., assignor to the Weaver Electric Fire Engine Company, Pittsburg, Pa. Filed April 27 and Oct. 21, 1904.

790,983. Switch for Electric Circuits. Benjamin P. Rucker, Wilkinsburg, Pa., assignor to the Westinghouse Electric & Manufacturing Company. Filed Oct. 8, 1904.

791,021. Transformer. Charles Le G. Fortesque, Wilkinsburg, Pa., assignor to the Westinghouse Electric & Manufacturing Company. Filed Sept. 30, 1903.

791,085. Thumb-Piece for Electrical Switches. Frank C. De Reamer, Schenectady, N. Y., assignor to the General Electric Company. Filed Dec. 9, 1902.

791,116. Control of Synchronous Machines. John B. Taylor, Schenectady, N. Y., assignor to the General Electric Company. Filed Oct. 17, 1904.

791,124. Controller for Electric Motors George Baehr, McKeesport, Pa., assignor to the National Tube Company, Pittsburg, Pa. Filed Feb 10, 1905.

791,180. Electric Motor for Automobile Vehicles. Eugenio Cantono, Rome Italy, assignor to Giovanni Mazzacorati, New York City. Filed Aug. 11, 1902

791,182. Thermostatic Circuit-Closer. Albert D. Catwood, Chicago, Ill. Filed Aug. 12, 1904.

Telephones and Telephone Apparatus.

790,945. Telephone-Transmitter. Walter L. Wilhelm, Buffalo, N. Y. Filed March 4, 1902.

790,952. Telephone-Mouthpiece Protector. Joseph M. Carrere Allentown, Pa. Filed Sept. 12, 1904.

Miscellaneous.

790,966. Indicator for Signal Transmitters. George W. Lorimer, Piqua, O. Filed July 22, 1902.

790,975. Electric Spark-Gap or Interrupter. Earle L Ovington, Boston, Mass. Filed Feb. 11, 1905.

791,103. Telegraph Key and Switch. Thomas J. McAdams, Annapolis, Mo. Filed May 19, 1904.

791,113. Electric Door-Opening Device. Frank Staehle, Newark, N. J. Filed Feb. 10, 1904.

791,114. Electric Signaling Indicator. Wm. Starkey Chicago, Ill. Filed Feb. 6, 1905.

791,285. Electric Boat or Launch. Harlan Page, Germantown, Pa. Filed March 26, 1904.

791,305. Art of Separating Gold or Other Diamagnetic Metals, Louis T. Weiss, New York City. Filed Aug. 26, 1903.

791,350. Storage Battery. Roderick Macrae, Chicago Ill. Filed Aug. 4, 1904.

791,413. Telegraphic Transmitter. Alfred C. Gilmore Chicago, Ill. assignor to James H. Peirce, truste same place. Filed Jan. 29, 1902.

791,429. Electric Block-Signalling System. William M Murphy, New York City. Filed Aug. 31, 1904.

791,435. Electric Speed-Limiting Device. Bertus 3 Barlow, Manchester, N. H. Filed Dec. 9, 1904

THE TELEPHONE WORLD.

New Company Offers Big Inducements to New York.

An application was made on Friday for a franchise to open war upon the telephone monopoly in this city with 5-cent calls and greatly reduced prices for residence service. The application was one of a half dozen which were laid before the Board of Estimate and Apportionment. It was received and the board set June 30 as the date for a public hearing on it.

The company making the application is the Atlantic Telephone Company. The officers and backers of the concern are almost all out-of-town men. Joshua D. Powers, president of the State Trust Company, of Louisville, Ky., and president of the local telephone company in Louisville, is president. Prominent business men of Pittsburg and other cities are mentioned as being interested in the company.

The promoters said that they had found a demand for 250,000 telephones in the city. "Our idea," it was said by the promoters of the company, "is to popularize the telephone and make it as generally used as gas and water."

The rate announced by the company is 5 cents for outside calls, $66 for residence rate, with unlimited service, and $108 for business office rate with unlimited service.

For compensation to the city the company offers to give the free use of 500 telephones and to pay the city 1 per cent. of the gross receipts for the first two years, 2 per cent. for the next three years, and 4 per cent. for the next 20 years. The franchise asked for is to run 25 years.

The directors of the Rochester, N. Y., Telephone Company will take action soon that will result in the purchase of a controlling interest in the Independent Securities Company of Utica. This will be another step in the forming of a combination of the Independent telephone companies of this State. It is said that the next company to be taken into the combination will be the Syracuse Telephone Company. Recently General Manager F. M. Potter, Jr., said that such was the intention, but that the details had not yet been worked out.

The Market Gardeners' Telephone system of Bloomington, Minn., has been sold to the Fisher system of Shakopee. The Shakopee system, which uses the Northwestern to Fort Snelling and Minneapolis, has been greatly needed by the market gardeners in Bloomington, as it gives them ready communication to the fort and the twin cities.

The Mount Vernon, Wis., Telephone Company has increased its capital from $2,000 to to $10,000. G. G. Stamm, president, and J. S. Donald, secretary.

A complete telephone system, touching all the coal mines of the Pratt City, Ala., division of the Tennessee Company is being installed.

The telephone poles are being set in Floyd Hill, N. Y., and the company promises to have the line in working order on before July 1.

A telephone line has been completed between Paris and Rome, and will soon be in operation between the French and Italian capitals.

Street Telephones for Public Service.

According to a Cincinnati, O., paper, one of the telephone companies of that city is about to try a plan of public service which is in operation in Europe, reaching the highest degree of efficiency in Norway and Sweden. The board of public service has granted the company a right to erect a short iron pole in front of the Traction Building, on which will rest a telephone box, similar in appearance to a fire-alarm box. It will be a public station and is intended to save time for those in a hurry. If the trial proves a convenience to the public, application will be made for other stations in various parts of the city.

Telephone Bids Wanted.

The Secretary of the Interior has issued a call for bids, to be opened June 26, for the construction and completion of a telephone system, about 16 miles in length and having four telephone stations, in connection with the Belle Fourche project, near Belle Fourche, S. D. Specifications, forms of proposals, and particulars may be obtained from the chief engineer of the Reclamation Service, Geological Survey, Washington, D. C., or the engineer in charge of the project, Belle Fourche, S. D. All bids should be addressed to the last mentioned official.

Some time during the present month the chief of the Signal Corps of the United States Army will issue a call for sealed proposals for furnishing the Signal Corps with about $75,000 worth of telephone apparatus. Models of practically all this equipment are now on exhibition in the model room of the Signal Corps in the Lemon Building, Washington, D. C.

The Terril, Ia., Co-operative Telephone Company has bought the telephone system heretofore operated by the Midland Telephone Company, of Milford, and took possession June 1. The officers of the Terril Company are: President, D. A. Daniels; vice-president, T. J. Randolph; secretary; D. E. Neville; treasurer, W C. Edmunds; directors, Martin Adson, David Woods, Ole Pingerson and G. W. Nefzger.

The Mt. Vernon, Me., Telephone Company was lately formed to do a general telephone business in the towns of Mt. Vernon, Readfield, Fayette, Vienna and Rome, in Kennebec County, and Chesterville, New Sharon and Farmington, in Franklin County, with $5,000 capital stock. The officers are: President, C. W. Mansur; treasurer, R. W. Leighton, both of Mt. Vernon.

The certificate of incorporation of the Tracy Creek, N. Y., Telephone Company was lately filed with the county clerk. The company is capitalized at $1,000. The directors are L. A. Mason, George Morton. Alex. Webster, B. C. Plough, Fred Wood, F. D. Brimmer and Oren Knight, all of Tracy Creek.

Congress has passed a bill empowering President Palma to grant at public letting a concession for a long-distance telephone service in Havana, Cuba. A guarantee of $50,000 will be required.

Telephones for Ships.

Two very elaborate telephone systems are being installed on the steamer Dakota, being constructed for the Great Northern Company. One is an exchange of the ordinary private plant type, which places the occupant of each room in communication with 150 other stations in different parts of the boat, and the other is an intercommunicating system which is made use of in the boat's administration. The officers, in making use of the latter do their own switching. It will largely supplant the gong and jingle system and the marine telegraph. It extends between the navigating and the engine room stations.

The stations are the bridge, the after-bridge, the crow's nest, port and starboard engine spaces, wheelhouse, chief engineer's room, chief electrician's room, central electric-lighting station and the dynamo shelf.

The six exposed stations have waterproof instruments. The holding case is of copper. The talking and listening parts are connected, so that all the officer or sailor has to do is to put the receiver to his ear. A great deal of ingenuity has been exercised in the construction of the instruments in such a manner as to exclude the water and moisture of the air.

Under the new order of things, when the lookout, high up in the crow's nest, sights an object on the sea, instead of raising the cry as he did formerly, he will simply open a copper telephone box and transmit the intelligence over the wire.

A Wire Fence 'Phone Line.

News from Stroudsburg, Pa., states that the Sugar Hollow Wire Fence Telephone Line is now in successful operation. Farmers living in the western part of Monroe County built it for their own convenience, and the line extends five miles.

There are a number of 'phones connected, and the farmers are elated over the unique wire fence telephone service. It has no stockholders, no superintendent, no officers of any kind, and everybody is perfectly free to use it, repair it, extend it and prize it as his own.

The Lyon County, Kan., farmers who are interested in the different rural telephone lines, held a recent meeting at the court house for the purpose of organizing the different lines and putting them under one management. The farmers are making a fight for the 50 cent rate granted them by the passage of a law to that effect by the last Legislature, and are combining with a view of obtaining it. The officers elected were: President, George Plumb; vice-president, E. B. Grant; secretary, Richard Spiker; treasurer, W. C. Jones.

A new manufacturing plant is to be established in Gallatin, Tenn., in the near future by J. T. Durham and W. W. Pardue, who will erect a plant for the manufacture of oak, locust and mulberry telephone, telegraph and electric light insulator pins and brackets. The capacity of the plant will be from 8,000 to 10,000 per day.

Telephone service has opened up on the Crews line in Buda, Tex. This company is operating six lines. L. Crews is the owner.

GENERAL ELECTRICAL NEWS.

LIGHTING.

Albany, N. Y.—A certificate of the incorporation of the All-Counties Gas, Electric Lighting, Power, Heating & Illuminating Company, which proposes to carry on operations particularly in the County of Kings, has been filed with the Secretary of State. It has a capital stock of $ 0,000, and its directors are Edwin R. W. Potter, of Flatbush, and Henry E. Gaest and Alfred C. Cooper, of Brooklyn.

Columbus, O.—J. M. Butler, city solicitor, and his first assistant, David Keating, are looking over electric lighting conditions in other cities. This city is now endeavoring to establish a uniform rate for electric lighting and Mr. Butler has the matter in charge, to ascertain methods in vogue.

Del Rio, Tex.—The Del Rio Electric Light & Ice Company, capitalized at $20,000, has been formed by J. G. Darden, of Jericho, and John M. Gray, of this city.

Dexter, N. Y.—The Dexter Electric Light & Power Company has been organized to furnish light and power to various towns and villages in Jefferson County. Its capital stock is $100,000 and directors, Edward Hunter and Catherine J. Hunter, of this place, and Celestin C. Burns and George H. Burns, of Watertown.

Glenwood, Wis.—Plans for a local electric light plant are being prepared.

Higginsville. Mo.—Plans have been completed for the erection of a new electric light plant to cost $28,000, at the Confederate Home in this city.

Livingston, Mont.—This town is about to have a new electric light plant.

Luverne, Ala.—This town will have electric lights not later than October 31.

Lynn, Mass.—A reduction in the price of electricity, announced by the Lynn Gas & Electric Company, is to take effect July 1.

Meredith, N. H.—The Meredith Electric Light Company has filed articles with the Secretary of State increasing its capital to $9,000.

Milwaukee, Wis.—An investigation of discrimination in rates for commercial lighting in this city, was recommended by the council finance committee at a recent meeting.

New Castle, Col.—The Henry Electrical Corporation of Denver has purchased the Peter Kinney electric light plant of this city, and has commenced the work of overhauling the plant and remodeling it along more improved lines. New machinery throughout will be installed.

New York City.—The Murray Hill Public Service Company, of New York, has been incorporated to supply gas and electricity. Its capital stock is $10,000. James Cremmins, of Pelham Manor; J. W. Roche, of Pelham Heights, and L. C. Cremmins, of this city, are the directors.

Potsdam, N. Y.—The Raquette Valley Electric Light & Power Company, capitalized at $5,000, has been incorporated by George E. Willmarth, Lewis C. F. Hall, Henry H. N. Baker, John F. Butler and Frank E. Timerman, all of this place.

Rock Island, Ill.—The Home Electric Light & Power Company of this city, with a capital of $10,000, has been incorporated by Robert W. Olmstead, R. S. Dart and others,

Sturgeon, Mo.—The $5,000 electric ligh bonds, issued by this city, were sold to ex-Governor Lon V. Stephens, of St. Louis.

Tallapoosa, Ga.—Messrs. Gelder and Black will erect a thoroughly up-to-date electric light plant here.

Upton, Mass.—The question of electric lights is being agitated here.

Warren, Ark.—The Warren Light & Water Company has been chartered for the purpose of erecting an electric light and power plant. Its capital stock is $20,000, and officers, Fred L. Purcell, president; W. J. Savage, vice-president.

STREET RAILWAYS.

Abilene, Kan.—Plans to build an electric railway line from this city to Fairbury, Neb., to take in Clay Center and Washington, are almost completed by capitalists here. It will be called the Golden Belt Electric Line, and a charter will be secured shortly.

Ashland, Neb.—The Omaha, Lincoln & Beatrice Railway Company will establish an electric line through this city as soon as a right-of-way can be secured.

Atlanta, Ga.—This city is fast becoming the great electric railway center of the South, and it is promised in the near future six long-distance trolley lines, connecting with important points within the State, and even beyond its borders.

Auburn, N. Y.—The Auburn & Northern Electric Railroad Company, which proposes to construct a line about 12 miles long from this city to Port Byron, was lately granted by the State Railroad Commission rights to issue a first mortgage for $1,000,000, under which but $500,000 bonds can be issued at this time, and before issuing the remainder the company must apply to the State Board for its consent.

Barberton, O.—The Barberton, Wadsworth & Western Traction Company will build its own power house here.

Corbin, Ky.—A charter will be asked for the Jellico Electric Railway Company, which proposes to connect Jellico, Newcombe and this place, by an electric road.

Hannibal, Mo.—An electric road is to be built from here to Quincy as soon as possible.

Harrisburg, Pa.—It will not be long before Lancaster and this city will be connected by trolley line.

Jackson, Mich.—A party of Eastern capitalists, including Charles B. Holt, of New York; H. L. Randall of New Milford, Conn.; Charles Barlow, of New Haven; E. H. Spaulding, of New London, and Abram Paradise, of Brooklyn, have decided to finance a trolley line to be built between this city and Adrian. The new line will connect at Adrian with the Toledo & Western. The Adrian-Jackson line will be operated in conjunction with other lines, so as to allow through cars from Toledo to Lansing.

Powersville, Ia.—A new electric railway is to be constructed here.

Seattle, Wash.—Half a dozen projects for electric lines in different parts of this State, several of them paralleling steam roads, are now occupying a considerable part of the public mind.

Seymour, Ind.—John M. Duryee and Allen T. Russell, of Chicago, representing capitalists that city, are interested in the proposed electric railway line between this city and Columbus.

Tacoma, Wash.—Isaac W. Anderson, of this city, with several Walla Walla business men, have incorporated the Walla Walla Traction Company, with $200,000 capital, to build and operate a street railway in Walla Walla, which now has no street railway facilities.

Vallejo, Cal.—Prospects are said to be excellent for an early start on the work of building an electric rairoad between this city, Benicia, Suisun and Vacaville over the route of the franchises held by J. W. Hartzell. C. F. Archer, representative of the banking house of E. H. Rollins & Sons, has inspected the route and the resources of the country.

White Plains, N. Y.—The Harlem Railroad Company intends to begin the work immediately of transforming its system from Mott Haven to Wakefield into a four-track electric system. It is proposed to make Wakefield the terminal of the road until the line from that station through Mount Vernon, Bronxville, Tuckahoe, Hartsdale, Scarsdale and this place, has been prepared for the electric system.

POWER PLANTS.

Rhinelander, Wis.—The Rhinelander Power Company, composed largely of local parties, has completed arrangements to develop the water power of the Wisconsin River at a point about six miles below this city. A dam will be built, giving a head of about 24 feet and sufficient water is obtainable to develop an average of about 600 hp. In the rainy season more than 2,000 hp., at a conservative estimate, is obtainable.

Weleetka, I. T.—It is estimated that the construction of the power plant to be erected here, will cost not less than $1,500,000.

BIDS WANTED.

Kearny, N. J.—The common council has instructed T. C. Wildman, town clerk, to advertise for bids under plans and specifications adopted by that body for the erection of a municipal electric lighting plant. It is estimated that the plant will cost about $55,000. Bids for the construction work will be opened at a meeting to be held June 14. Plans for the structure are now on file at the town clerk's office and also at the architect's office.

Washington, D. C.—The Bureau of Supplies and Accounts, Navy Department, is inviting sealed proposals until June 13 for furnishing Eastern Navy Yards with the following supplies: Schedule 275, electrical supplies, wire, cable, incandescent lamps; schedule 277, telephones, electric elevator. Blank proposals can be obtained of the Bureau, or of the Navy pay office in New York.—Sealed proposals are being invited until June 14, for furnishing electric light fixtures for the House and Senate wings of the United States Capitol. Address Elliott Woods, superintendent, for blank proposals.—The War Department, through the office of the chief engineer, is inviting sealed proposals until June 20, for furnishing and delivering 36-inch searchlight outfits. Major S. W. Roessler will furnish proposal blanks on application.

NOTES FCR INVESTORS.

Latest quotations for copper are: Electrolytic, 15⅛@15¼c.; Lake 15⅛@15¼c.; casting, 14⅞@15c.

The trustees of the Massachusetts Electric Companies voted to postpone action regarding the declaration of a dividend upon the preferred stock.

The Chicago City Railway Company has declared the regular quarterly dividend of 2½ per cent., payable June 30. Books close June 12 and reopen June 19.

The Broadway (New York) Surface Railroad second mortgage bonds, which mature July 1 next, will be paid on and after that date by the Morton Trust Company.

The Allis-Chalmers-Bullock Company of Montreal has obtained the contract to install a complete lighting plant for the town of Calgary, in the Canadian Northwest.

Superintendent Hedley, of the Interborough Rapid Transit Company of New York, says that the Bronx section of the Subway would be opened on the morning of June 15 without fail.

George W. Ely, secretary of the New York Stock Exchange, has received official notice of the Twin City Rapid Transit Company's proposal to increase its common stock by $5,000,000.

The regular quarterly rental of 1¾ per cent. on the stock of the Metropolitan Street Railway Company of New York will be paid July 15. Books close June 24 and reopen July 17.

The Woburn, Mass., City Council has passed over the Mayor's veto an order transferring the franchise of the Woburn Light, Heat & Power Company to the Edison Electric Illuminating Company.

According to a table prepared by Comptroller Grout the city of New York should receive for back franchise taxes and interest, 1900 to 1904 inclusive, as result of the franchise tax decision, $24,008,863.

Cleveland capitalists owning the New York & Long Island Traction Company, operating 34 miles of track connecting with the Brooklyn Rapid Transit Company, have sold the property for $1,450,000 cash.

A dispatch from Easton, Md., says the Diamond State Telephone Company and five other companies which have just voted to merge with it, are to be sold to the Bell Telephone Company of Philadelphia. The stockholders will meet June 30 to ratify the contract of the sale.

The directors of the United Railways & Electric Company of Baltimore have voted to pay no June interest on the income bonds, in view of the heavy expenditures for improvements. The last three coupons are unpaid. They are cumulative and back interest due amounts to $840,000.

It is reported that a settlement has actually been made with minority holders of $1,000,000 of the bonds of the Philadelphia & Lehigh Valley (Pa.) Traction Company on a cash basis of 45 for the bonds, and that they have been bought in for the reorganization committee of the Lehigh Valley Traction Company.

Judge Lanning, in the United States Court at Trenton, N. J., has directed E. C. Foster, receiver of the New Orleans Railway Company, to sell it to-morrow, unless there is paid to the New York Trust Company $22,557,324 for the bondholders. The receiver is to accept no bid amounting to less than $10,000,000.

NORTON SWITCHBOARD INSTRUMENTS.

Style "C" in Ranges:

0 to 5 volts.
0 to 750 volts.
0 to 10 amperes.
0 to 1500 amperes.

Dead Beat and made for either Back or Front Connections.

The Norton Electrical Instrument Company,

Main Office and Factorv, Railroad Avenue, MANCHESTER, CONN.

ESTABLISHED 1857.

The Wallace Barnes Company,

BRISTOL, CONN., U. S. A.,

Manufacturers of **SMALL SPRINGS** of every description. Dealers in **WIRE** and **COLD ROLLED STEEL** full of life and even temper.

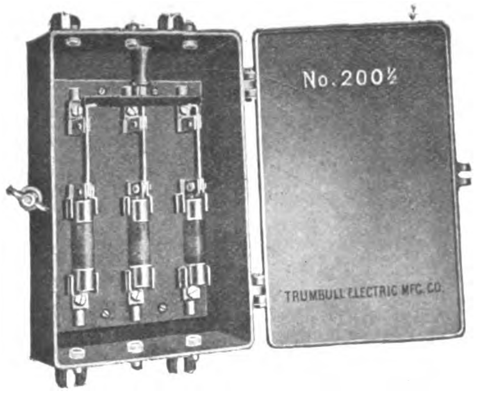
Catalogue and stock sheet mailed upon application.

"Manross" Hair Springs

For Electric Indicating and Recording Gauges, Steam Gauges, etc

Largest Manufacturer of Hair Springs in the United States.

F. N. MANROSS, Forestville, Conn.



You often have jobs where it is necessary or desirable that your service switch and cutout should be protected from dampness, corrosive fumes, or mechanical injury. This is accomplished most easily and inexpensively with a Trumbull Iron Service Box. Everything considered the box will be found cheaper to use than a wooden box lined with sheet iron, and being made of iron it is damp proof, dust proof, fire proof and indestructible, which the wooden box is not. The box is furnished with bushings, or drilled for iron pipe of any size, as desired. Made in five sizes for service from 15 to 300 amperes. The switch is constructed to open back over the fuses, allowing the door to be closed when the switch is open. Altogether, it is the most satisfactory service box made, and can be used safely anywhere. Send for booklet "C" which gives more complete information, and quotes prices. Yours for a postal.

EDITORIAL NOTES.

New York to Chicago in Ten Hours.

Distance is now another name for time. A keen competition between railroad companies has raised the standard of excellence in rolling stock. The locomotive has been improved and the roadbed strengthened. Distance is being annihilated. Progress has been so rapid in the last ten years that even the most impatient hold their breath in surprise. Stephenson's venture has become a gigantic industry. It has transformed the dry land into the equivalent of great waterways. The freight of the country seeks the railroad; the farmers and the public regard it as their highway. Not only between small towns does this feeling exist but between the largest and most populous of our cities. From New York to Chicago was once considered a serious journey. In provincial days dangers beset the traveler on every side. Days were consumed in covering the distance. Now it is but a question of hours. Shall it be called the ultimate triumph of steam? Or shall we inquire as to what this ultimate triumph must be?

The distance is roughly 1,000 miles between New York and Chicago. About 29 hours, cut down to 24, was the customary limit of time in covering it. A speed of 40 miles an hour averaged up along the route. This, during the Columbian Exposition, was considered splendid railroading. Since then the locomotive has undergone great changes. The well-fortified roadbed, connecting that city and ours, invited a higher speed. A 50-mile an hour rate then presented the average. The latest reports show a capacity on the part of the Pennsylvania and New York Central to regularly operate an 18-hour train. This means an average speed of over 55 miles an hour. Now comes the question again, Is this the ultimate triumph? We think not. The locomotive can spin along much faster than this. Speed must be made subservient to the conditions of the road—whether it is clear or not, whether it can stand the rapid pounding of this great engine or whether it is safe to hurry forward so impetuously.

The suggestion is presented here that electric traction has set a new standard. The New York Central will use electric locomotives of 2,200 rated horse power. A speed of 90 miles an hour is easily attainable with a train of cars. Divide 1,000 by 90 and what is the result? A little over 11 hours. These are not merely figures, they are facts. The electric locomotives have been tested and tried. The system works like a charm. It would take a great deal of audacity to say when Chicago and New York will be the termini of an electric express system, but it is impossible to be blind to the truth. Ten hours to Chicago from New York is not so far off after all. Perhaps none have recognized this fact more readily than those from whom these results are to be expected—the steam railroad companies themselves.

* * *

The Peat Industry.

In view of the fact that coal is becoming scarcer and consequently higher in price each year, and that the time may come when other means of generating power will have to be sought for, a few words regarding the peat industry in this country will not be amiss.

As yet this industry is in its infancy. A few small operations are now going on, however, and a great number of prospective schemes are being exploited.

Several companies have been organized in the Middle and Northwestern States to produce peat fuel by various methods.

Some of these are building plants to operate during the summer of 1905. Others do not seem to have advanced beyond the prospectus stage. Many of them promise extraordinary profits by the use of patented processes, often involving the use at some stage of electrical devices.

Besides various plants in Canada and Mexico, mention is made of certain plants in the United States. The Pompton Fuel Developing Company is producing machine peat near Lincoln Park, N. J., and sells all its product to local consumers. Its success on a small scale will probably result in building a much larger plant this year. The machinery in use was imported from Germany and includes a Dolberg breaker and mixer. This company controls a large acreage of peat land in the vicinity of Pompton Plains, N. J. Another plant is in operation near New Rochelle, N. Y., by the Peat Koal Company of New York, which uses a Schlickeysen machine. At Orlando, Fla., machine peat is manufactured on a machine designed by Mr. T. H. Leavitt of Boston. A company has been organized in California to manufacture briquettes composed of peat and oil. Some tons of fuel have been made and tested, both for domestic and steam-raising purposes.

* * *

Marconigrams Between Express Trains.

One of the most interesting features of the twentieth century is its surprises. Take it as you will, we are always guessing as to the next move in the scientific or political world. The latest fact come to light is the equipment of trains between St. Louis and Chicago with "wireless" outfits. The Alton route has made a series of experiments in the past, which have culminated with such success that it is expected the company's efforts will lead to the establishment of a permanent system of this character on all express lines. The influence of this application of "wireless" to train service must not only be estimated with regard to the advantage to the passenger; it must be considered in connection with other important matters as well. The passenger, of course, can transact his business on the train if he chooses, remaining in touch with his office force however fast the train is moving all the way out. This is a great advantage to our captains of industry, whose souls are torn with doubt between stations when important affairs are in progress. But perhaps the best application of this splendid invention is that which is devoted to the protection of the passenger himself. This is where the greatest good may be done. It is easy to see how safe high-speed trains would become if some means were provided by which emphatic signals are rung when they approach within a few miles of each other. The casualties of steam roads are fresh in our minds. England has always protected herself in one particular respect by refusing to allow roads to cross each other on the same level—one goes above and the other below. Accidents are very rare in consequence. But American jurisdiction is not uniform. One State permits what another refuses. For this reason accidents are almost inevitable unless the greatest foresight is employed, particularly where freight lines and passenger trains occupy the same sections of track.

Let the "wireless" become as practical in its application as reports indicate and all locomotives will be equipped. The terrible loss of life and bodily injury resulting from collisions would thereby be reduced to a minimum. This mysterious signal from around a curve in the road, from a train delayed a few miles ahead, or from one behind rushing forward at a higher speed would be like a guardian angel in its watchfulness. There are few inventions that hold out such promise as this, few in fact that possess the merit to meet a dangerous situation so promptly. The increasing activity in our commercial centers has made time of the greatest possible value and led to head-long speeds on our trunk lines, but what business man would feel justified in running a life risk unless such provision were made on the journey that every element of chance is reduced to a minimum. An automatic signaling device, operative by a near-by train, would effectively solve this great problem. The blessed era of wireless telegraphy is only beginning.

UNDER THE SEARCHLIGHT.

Notes and Comments on Various Topics.

New York City will probably be selected as the place for holding the next convention of the National Electric Light Association.

◆

A 48-inch water main burst Sunday afternoon at Park avenue between 41st and 42d streets, New York, and sent torrents of water into the Subway beneath. It was necessary to shut off the power, stopping traffic for over 24 hours.

◆

The following appointments have been made for Cornell University at Ithaca, N. Y.: Mr. G. S. Macomber, assistant professor of electrical engineering; Mr. A. M. Buck, Jr., instructor in electrical engineering, and Mr. H. H. Cochrane, instructor in experimental electrical engineering.

◆

The Liege International Exhibition in Belgium was recently opened under the auspices of King Leopold.

◆

There are fourteen establishments in the State of Michigan for the manufacturing of electrical machinery, apparatus and supplies with a combined capital of $413,732.

◆

The Pennsylvania Railroad Company has begun the construction of the first experimental electrical engine at its Juniata shops at Altoona. If it proves satisfactory it will be used on the company's New York subways and Long Island connections.

◆

To demonstrate how little danger there is in electrical force when properly handled, Prof. Elihu Thomson of Lynn, Mass., permitted a half-million volts to pass through his body Thursday. He did not display the slightest tremor or experience any physical discomfort from the test. Prof. Thomson used a special apparatus in making the test. When the current was turned on, there was a flash from the finger tips and great sparks flew into the air, illuminating two incandescent lights that were held two feet from the fingers.

◆

The capital invested in electric lines in the United States, including street railways is $2,127,634,000.

◆

Last week, Thursday, for the first time in the history of railroading, wireless telegraph messages were successfully transmitted to and from an express train that was running at a rate of 50 miles an hour. The test was made on the Chicago & Alton Railway, between Chicago and St. Louis, messages being sent from Chicago to officers of the road traveling on the train, and every telegram was successfully transmitted. The observation car on the train was equipped with wireless apparatus, and while running nearly a mile a minute messages were received from President Felton, who was in the general offices in Chicago, and replies sent back from the train without the slightest hitch. So successful was the experiment that it was decided to equip at once all Alton trains running between Chicago and St. Louis with the wireless apparatus.

PROCEEDINGS OF THE NATIONAL ELECTRIC LIGHT ASSOCIATION CONVENTION AT DENVER, COL.

The Denver-Colorado Springs convention of the National Electric Light Association was a great success, and our representative writes that the large attendance—over 1,300—surprised the old-timers.

The first session of the convention was called to order at 10 A.M. Tuesday, June 6, at the Brown Palace Hotel, Denver, by President Davis, who said:

Gentlemen—The 28th convention of the National Electric Light Association will please come to order. I have the honor of introducing the Hon. Robert W. Speer, the Mayor of the City of Denver, who will deliver an address of welcome.

Mayor Speer's welcome to the convention made a happy impression. The mayor concluded his address as follows:

"In behalf of the men and women of this city, I want to extend to you the hand of hospitality, the freedom of our city; good wishes, and kind thoughts for your comfort and happiness while here and for a longing to return when you go away. Gentlemen, Denver is your—the gate is now wide open; walk in and help yourselves." (Applause).

President Davis—Gentlemen, I am sure we all appreciate the hearty welcome extended to us by Mr. Speer. The good things he said about Denver in his address are some of the reasons which induced us to select Denver as our place of meeting. We thought it would be a good idea and be an education for many of our members to come West, and after listening to the eloquent remarks of the Mayor and anticipating the pleasant experiences we will have during our stay in Colorado, I am sure we have made no mistake in selecting Denver-Colorado Springs as our place of meeting. I wish to thank Mayor Speer, on behalf of the Association, for his address of welcome.

President Davis then read his address which was in part as follows:

ADDRESS OF PRESIDENT.

"For the first time in the history of the National Electric Light Association, its annual convention will be held west of the Missouri River, and no more typical city of the West could have been selected than the progressive municipality of Denver, and no more beautiful spot than Colorado Springs.

"The interest of the central station, considered as an industry, is what has lately received the best work and thought of your association; the vital questions being no longer pre-eminently those of management or type of plant, but rather those relating to the stability and legitimate earning power of the industry.

"The one great and constant menace to the industry is unwise, burdensome and restrictive legislation by the municipality and the State. The right to tax is the power to destroy. The power to regulate contains the germ of the danger of confiscation in whole or in part. The regulation of the industry by a commission with powers such as are vested in the Gas and Electric Commission of the State of Massachusetts, may be proper and satisfactory as safeguarding both the rights of the public and of the investor. But regulation by a commission brought into being by a manufactured public sentiment, and having its inception in politics and not primarily or honestly intended to remedy any admitted public oppression, or to properly regulate the use of public franchises, cannot be fair either to the public or to the investor and must result in gross injustice to the industry.

"The association should not be passive while laws placing the industry under the regulation of commissions are passed by the several States, without making proper suggestions whereby such laws would be made reasonable and uniform in their provisions. Nor should it permit, without protest, the passage of any laws admittedly unduly restrictive and burdensome. The object should be to have the general laws of the several States relating to the industry conform to some standard, both fair to the public and to the industry.

"For one State to grant only very limited term franchises under burdensome restrictions, and for another—and possibly an adjoining State—to grant perpetual franchises without restrictions; for one State to reserve the right to fix and change the rate of charge for service rendered, and for another State to empower any municipality to make any rate it may see fit, and to charge the same when, and as it pleases, cannot but injuriously affect the stability of the industry from the standpoint of the investing public. I would, therefore, recommend the appointment of a standing committee on legislation to aid in protecting the interests of our members should occasion arise.

"Another important question is that of municipal ownership, which, while as yet limited generally to the construction and operation of municipalities of plants for public lighting, is more than likely to result in the general attempt to engage in private or commercial lighting, in aid of the public lighting.

"By way of self-protection, the central station should more than live up to the obligation of its franchises; should furnish public lighting at reasonable prices, and serve the public so well that any agitation started for political or personal ends will not receive the support of a justly indignant public.

"As the basis of the argument in favor of municipal ownership is largely that of a reduction in the cost of public lighting to the taxpayer, we should be prepared to answer this claim—as can be done—by the concrete results of the operations of existing municipally operated plants.

"It is to be regretted that the League of American Municipalities have not accepted the proposition repeatedly made by the National Electric Light Association to join in a thorough and impartial investigation of the results of the operations of existing electric lighting municipal plants in this country. We know, but the public generally do not, that such results do not justify or support even a part of the claims made by the advocates of municipal ownership.

"The amendments to the by-laws adopted at the last convention, relating to various classes of members, have resulted in a satisfactory addition to our membership. Members, Class B, are officers or employes of member companies, and now number 117; members, Class C, are instructors and teachers of engineering and related sciences, and now number 39, and associate members, Class E, are officers or employes of associate member companies, and now number 68. The total membership is now 824 as compared with 583 one year ago.

"The Association of Licensed Manufacturers of Incandescent Lamps has appropriated the sum of $10,000 for the purpose of effectively co-operating with the central lighting stations of the country for the increased use and, in consequence sale of incandescent lamps. The plan contemplates its expenditure in two ways: First, to be helpful in stimulating central stations along advertising and new business lines; second, to assume the cost of preparation of an effectual and comprehensive plan of advertising and soliciting, which, in consequence, could be furnished by some central bureau or advertising agency at a very low cost. As the plan suggested would be of value to the central station industry, I would recommend that a committee be appointed to work in conjunction with the Association of Licensed Manufacturers of Incandescent Lamps.

"A committee should be appointed to consider and report on the proper method of grounding secondaries of alternating current distributing systems so as to minimize the risk and danger to property and life.

"While not strictly within the objects of the Association, it would be well for our members to consider the advisability of consolidating the street railways, gas and electric companies in any given locality, as not only would the public be better served, but the total investment would be more stable, and the results equally satisfactory.

"But few of us appreciate the tremendous power of the association; the great possibilities for good or evil, that rest in the direction of its policy, and the importance of the interests involved. Our relations to the great public, our customers; to the legislative power, to which we are all subject; to the municipality under whose franchises we operate; to the great manufacturers of apparatus and supplies; to the insurance interests with whom we must always maintain the most intimate relations; and last, but by no means least, to our stockholders and all others pecuniarily interested in the properties we manage, are the great and vital questions that are now uppermost. It will be for future administrations to deal wisely and conservatively with them."

The Secretary announced the following committee on the President's address: L. A. Ferguson, F. W. Frueauff, George R. Stetson, Samuel Scovil and S. T. Carnes.

The President—We will now receive the report of the Progress Committee, Mr. T. C. Martin, of New York, editor. Mr. Martin will also read the special report on the Tantalum lamp, prepared by Dr. Louis Bell, of Boston.

Mr. Martin—Mr. President and gentlemen, as my report as chairman of the Committee of Progress is in type, it seems hardly necessary to inflict upon you an exhibit of bad elocution. I would like merely to call your attention to the various heads of the paper and leave you to read it at your leisure. The statistics of the industry, as usual, are first considered, and one or two aspects of the growth of our industry in this country are briefly referred to. Emphasis is laid particularly by your committee on the cultivation of the small customer, suggesting that perhaps a little less effort be made in the direction of crowding out the isolated plant, and a little more energy be displayed in the cultivation of the small consumer. . . . My paper then considers some of the leading central station developments during the past year, and speaks particularly of such instances as Detroit, where Mr. Dow, our fellow member, is carrying out an extremely interesting and ingenious development. As Mr. Dow is here it will be interesting to have him develop and extend the information given in my brief notes on this subject. I then give consideration to the subject of old and new illuminants which I need not inflict upon you, except to refer to the fact that immediately after the presentation of this report I shall read Dr. Louis Bell's report on the Tantalum lamp. I give in my paper some scientific data in regard to the development and purpose of the lamp, but Dr. Bell's paper is vastly more practicable and vital. After treating of illuminants I go to the discussion of electric heating and follow that up with a few remarks on electric power in general and its special application to refrigeration.

Mr. Martin then presented the report of Dr. Bell.

President Davis—This paper is now open for discussion.

Mr. Arthur Williams, New York.—I think, Mr. President, the life of the Tantalum lamp has been too limited to enable us to have had any commercial experience with it. We have had a number on test, and these tests and reports of other tests, including the report we have just heard through Mr. Martin, promise I think a very marked improvement in the economy of incandescent lamps in the future. I am of the opinion that it makes very little difference to the consumer whether he buys part of his light in current and part in lamps, or all in current, and that with this lamp remaining at the present high price, $1 in Germany and perhaps $1.50 or $2 here, at present it will not be a serious competitor with the incandescent lamp as we now know it. As an illuminant it is certainly very interesting, and promises well for the future, but as there probably have not been more that 100 of these lamps in this country, and they have not been here long enough to be subjected to any kind of commercial tests I do not think it would be practicable to discuss the lamp in any commercial sense. I do not think, because of the high price at which the lamp is obtainable, that it will be immediately a competitor with the ordinary incandescent lamp, because a high lamp cost will make up, in the economy of the lamp, compared with the standard we now have.

The paper was also discussed by John F. Gilchrist, D. C. Farrand, W. H. Gardener, Jr., and A. C. Dunham.

President Davis then announced the following papers:

"The Paramount Importance of the Selection of Standard in Preference to Special Machinery," David Hall, Cincinnati. [Mr. Hall's paper is printed in full in this issue of ELECTRICITY.]

"Insulation Testing—Apparatus and Methods," C. E. Skinner, Pittsburg, Pa.

Mr. Hall's paper was discussed by several members and the convention adjourned until afternoon.

TUESDAY, JUNE 6—AFTERNOON SESSION.

President Davis called the convention to order at 2:30 o'clock and in rapid order the following papers and report were read:

"Automatic Synchronizing of Generators and Rotaries for Lighting and Power Systems," Paul MacGahan, Pittsburg, Pa.

"Notes on Rotary Converters and Motor Generators for Lighting and Power Systems," Louis E. Bogen, Cincinnati, O.

"The Organization of Working Forces in Large Power Houses," W. P. Hancock, Boston, Mass.

"Operating Features of the Curtis Steam Turbine," A. H. Kruesi, Schenectady, N. Y.

Report of Committee on Steam Turbines, W. C. L. Eglin, Chairman, Philadelphia, Pa.

A lengthy discussion followed the reading of Mr. Bogen and Mr. Hancock's papers and the convention adjourned until Wednesday morning.

WEDNESDAY, JUNE 7—MORNING SESSION.

The convention was called to order at 10 o'clock by President Davis and he requested that the two following papers be read:

"Series Alternating Current Motors for Industrial Work," Clarence Renshaw, Pittsburg.

"A New Type of Single-Phase Motors for Elevator Work," S. Percy Cole, St. Louis, Mo.

A joint discussion took place on both papers. Mr. Cole asked whether a 60-cycle motor could be wound for the same voltage as a 25-cycle motor, or for any voltage up to 600, and Mr. Renshaw in reply stated that the question is largely one of the size of the commutator bars required. The higher frequency requires a greater number of bars, making a mechanical difficulty in constructing the smallller sizes.

Other papers and reports submitted at this session were as follows:

"Long Distance High-Tension Transmission in California," John A. Britton, San Francisco.

Report, Present Methods of Protection from Lightning and other Static Disturbances, Alex Dow, Detroit, Mich.

Mr. Dow recommended that the association appoint a reporter to handle the subject.

"The Choice of an Insulated Cable," Wallace S. Clark, Schenectady, N. Y.

"The Nernst Lamp—Its Present Performance and Commercial Status," E. R. Roberts, Pittsburg.

In reply to a question Mr. Roberts stated that the tests on direct current lamps recently showed such favorable results that the company will distribute lamps for commercial tests by various central stations, and the results of these tests will determine whether these lamps will be marketed.

Mr. Arthur Williams said that he had discovered that the Nernst lamp did not materially interfere with the incandescent or the arc lamp, but fills a gap.

The convention then adjourned until 8 P. M.

WEDNESDAY, JUNE 7—EVENING SESSION.

The President rapped for order at 8 o'clock and called for reading the following papers and reports:

"Some Investigations of Induction Losses," E. P. Dillon, Colorado Springs, Col.

"Mercury Arc Rectifiers, P. D. Wagoner, Schenectady, N. Y.

The author of the paper gave a practical demonstration of the apparatus.

"Free Signs and Flat Rates," C. W. Lee, Newark, N. J.

Report, Advertising Methods, Percy Ingalls, Newark, N. J.

Report, Sign and Decorative Lighting, La Rue Vredenburgh, Boston, Mass.

Mr. John Craig Hammond, the well-known advertising manager for the Denver Gas & Electric Company, in the discussion brought forward many good advertising points, and was followed in the same way by Messrs. Ingalls, Hewitt, Lee, Rawlins, McCabe and Williams.

An amendment to the by-laws was presented by Mr. Scovil, making the retiring presidents members of the executive committee for one year after the expiration of their term. The President referred the matter to a committee composed of Messrs. Doherty, Hartman and Brice, and adjourned the convention until Thursday morning.

THURSDAY, JUNE 8—MORNING SESSION.

President Davis called the meeting to order at 10:05 o'clock, and said "I will ask Mr. Crouse to open the discussion this morning on the question of advertising."

Mr. J. Robert Crouse—The thing which I wish to present to this association is perhaps a little different from the papers which have been presented and which have been discussed. I have prepared a paper which is 17 pages long, but I will simply say that the advertising proposition involves the co-operative publicity by the manufacturers of electrical apparatus and supply, co-operating directly with middle men of all sorts, middle men being understood to include central stations, dealers and contractors. I undertake in the paper to justify the proposition which I present. The proposition would involve, if carried out as I suggest, the expenditure of about $287,000 by the manufacturers of apparatus and supplies. As one gentleman said, that sounds well and is a good thing if it works.

The subject of advertising was discussed thoroughly, a large number of members joining in the discussion.

The convention then adjoined until 2:30 o'clock.

THURSDAY, JUNE 8—AFTERNOON SESSION.

President Davis called the meeting to order at 2:30 o'clock. He said: "The first business will be the reception of the report on 'Wrinkles' by Mr. H. C. Abell, New York City. I thank Mr. Abell personally, and I believe all the members of the association will join with me, for the satisfactory manner in which his duties have been discharged and the report prepared.

The next business was the report on "Committee on District Heating," by W. H. Blood, Jr. of Seattle, Wash., chairman. Mr. Blood read the report.

The convention unanimously adopted Mr. Scovil's amendment to the by-laws, introduced in Wednesday's session.

President Davis—We will now hear the report of the Committee on Nominations.

Mr. Louis A. Ferguson—Mr. President, the Committee on Nominations desires to make the following report:

The New Officers.

For President—W. H. Blood, Jr. Seattle, Wash.

First Vice-President—Arthur Williams, New York.

Second Vice-President—Dudley C. Farrand, Newark, N. J.

For three members of the Executive Committee to serve three years—Charles L. Edgar, Boston; John Martin, San Francisco; Frank W. Frueauff, Denver.

President Davis—Gentlemen, you have heard the report of the Committee on Nominations; what is your pleasure.

Mr. H. C. Abell—I move that the Secretary be empowered to cast the ballot of the members present for the unanimous election of the members nominated.

The Secretary cast the ballot and the President declared the nominees elected.

Mr. Ferguson—I would move that the Executive Committee be recommended to select as the Secretary-Treasurer Mr. W. C. L. Eglin, of Philadelphia.

The motion was seconded and carried.

President Davis—Gentlemen, I have pleasure in presenting to you Mr. Blood, your new President. I can only bespeak for him the same kind consideration that has been accorded me. I believe he will receive during his administration the hearty support of all our members.

Mr. W. H. Blood, Jr.—Mr. President and gentlemen, they say that there is no State in the country like Colorado for having the lightning come out of a clear sky. It certainly came out of a clear sky when it struck me this time. This honor is entirely unexpected and I hardly know what to say. I appreciate it very highly. I realize my own shortcomings, and also realize that the only way I can make any success in holding such a high office in this association is by your hearty co-operation, and I ask that I may receive from you the hearty co-operation which you have given to your President in the past.

The Committee on the President's Address then reported, and the suggestions made were adopted by a rising vote.

The usual resolutions of thanks were presented and unanimously adopted, after which the convention adjourned.

At the executive session on Thursday afternoon the following business was transacted:

Report, Committee on Relations with Kindred Organizations, James I. Ayer, Chairman, Boston.

Report of Preliminary Draft of Committee on Rates and Costs, Charles L. Edgar, Chairman, Boston.

Report, Municipal Ownership, Arthur Williams, New York City.

Report of Committee on Standard Rules for Electrical Construction and Operation, Charles L. Edgar, Chairman.

Stevens Institute of Technology Commencement.

The Stevens Institute of Technology announces that the 33d annual commencement exercises will be held Thursday morning, June 22, at 10:30 oclock, in the Auditorium, Stevens Institute, Hoboken, N. J.

THE PARAMOUNT IMPORTANCE OF THE SELECTION OF STANDARD IN PREFERENCE TO SPECIAL MACHINERY.*

BY DAVID HALL.

The idea of this paper is to call your attention to the important advantages, to both purchaser and manufacturer, in the use of standard, in preference to special, machinery. This is not a case in which the manufacturer alone is benefited; the points of advantage are mutual. The purchaser in selecting standard machinery aids the manufacturer in producing a more efficient and more perfect machine at a lower cost.

The most successful power plants must be characterized by reliability and economy of operation. There must be machinery sufficient to meet all emergencies and the machinery should be of as simple construction as possible, as simplicity is the key to reliability and complications insure troubles. The experimental stages of machinery of all kinds are examples of how complicated apparatus can be made, while its ultimate success depends upon the eradication and simplification of the parts so that the machine as a whole is easily understood and easily operated. With the advent of a new machine, we say "how complicated"; when the same machine is perfected, we say "how simple." It is therefore to the advantage of the purchaser that machinery become standardized. If only one machine is built from each design, and we have an infinite number of designs, the result is an infinite number of experiments, and it is only after one of these machines is thoroughly tried and perfected that we have a machine which can be called standard. However, if we assume that no two machines that are purchased are to be alike, there would be no incentive for standardization. This paper refers to "standard machinery" as machinery that is regularly listed for sale by a reputable company, such machinery having been built and standardized. The first machine of almost any description is capable of being improved upon. Sometimes the improvements suggest themselves after a very short test, while other improvements may be made only after a long period of operation. In fact, it may be said that the longer a machine of a given type is operated, the more certainly can the good points be determined and the more pronounced are the bad features that are to be overcome. Consequently, it is positive that the purchaser has everything to gain, in so far as the operation is concerned, by selecting machinery that is standard and does not possess experimental features.

It is to the interest of the purchaser and operator of every machine to know that spare parts can be readily obtained, for in the operation of machinery in general there are certain to be requirements for new parts, made necessary on account of wear or accident, and it is usual that such parts are wanted on short notice. If the machine is standard, such parts are likely to be found in stock, or, at any rate, can be furnished quickly. On the other hand, if the machine is of special construction in part or throughout, there is great probability of delay, and such delay may be very expensive as well as annoying, in fact, a long delay may cost more than the machine is worth.

In the natural course of events in the operation of mills, factories and power plants, changes of help are continually taking place and there is no machine so simple that the experienced operator cannot produce better results with it than can the inexperienced. It is, therefore, of importance that machinery be of such a nature that it can be easily operated, and this point must not be overlooked in making machinery standard. The more machines there are in operation of a given kind, the more men there must be who are familiar with operating them, and consequently the easier it must be to obtain an experienced operator.

Delivery of machinery is usually second in importance only to price, and it is not a rare occurrence that delivery is even more important than price. That standard machinery can be delivered more quickly than special machinery needs no proof. At the same time it is not always so plain to the purchaser why a special request as to speed, exact output, or detail of construction of a machine may delay its delivery three months, whereas a standard machine differing only slightly from the specifications might have been delivered immediately. At the same time the standard machine might meet the requirements and do the work as well or better than the special machine. Change of designs, change of drawings, new patterns, new tools and new castings are matters that are given little thought or consideration by the purchaser, yet these are the things that keep the nonproductive element of a shop busy, make prompt deliveries impossible, and keep the management searching for profit when there is only loss. Do not overlook the fact that these numerous expenses, due to changes of design, must be paid for, either by the purchaser or the manufacturer, and it is often the case that only a part of these extra expenses are paid for by the purchaser, and the rest is made up by a sacrifice of the profit by the manufacturer.

A certain manufacturing company has made 100-kw. direct current generators at the following speeds: 100, 125, 150, 225, 240, 250, 260, 275, 580, 650, 750, 900.

To-morrow they may be asked to make a machine of still another speed. Why? Because the purchaser's specification is drawn so fine as not to permit of a standard machine. It is true that they may be so drawn as to fit one manufacturer's standard machines, but every other manufacturer, in order to meet the specification, must bid on a machine that is special to him. The purchaser therefore receives one bid on a standard machine and five bids on special machines. Does such a specification give the purchaser the benefit of standardization? Assume that the specification is drawn for a belted machine running at 800 r.p.m. Would not 750 or 825 meet the requirements? Had the specification been so drawn that each manufacturer could submit a bid on his standard machine, together with guarantees and full information regarding detail construction, then the purchaser or his technical adviser would have an opportunity of acting as a judge in the matter of selecting the particular standard machine that was best suited to his requirements—rating, price, guarantees, and details of construction all being considered. In other words, the purchaser should act as judge and not as designer.

Another point to which your attention is directed is the value of the investment. Expansion of business often necessitates larger machinery, and it often becomes necessary to dispose of the machinery on hand. The price that can be obtained will now depend upon how well the machinery is suited to the demands of some other purchaser. If you have a motor with a special shaft, a special end head, or a special foot, a sale at any price is difficult to make. At the same time there is always a market for standard machinery.

The price of machinery is usually a base of comparison in purchasing, but operation is the test of quality. Poor operation is dear at any price; it is therefore of interest to the purchaser to determine how he can best obtain full value for the money invested. Certainly not by asking for that which is special or out of the regular line. The development charges on all new machinery constitute a large item, and it is only by standardizing that development charges can be distributed. The purchaser should realize that in selecting standard machinery he will not be burdened with development charges, and he will have the advantage of all the refinements of manufacture whereby standard apparatus, in virtue of being made in quantity, is made both better and cheaper than it could otherwise be. It is therefore plain that the purchaser should make known his requirements to the manufacturer by stating fully the conditions to be met and the work to be done; by so shaping his requests that the manufacturer can offer to him apparatus that is standard and has been "tried out" in all its details. Each specific condition that the purchaser inserts in a specification reduces the probability of standard apparatus meeting the requirements.

---

*Paper read before the National Electric Light Association at its 28th convention, held at Denver-Colorado Springs, Col., June 6-11, 1905.

In other words, the purchaser in making inquiries for machinery should state all necessary requirements, but should carefully avoid the addition of unnecessary requests. If the specifications are so drawn, the manufacturer can offer the purchaser standard machinery with guarantees, and the price of the machinery may be considerably lower than if the purchaser had filled his specifications with a number of unnecessary conditions. Many specifications would be more to the advantage of both purchaser and manufacturer if they were cut short at the end of one page instead of being drawn out to the extent of twenty pages. Let the purchaser define the work to be done, and let the manufacturer prescribe the machine to do it. If the purchaser wants his machine made to order he may be sure that it will be too small in the waist or too long in the leg to suit his neighbor, and that he will have to settle a tailor's bill in addition to a manufacturer's cost.

ELECTRICALLY-DRIVEN ROLLER-BEDS AT THE PHŒNIX STEEL WORKS.*

Live rollers are empoyed in steel and iron works for transporting ingots, blooms, etc., from place to place, and for bringing the material to be rolled again and again up to the rolling mills after the latter have been reversed in direction. A considerable number of such live roller-beds, electrically-driven, are in successful operation at the Phœnix Iron and Steel Works in Laar, near Ruhrort (Germany). Part of the electrical energy generated is used for lighting the works and part is used for running a number of motors, including those for the roller-beds, while a 1,200 hp. motor for driving the rolling mills is in course of erection. The generating plant consists of three 1,000 hp. blast-furnace gas engines, each of which is directly coupled to a three-phase generator of similar capacity. Three additional 800 hp. sets are nearing completion, if they have not already been put into service by the time this article appears.

At present the Phœnix Works makes use of the roller-beds for feeding the ingots to the reversible cogging mill, for transporting the blooms to the bloom shears, for handling the material at the shears, and for transporting the material after having been cut. In addition, some further roller-beds are being put down in connection with the rail rolling mills, sleeper-rolling mills, etc.

Roller-beds for the Cogging Mill.—Live rollers are provided in front of and at the back of the cogging mill. Those in front have the following dimensions and weights: One stepped roller, having diameters of 1 ft. 7¾ in., 1 ft. 10 in. and 2 ft. ½ in., a length of 8 ft. 9 in. and weighing 9,800 lbs.; one roller, having a diameter of 1 ft. 5½ in., a length of 9 ft. and a weight of 8,700 lbs.; 10 rollers, each having a diameter of 1 ft. 5½ in., a length of 11 ft. 6 in. and a weight of 9,900 lbs.; one roller, having the same diameter, but 9 ft. 10¾ in. in length and weighing about 8,900 lbs.

The first two rollers at the back of the cogging mill are identical with the corresponding rollers at the front of the mill. These two live rollers are then followed by six others, which are of exactly the same dimensions and weight as the 10 rollers referred to above. All the rollers are solid and of forged steel. Their spindles have a diameter of about 7 in. The front roller-bed and the back roller-bed weigh, complete, about 65½ tons and 41 tons respectively, and these weights include the gear wheels and the countershafts, the latter being 6¼ in. in diameter. The cogging mill has to deal with about 1,200 tons of steel every 24 hours, the ingots weighing from 2.6 to 3 tons. Each ingot, therefore, requires about 3½ minutes for rolling. It is passed altogether from 20 to 24 times through the cogging mill in about two and a half to three minutes, according to its size. Each roller bed has thus to convey the block from 10 to 12 times to the mill during rolling. The motor equipment of each roller-bed consists of a 60 hp. 190 volt three phase motor, running at about 620 revs. per min., the frequency of the supply being 47 cycles per second. Motors and countershafting are installed in a pit which is suitably covered in so as to protect them from mechanical injuries. Fig. 1 represents a 30 hp. motor of the same design as the 60 hp. motors. The design and arrangement of the slip-rings is noteworthy and it will be seen that the motors are of the ventilated-inclosed type.

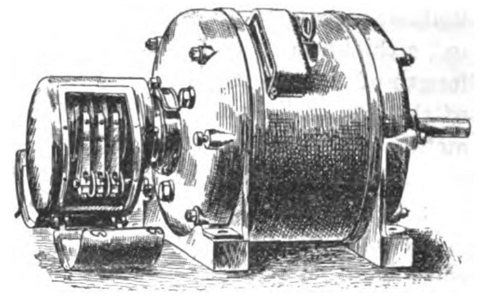

Fig. 1.
30 hp. Three-phase Motor for Driving the Live Rollers.

A platform has been erected above the front roller-bed, from which the operator can see what is going on in front and behind the cogging mill. The reversing controllers are installed on this platform. Fig. 2 shows their general design. They are, it will be noticed, of strong construction and have carbon contacts. At starting a resistance is inserted into the rotor circuit, this resistance being cut out in four steps. There is a special handle for reversing. Each motor is connected to the supply through a switch and a fuse, and each is powerful enough to impart to the steel block a speed of about 5 ft. 5 in. per second within from two to three seconds. Each motor is also capable of reducing the speed of a block from the maximum to zero and accelerating it again up to full speed in the other direction in from four to five seconds.

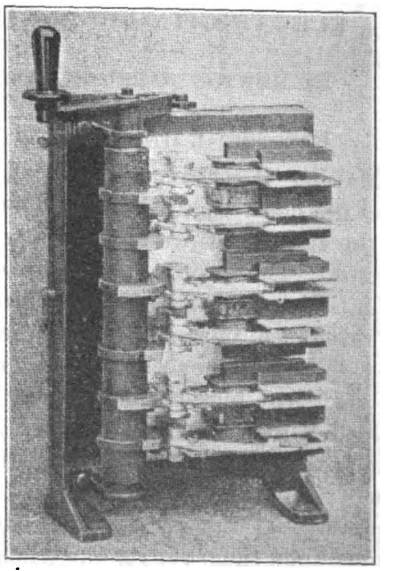

Fig. 2.
Type of Controller for Reversible Roller beds.

Belt Conveyors.—There are three belt conveyors, each of which is driven by a 30 hp. three-phase motor running at 700 revs. per min. As these motors need not be reversed, they are started by an ordinary rheostat with metal resistances.

---

*From the "Electrician," London.

Roller-beds at the Shears.—The roller-bed in front of the shears consists of 15 hollow rollers of a diameter of 2 ft. 1½ in., a thickness of metal of 1⅛ in., and a length of 3 ft. 3⅜ in., and of two rollers of the same diameter and thickness of metal, but having a length of 2 ft. 5⅛ in. At the back of the shears are the following: Six hollow rollers of 1 ft. 3¾ in. diameter, a thickness of metal of 2 in., and a length of 2 ft. 3⅛ in., and 11 rollers having a diameter of 11⅜ in., a thickness of metal of 1½ in., and a length of 2 ft. 2 in. Blooms from the cogging mill are cut by the shears into 10 pieces on the average in from 2½ to 3 minutes. The front roller-bed is driven by a 30 hp. three-phase motor, while the back roller-bed is operated by a 60 hp. three-phase motor. Both motors run intermittently and at about 620 revs. per min. In design they follow the same lines as the motors referred to before, and the controllers, too, resemble in construction those alluded to above. A platform is erected at the side of the shears for the operator who is able to cause the blooms to be shifted very accurately. With relation to the shears it is said that by switching on and off quickly the material may be moved by as little as 5 mm. (0.2 in.) at a time.

ELECTRICITY LEAFLETS.

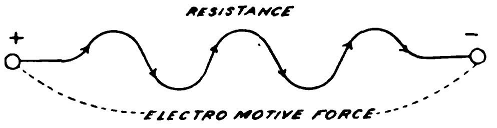
BY NEWTON HARRISON, E. E.

ELECTRICAL MEASUREMENTS.

Making measurements of electricity does not consist entirely of measurements of the amount of pressure or current in a circuit. The process is more extensive than this and embraces the measurement of resistance, power, induction, magnetic flux, etc. In other words, under the title of electrical measurements may be included a great variety of tests in electricity and magnetism, many of which are of such great importance that it may be said that the very science itself depends upon them for its existence.

Ohm's Law.—The corner stone of the science of electrical measurements rests upon a true knowledge of Ohm's law. As far as this is concerned, Ohm's law presents itself first in the familiar form so well expressed by the statement that "the current is proportional to the electromotive force and inversely proportional to the resistance." Then it appears under two other guises, in which, instead of the value of the current alone being given, the value of the resistance and EMF. are expressed in simple terms.

Forms of Ohm's Law.—The forms of Ohm's law are those in which the current, resistance and electromotive force are so related that when two are given the third can be found. For instance, when resistance and current are given volts are found; when volts and current are given resistance is found; when volts and ohms are given current is found. The three elements composing Ohm's law whose relationship must be expressed as indicated are:



Simple case of EMF. acting on a non-inductive circuit.

1. Resistance given in ohms.
2. Current given in amperes.
3. Electromotive force given in volts.

It must be remembered that when two are given to find the third, multiplication occurs once and division twice, as follows:

To get volts multiply amperes by ohms.

To get amperes divide volts by ohms.

To get ohms divide volts by amperes.

Here, it is observed, that to get volts, multiplication is necessary between the other two. On the other hand, to get either amperes or ohms the volts must be divided. There are, therefore, only two processes, multiplication and division—the multiplication of current and resistance, and, to get the other two values, the division of the pressure by either the current or resistance.

Problems in Ohm's Law.—To illustrate these applications the following cases are given: To find out how many volts are required to send 10 amperes through a resistance of 100 ohms. In this case the volts are to be found, and the two values given must be multiplied together:

Volts = amperes × ohms = 10 × 100 = 1,000.

The next case is to find out how many amperes will pass through a lamp taking 110 volts, whose resistance is 220 ohms. The other two cases, as stated, call for division. In this particular instance the amperes are to be known. According to the law

Amperes = volts ÷ ohms = 110 ÷ 220 = ½.

The physical fact to be kept in mind is that an incandescent lamp has a high resistance when cold and a much lower resistance when hot. A resistance test would show that the lamp when cold equals 450 ohms, while at incandescence the carbon falls to 220 ohms.

The third case is the one in which the resistance of a coil of wire is to be found which takes a current of 2 amperes and a pressure of 110 volts. When either current or resistance are to be found, division takes place as follows.

Ohms = volts ÷ amperes = 110 ÷ 2 = 55.

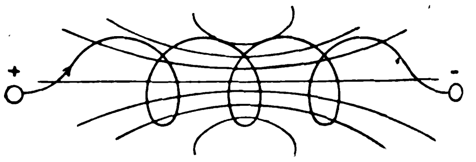
The methods employed in applying Ohm's laws to practical cases are given below in a concise form:

Volts divided }
" " } give amperes or ohms.

Volts obtained } multiply amperes by ohms.

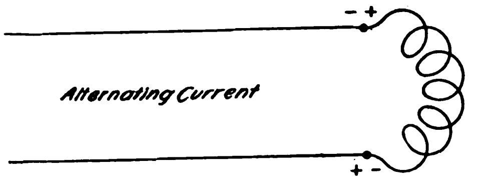
These are the simplest illustrations of Ohm's law as employed by electrical workers all over the world. They may be considered as the most important forms in which it appears. It undergoes other changes in alternating current theory, because of the fact that additional influences are operating besides those ordinarily appreciated. The above forms, while true, would therefore be inapplicable to circuits carrying variable currents.

Ohm's Law for an Instantaneous Current.—When a current is turned into a circuit for an instant and turned off, or when a current is first sent into a circuit, the current for a short period of time is not exactly equal to the volts divided by the ohms. There seem to be other influences at work which partially arrest the free flow of the current. It cannot be said that this influence is due to the resistance of the wire, because if this were only the case, Ohm's law would hold true in every sense of the word. The difficulty, however, is not so much inside the wire as outside of it. The extent of the influence playing upon the outside of the wire causes the difficulty. This, it seems, acts in such a manner that a current cannot be instantaneously sent into a wire at its full strength, neither can it be instantaneously cut short. The wire possesses the power of developing, through this external influence surrounding it, *an electromotive force of its own.*



A current passing through an inductive resistance and meeting with retardation.

When the blacksmith strikes the anvil, the hammer flies back. In a sense, when a current strikes a circuit, the circuit strikes back. The sound may be absent and there may be no visible signs of this reaction, but it is always there. From a scientific standpoint, it is stated that the magnetism around the wire, which sur-rounds it when a current flows, momentarily develops this counteracting influence. It acts against the *incoming* current, checking it, and naturally only permitting it to rise to its full value in a certain period of time; or it acts with the retreating current when the circuit is opened, augmenting its pressure at this last moment. It had been noted for quite some time, before an examination of the conditions had been made by eminent physicists and mathematicians, that rapidly changing currents did not seem to flow in obedience to Ohm's law. Neither did Ohm's law, as then understood, coincide in its results when applied to those obtained with a current turned rapidly on or off. The fact that the current took an appreciable time to rise to its full value and did not immediately cease in a circuit opened and closed, gave room for thought. It soon became evident that the simple form of Ohm's law for these conditions would not do. It could be correctly applied in the case of a continuous current but not in the case of either an *instantaneous* or an *alternating* current. Helmholtz interpreted Ohm's law in a new form, in which time is considered, and the influence external to the wire called self-induction. The Helmholtz equation, as it is called, is therefore a form of Ohm's law by which the current can be ascertained at any instant. It contains symbols expressing the physical conditions as follows:



An alternating current passing through an inductive resistance.

Current in amperes.
Resistance in ohms.
Pressure in volts.
Self-induction in henries.

System of logarithms called Naperian based upon a value e.

The Helmholtz Form of Ohm's Law.—Helmholtz gave Ohm's law as written, but he added a modifying clause, so to speak. Helmholtz states that the current is equal to the electromotive force divided by the resistance, as given by Ohm himself, but what he adds is true for the value of the current *at any instant.* Ohm's law states as follows:

Current = volts ÷ ohms, but if the ohms are not alone in governing the growth of the current, then the formula does not hold true. It will hold true, however, if the R is correctly stated; therefore Helmholtz adds a parenthesis by which Ohm's law must be multiplied and exact values are obtainable for any condition of the circuit or current. He multiplies E ÷ R by the parenthesis 1 — e raised to the minus R over L times t power; in other words, his mathematical genius enabled him to discover that if from E ÷ R, which gives the amperes under ordinary conditions, a value is subtracted equal to e with a minus exponent equal to $\frac{R}{L} \times t$, then the correct value of the current is obtained. In the formula given the verbal rendering would be as follows:

$$\text{Amperes} = \frac{\text{Volts}}{\text{Ohms}}\left(1-e^{-\frac{\text{Ohms of circuit}}{\text{Self induction of circuit}} \times \text{Time in seconds}}\right)$$

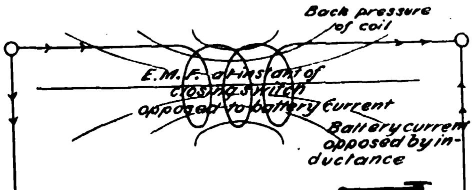
Written with symbols, which are merely the equivalents of the values stated above, Helmholtz's interpretation of Ohm's law for the current at any instant is

$$C = \frac{E}{R}\left(1-e^{-\frac{R}{L}t}\right)$$

To illustrate make
$E = 100$ volts.
$R = 20$ ohms.
$L = 2$ henries.
$t = 5$ seconds.

Then e with its exponent becomes equal to $\frac{1}{e^{50}}$, which is practically equal to zero. This would leave $C = E \div R$ or nothing to subtract. When the time during which the circuit is closed is prolonged, as in this case, to 5 seconds, the simple form of Ohm's law is only left to apply.

Form of Ohm's Law for Alternating Currents.—The influence of self-induction has been referred to in the Helmholtz form of Ohm's law. From this form of the law another interpretation has been obtained which is in a more practical form than the last. In this formula, the effects of self-induction and the frequent changes of the current are considered so that simple calculations can be made. When a current is started in a circuit, at that instant all of the disturbing effects transpire whether the current is continuous or alternating. If the current is alternating in character, the more rapidly it reverses its direction in a second, the more of this reaction takes place in the circuit; in fact, the extent of this impeding influence is given by the formula as follows:



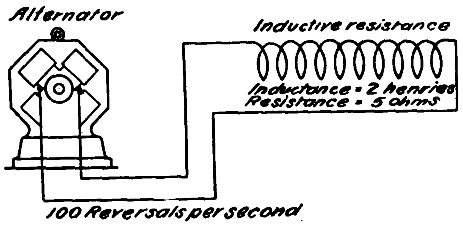
Back pressure of coil
E.M.F. at instant of closing switch opposed to battery current
Battery current opposed by inductance
-
+
Switch

Inductance opposing battery current at moment of closing the circuit.

The impedance = the square root of the resistance squared, plus the product of the self-induction squared, times 2 π, times the frequency squared.

If the symbolic representation of these facts is attempted in which
R = resistance in ohms,
L = self-induction in henries,
$p = 2 \times \pi \times$ the frequency per second,
I = the impedance.

Then $I = \sqrt{R^2 + p^2 L^2}$, or impedance $= \sqrt{(\text{ohms})^2 + (2 \times 3.1416 \times \text{freq.})^2 \times L^2}$. To carry this idea out practically the question might be asked, What is the impedance of a circuit in which the resistance equals 5 ohms, the frequency 100 per second and the henries 2? Then
$R^2 = 5 \times 5 = 25$,
$p^2 = (2 \times 3.1416 \times 100)^2 = 394{,}384$,
$L^2 = 2 \times 2 = 4$,
then $R^2 + p^2 L^2 = 25 + 394{,}384 \times 4 = 1{,}577{,}561$, and the square root of this number equals 1,256. The comparison of the effect of the resistance of 5 ohms and the effect of the impedance in total shows how resistance may be disregarded altogether when the frequency of an alternating current is high or the self-induction in the circuit is high. The resistance having been substituted for by the false resistance, Ohm's law for alternating currents will be



Alternating current meeting an impedance of over 1,200 where the ohmic resistance is only 5.

$$\text{Current} = \frac{\text{electromotive force}}{\text{impedance}}.$$

If there is no frequency, the last characters disappear in the impedance and only resistance is left. For instance, if there was no frequency $p^2 L^2$ disappears and the square root of R^2 is R. The formula then becomes $C = E \div R$. The three forms of Ohm's law as given by Ohm, by Helmholtz, and with respect to the spurious resistance or impedance, all become transformed into Ohm's original form when time is prolonged in one case, and the frequency or inductance disappears in the other.

EDITED BY H. C. ABELL.

Locating Grounds in Buildings.

A handy device for locating the points where wires are grounded in buildings was made by taking a U-shaped yoke of iron and winding it on a coil of very fine wire and connecting this coil to a telephone receiver. When the yoke is brought in proximity to a wire carrying a current a buzzing will be heard in the telephone receiver, and grounds within the walls of a building can be located when carrying a current by moving the yoke along the wall. The method of locating a ground is as follows:

All the lights are turned off, and the main feed tested; if there is a meter, care must be taken to get beyond the meter, as the current taken by the potential coil is sufficient to make the receiver buzz. If a buzzing is heard it can be traced to one of the branches, and this can be followed along the walls until a point is reached where the buzzing ceases or is diminished. This is the point where the current is leaving the conductor, or the grounded point. This apparatus works on both alternating and direct currents, but better on the former.

J. F. DOSTAL, Denver, Col.

Using 50-cp. Nernst Lamps on a Direct-Current System.

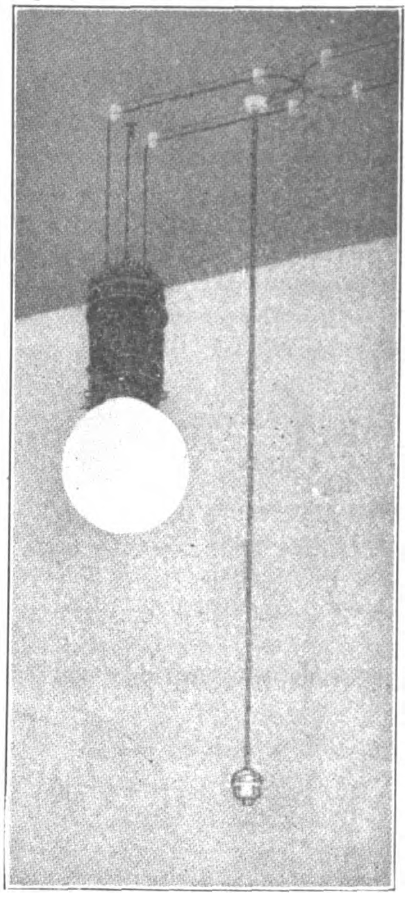
When the Nernst lamp was first put on the market I bought two single-glower, 220-volt lamps. I did not know that they were made for alternating current only. I very soon found that the glowers burned off the second or third time the current was turned on. I noticed that the glower always broke off close to the end where it was cemented to the platinum wire. As an experiment I wrapped the platinum wire around the broken end of the glower, about three turns, leaving the ball of cement on the end of the platinum wire, taking great care to squeeze this ball close into the glower, to take the greatest part of the heat from the glower. After splicing the glowers in this way I have succeeded in burning lamps of this type on direct current about 600 or 800 hours. The scheme, however, is not a commercial success, and I do not advise that it be patented.

E. A. ASPNES, Montevideo, Minn.

New Pendant Switch Device for Any Kind of Electric Light.

The pendant switch has a definite field of usefulness in both arc and incandescent lighting. It has heretofore been applied to incandescent lighting almost exclusively, owing to the inspection rules, which do not permit the use of a single-pole switch on arc lamps.

The pendant switch is, however, capable of as broad application to arc as to incandescent lighting when the device herewith illustrated is used. A standard double-pole, 10-ampere snap switch is fitted with a nickel-plated canopy, which serves to admit the wires to the switch and supports it by a knot made in the cord inside the canopy. The four conductors forming the double-pole switch loop are neatly brought together under one braid, the whole presenting a very neat appearance. The cord is suspended from the ceiling on any of the usual forms of ceiling block.



In wholesale establishment and stores, where it is impracticable to locate the switch near the arc lamp, it has heretofore been necessary to place all the switches in the cut-out cabinet at one end of the room. This makes it necessary for the salesman showing goods on a floor to go to the end of the room and switch on all the lamps which he will require in showing the customer the goods.

By the use of a double-pole pendant switch attached to each lamp he is able to show his goods effectively by turning the lamps on in each section as he comes to it, turning them off as he leaves the section.

Thus it becomes possible for many large establishments, who have not felt able to pay the cost of electric lighting heretofore, to use the superior light of the arc lamp for showing all goods which do not appear to advantage under other light.

The device is also made for use with a single-pole switch, and in this form is adaptable to all uses to which pendant switches have been put heretofore.

The double-pole type may be used on large incandescent clusters or fixtures, the single pole-type not being approved in Chicago for more than six 16-cp. lamps.

The expense of installing the pendant switch is much less than that of wiring to a position on the wall, in most cases. With the type of switch here shown the cost of the canopy is but a fraction of the cost of the standard snap switch.

C. H. STEWART,
Chicago Edison Company.

Flicker Interrupter.

A device, which may be called a "flicker interrupter," is proposed for use in connection with the demand system of charging, where it is impracticable or undesirable to install a demand meter. The instrument serves to interrupt the customer's service when the proper demand is exceeded.

This device is simply an electro-magnetic solenoid with a core which is extended downwards to form a plunger. This plunger enters into a steel cup containing mercury. The instrument is connected to one side of the customer's wiring at the service, one connection being made to the steel cup and the other (flexible) to the plunger.

When the customer's demand is normal, the plunger remains in the mercury, and the circuit is unbroken. If, however, the demand goes above the amount for which the instrument is set, the plunger vibrates in and out of the mercury, causing continuous interruption of the circuit. These interruptions will continue until the excess demand is cut out of the circuit.

LEONARD L. ELDEN, Boston, Mass.

New Electric Furnaces.

The Physical Society (England) recently held one of its meetings at the National Physical Laboratory, and Dr. J. A. Harker then described and exhibited some new types of electric furnace for the attaiment, in absence of noxious gases, of temperatures between 800 degs. C. and 2,200 degs. C. The conductor conveying the electric current is a tube of solid electrolytes similar in composition to the filament of a Nernst lamp. An essential feature is that, for many purposes, the usefulness and life of a furnace constructed in this way may be much increased by adopting a "cascade" system of heating; that is, the energy supplied may be divided, so that only sufficient is put through the tubular conductor to raise its temperature, say 1,000 degs. C. above its surrounding, the surrounding itself being maintained at 7,000 degs. C., thus enabling a temperature of 2,000 degs. C. to be attained in the tube without straining it unduly. The regulation of temperature in small furnaces of this type is so perfectly under control that very well defined melting-points may be taken with very small quanties of substance. The thermo-electric method has been used in these furnaces for determining the melting point of platinum, the mean result of the experiments giving 1,710 degs. C. ± 5 degs. C.

---

*Paper presented before the National Electric Light Association at its 28th convention, held at Denver-Colorado Springs, Col., June 6-11, 1905.

Annual Election of the New York Electrical Society.

The 24th annual meeting of the New York Electrical Society for the election of officers will be held at the Cafe Boulevard, 2d avenue and 10th street, Wednesday, June 14, at 9 P.M. The following nominations of the nominating committee will be submitted:

For President—W. S. Barstow.

For Vice-Presidents—H. G. Stott, Putnam A. Bates and Max Lowenthal. (Vice-presidents elected 1904 for two years are Albert F. Ganz, Louis B. Marks, W. S. Rugg.)

For Secretary—George H. Guy.

For Treasurer—H. A. Sinclair.

New York's Light Commission.

Governor Higgins of New York has appointed as Commissioners of Gas and Electricity James R. Sheffield, of New York; Lucien L. Shedden, of Plattsburg, and ex-Attorney General John C. Davies, of Camden. Each commissioner is to receive a salary of $8,000 per annum, besides being allowed $500 a month for traveling expenses. The commission will have offices in Albany, New York and Buffalo.

Julius E. Marsh Dead.

Julius E. Marsh, 64 years old, superintendent of the Underground Cable Company, 56 Liberty street, New York, was fatally injured Saturday morning by a train at Van Syclen street and Neptune avenue, Coney Island. He was taken to the Coney Island Hospital, but died shortly afterward. The deceased was inspecting some conduit operations when he was struck by the train.

ANNUAL MEETING OF THE AMERICAN INSTITUTE OF ELECTRICAL ENGINEERS.

From present indications there will be a large attendance at the annual convention of the American Institute of Electrical engineers, to be held at Asheville, N. C., June 19 to 23. The following is the list of papers to be read:

"Appalachian Water Powers," by F. A. C. Perrine.

"Three-Phase Traction," by F. N. Waterman.

"Limits of Injurious Sparking in Direct Current Commutation," by Thorburn Reid.

"A Study in the Design of Induction Motors," by C. A. Adams.

"Choice of Motors in Steam and Electric Practice," by William McClellan.

"High-Potential Oscillations of High Power in Large Power Distribution Systems," by Charles P. Steinmetz.

The Constant-Current Mercury Arc Rectifier," by Charles P. Steinmetz.

"Heavy Electric Freight Traction," by C. De Muralt.

"A New Instrument for Measuring Alternating Currents," by E. F. Northrup.

"Motor-Generators and Rotary Converters," by W. L. Waters.

"Limits in Direct Current Machine Design," by Sebastian Sonstius.

"Electrical Features of Block Signaling," by L. H. Thullen.

"The Development of the Ontario Power Company," by P. N. Nunn.

"A New Induction Generator," by William Stanley.

"An Experimental Study on Commercial Transmission Lines of the Rise of Potential Due to Static Disturbances Due to Switching, Grounding, etc.," by Percy H. Thomas.

"Experimental Data Relating to Conductors and Underground Electric Cables," by Henry W. Fisher.

"Methods of High-Pressure Measurement," by S. M. Kintner.

"Weight Distribution on Electric Locomotives, as Affected by Motor Suspension and Draw-Bar Pull," by S. T. Dodd.

"Eddy Currents in Large Armature Conductors," by A. B. Field.

Cannot be Equalled.

Electricity Newspaper Company.

Please find inclosed postal money order for one dollar, for which continue my subscription for one year for ELECTRICITY. It is the best electrical paper I have read for the money. It cannot be equalled. Yours truly,

HENRY D. THOMAS,
515 William Street, Elmira, N. Y.

ELECTRICAL PATENT RECORD.

LETTERS PATENT ISSUED JUNE 6, 1905.

Electric Railways and Appliances.

791,556. Trolley-Wheel. John Hensley, Huntington, Ind. Filed July 20, 1904.

791,633. Trolley. David Lippy and Abraham Nicodemus, Mansfield, O., assignors of one-third to George Moorhead, same place. Filed Nov. 7, 1904.

791,750. Trolley-Retrieving Device. Henry B. Clarke, Oak Park, Ill. Filed Sept. 3, 1904.

791,777. Car-Fender. Joseph Hastreiter and Clemens Dillhoff, Morgantown, W. Va. Filed March 18, 1905.

791,816. Current-Collecting Device for Electric Cars. Leon W. Pullen, Philadelphia, Pa., assignor to the Wireless Railway Company. Filed July 18, 1904.

791,835. Trolley. Louis M. Steele, Middletown, O. Filed Nov. 12, 1904.

791,836. Electric Train-Control System. August Sundh Yonkers, and Axel Magnuson, New York City. Filed Feb. 16, 1905.

791,972. Automatic Electric Signaling System for Railways. David C. Wolfe, Lyons, Kan. Filed Jan. 5, 1905.

791,984. Train-Controlling Mechanism. Henry V. Miller, Chicago, Ill., assignor to the Miller Signal Company, same place. Filed Jan. 14, 1905.

Electrical Machinery and Apparatus.

791,464. Electric-Motor-Controlling Device. Arthur E. Handy, Providence, R. I., assignor to the Rhode Island Elevator & Machine Company. Filed Sept. 19, 1904.

791,594. Electromagnetic Block System. Guion Thompson, Two Harbors, Minn., assignor to the Thompson Safety Appliance Company. Filed May 16, 1901.

791,673. Electric Meter. Frank P. Cox, Lynn, Mass., assignor to the General Electric Company. Filed March 2, 1903.

791,780. Electric Time-Switch. Jacob Helmstadter, Jr., McKeesport, Pa. Original application filed Dec. 11, 1903. Divided and this application filed July 26, 1904.

791,785. Direct-Reading Horse-Power and Watt Meter. Harry Hertzberg and William P. Snyder, New York City. Filed Feb. 2, 1904.

791,885-886-887. Controller for Electric Motors and Motor-Controlling System. Arthur C. Eastwood, Cleveland, O. Filed Sept. 14-16 and Oct. 24, 1904.

791,954. Time-Controlled Electric Switch. Joseph G. Swallow, New York City. Filed July 23, 1904.

Telephones and Telephone Apparatus.

791,655-656. Telephone-Current Reinforcer or Relay. Herbert E. Shreeve, Newton, Mass., assignor to the American Telephone & Telegraph Company. Filed July 8, 1904, and Feb. 28, 1905.

791,657. Telephone-Transmitter. Emil R. Snyder, New York City, assignor of one-half to Rudolf Lenk, Brooklyn, N. Y. Filed March 21, 1904.

791,892. Telephone-Transmitter. Milton J. Fletcher, San Antonio, Tex. Filed March 3, 1904.

Miscellaneous.

791,491. Facsimile-Telegraph Apparatus. Herbert R. Palmer, Cleveland, O., assignor by mesne assignments to the Electrograph Company of America. Filed Feb. 25, 1901.

791,547. Vapor Electric Apparatus. Samuel Ferguson, Schenectady, N. Y., assignor to the General Electric Company. Filed Jan. 18, 1904.

791,562. Electric Flash-Sign. John C. Lion, Philadelphia, Pa. Filed Feb. 20, 1905.

791,582. Automatic Starting Device for Vapor Apparatus. Robert E. Russell, Schenectady, N. Y., assignor to the General Electric Company. Filed March 16, 1904.

791,591. Electromagnet. August Sundh and David L Lindquist, Yonkers, N. Y. Filed Oct. 27, 1904.

791,603. Electrical Contact Device. Henri Beau, Paris, France, and Cipriano Portillo, Madrid, Spain. Filed July 10, 1902.

791,635. Electrode for Primary Batteries. Theodor Mann and Carl Goebel, Duisburg, Germany. Filed Jan. 21, 1903.

791,691. Electric Heater. William S. Hadaway, Jr., East Orange, N. J. Filed Aug. 4, 1903.

791,730. Electrical Mouth-Bath. Johan J. Stanger, Ulm, Germany. Filed June 1, 1903.

791,797. Electric Self-Winding Clock. Apollinarius von Kaspis, Weehawken, N. J. Filed June 23, 1904.

791,856. System of Electrical Distribution. Vincent G. Apple, Dayton, O. Filed Feb. 18, 1904.

791,882. Thermostat. John H. Cornelison, St. Louis, Mo. Filed Feb. 15 1905.

791,938. System of Electrical Distribution. Granville E. Palmer, Boston, Mass., assignor of one-half to Charles B. Price and Frank S. Price, same place. Filed July 5, 1904.

THE TELEPHONE WORLD.

National Interstate Telephone Convention.

The eighth annual convention of the National Interstate Telephone Association will be held at the Auditorium Hotel, Chicago, June 20, 21 and 22, at which a great assemblage of Independent telephone representatives, it is expected, will attend.

The members of the advisory board and the executive council will meet in Chicago on June 19 at 10 A.M., for the purpose of arranging all matters of detail connected with the convention, as provided for in the by-laws of the association.

The meeting will be called to order at 10 o'clock on Tuesday, June 20, and Mayor Dunne, of Chicago, will deliver the address of welcome. The response will be made by Breckenridge Jones, of the Kinloch Telephone Company, of St. Louis. An address will be delivered by James B. Hoge, of Cleveland, on "The National Interstate Telephone Association," followed by Theodore Gary, of Macon, Mo., who will speak on "Ways and Means to Make Our Association a Success." This will conclude the morning session, and the afternoon meeting will be called to order at 2:30 o'clock. This meeting will open by a roll call of States. (Each State has been requested to have some one respond for it. This member will be expected to give a talk of from three to five minutes on the telephone situation in his State).

James S. Brailey, Jr., of Toledo, O., will read a paper entitled, "Shall the Independent Telephone Companies Have an Insurance Company of Their Own?" which will be followed by "Combined Telephony and Telegraphy," by Samuel G. McMeen, of Chicago, and "What Arrangement is Necessary Between the Operators and the Manufacturers to Protect Independent Companies?" by Thomas Bromley, of Muncie, Ind.

Response to foregoing by a member of the manufacturers' committee.

The second day's session will be called to order at 10 A.M., and after a paper by L. B. Brooks, of St. Paul, on "Standard Toll Signs," reports of committees will be received. This will conclude the morning session, the afternoon session being devoted to various papers for the transaction of miscellaneous business and the election of officers.

On June 22 the entire day will be devoted to visiting and inspecting exhibits, and such entertainment as the manufacturers will tender the delegates, the whole to close with an elaborate banquet at the Auditorium in the evening. The entertainment committee has not yet announced its programme, but it is understood that it will have some jolly surprises for the delegates. This committee is composed of the following named gentlemen: P. C. Burns, H. B. McMeal, W. H. McDonough, W. E. Doolittle, G. A. Briggs, J. P. Cracraft and S. A. Dinsmore who will be in charge of the banquet., which will be an elaborate one, with all the trimmings that go to make an affair of this kind a complete sucess.

Two Kansas companies were recently organized—the Riverdale Mutual Telephone Company, capitalized at $5,000, and the Citizens' Telephone Company, of Marvin, with a capital of $1,000.

Telephone System for Long Island Railroad.

The Long Island Railroad is completing, in connection with the electrification of its western lines, a private telephone system, so that the superintendent at Long Island City can keep in touch with all parts of the road. These road telephones will be scattered about the 50 miles of line, no two being more than 2,000 feet apart. There will be about 150 of them, 100 being in special boxes similar to the police telephone boxes, and the rest in the switch towers and stations.

In connection with the telephone service the railroad will introduce a novel method of road inspection by emergency crews of four men who will constantly patrol the road in gasoline motor cars running on the tracks.

The Holland, O., Home Telephone Company, capitalized at $5,000, has been incorporated by Harry W. Lloyd, Edgar C. Hampton, John A. Belford. James R. Kerper and Harry E. Duguid. The incorporators are employes in the office of King & Tracy, who filed the incorporation papers. The purpose of the company is to build an Independent telephone line in Holland, connection with which town will be made with Toledo, through the Toledo Home Telephone Company.

The Independent Telephone Company, of Salt Lake City, Utah, has accepted the franchise as was set forth in the ordinance. It agrees to pay a sum of $100 down within 30 days of acceptance, and $100 each year after first five. It will also pay the city 40 cents annually on all the telephones installed in Amercan Fork, and will allow the city the use of two free telephones.

The directors of the Home Telephone Company, of Kansas City, Mo., have declared a quarterly dividend of 1¼ per cent., payable July 15, on the stock of the company. The officials declare that the company is earning enough to justify the payment of dividends at the rate of 5 per cent. annually. The bid price was advanced 3 points to 75. No sales were reported in Kansas City, but there was some trading in St. Louis.

News from Westfield, Mass., states that the New England Telegraph & Telephone Company has arranged to install a special line to Hampton Plains, for use at the time of the militia encampment. Two public pay stations will be on the field.

F. R. Ogg, attorney, and M. C. Miller, banker, of Olathe, Kan., recently purchased the Olathe Citizens' Telephone Company from Oscar O. Ayers, for $35,000. The company was started a few years ago and now has about 800 telephones.

The Independent Telephone Company of Emporia, Kan., has absorbed the Bell telephone exchange. The Bell Company will retain its long-distance station there.

Telephone girls of Springfield, Mo., have a union which is affiliated with the American Federation of Labor.

A switchboard will be established at Shawnee, Okla., that will serve 1,100 subscribers.

Attorney Philip Ryan, recently stated that he was prepared to appear before the Newport, O., general council in the near future and ask for rights to string wires, both above and underground, for telephone purposes. Mr. Ryan is representing Mr. Kineon and associates, and it begins to look as if the war for cheaper telephone service in Newport were on in earnest.

The Lincoln, Neb., Telephone Company elected the following corps of officers at its recent meeting: President, F. H. Woods; vice-president. A. W. Field; secretary-treasurer, W. E. Sharp. The board of directors consists of the following: C. J. Bills, Samuel Meyer, John F. Dorgan, Mark W. Woods, A. C. Ricketts, George J. Woods, A. W. Field, W. E. Sharp and F. H. Woods.

An association of telephone employes has been formed in England to protect their interest under the transfer to the Government. Some 13,000 have, it is said, joined. The chief question at present is the demand for an equitable pension scheme for all the employes.

The Citizens' Local Telephone Company, Erma, N J., has been formed to maintain telephone lines, etc. Its capital stock is $10,000, and incorporators: Edward A. Wells, H. J. Fleischhauer, John W. DeHersey, H. V. Soults and others.

A telephone system is being constructed along the line of the big irrigating canals in the vicinity of Reno, Nev., to facilitate communication regarding canal conditions between owners of land and the office at the headgates.

The Pennsylvania Telephone Company is soon to start the work of installing a new exchange board at the Pennsylvania Railroad telephone exchange at Enola.

The New York State Independent Telephone Association will hold its annual convention in the Common Council Chambers, City Hall, Albany, June 16.

At a recent meeting of the stockholders of the Laingsburg, Mich., Telephone Company, they voted to increase the capital stock from $25,000 to $100,000.

The Bremer & Black Hawk Mutual Telephone Association has been formed in Iowa with a capital of $10,000. D. G. Boomer is interested.

The Conestoga, Pa., Telephone Company is putting up poles and will install a number of 'phones in the near future.

Fifty new telephone companies will be placed on the tax list of South Dakota this year.

Telephone statistics show upwards of 300-000 rural telephones in use on Iowa farms.

The Lawn Ridge, Ill., Telephone Company has increased its capital from $3,500 to $21,000.

Telephone Incorporations.

The Western Rural Telephone Company, Harper, Mo. Capital stock, $1,600.

The Perry County Telephone Company, New Lexington, O. Capital stock, $35,000. Incorporators: John Amberge, T. W. Potter, Henry Stefen, M. E. Joyce and J. A. Wright.

GENERAL ELECTRICAL NEWS.

LIGHTING.

Batavia, N. Y.—The Genesee County Electric Light, Power & Gas Company has been incorporated with a capital of $100,000 by Simon B. Storer, Syracuse; Raymond M. Walker, and Charles C. Bradley, of this city.

Beloit, Wis.—H. W. Eggleston and Engineer Secole contemplate erecting an electric light plant at the waterworks power house.

Benicia, Cal.—Col. William S. Patton, chief quartermaster of the Department of California, has received authorization from the War Department to install electric lights at the Benicia barracks.

Cherry Valley, N. Y.—The proposed electric lighting plant for this place embraces the building of two dams and laying of a long pipe line in addition to usual expenses of such a project. The company expects to be able not only to furnish light to Cherry Valley and Sharon Springs, but also to those living between these places who may desire it. It also hopes to be able to furnish power to a limited extent for other purposes.

Cordele, Ga.—The electric service through the business part of this city was lately damaged by fire. The loss is estimated at $50,000.

Dardanelle, Ark.—Bonds have been sold to the amount of $17,000, for the purpose of installing an electric light plant here, to be owned and operated by the town.

Lake Charles, La.—The city council has passed an ordinance calling an election June 27 for a vote as to whether or not the city shall issue bonds to the amount of $75,000 for the establishment of an electric lighting plant.

Maywood, Mo.—Residents of this place are looking to Independence for their electric lights and have made a proposition to pay the expense of wires to that locality, provided they are credited with light bills in similar amounts.

Mexico City, Mex.—The Mexican Light & Power Company, a Canadian concern operating here, has purchased all the light and power plants of this city. This is believed to be the largest individual deal in the commercial history of Mexico. The amount paid the Mexican Gas & Electric Company is $5,000,000 and to the Idlefonso Company $4,000,000 in stock and $2,000,000 in bonds are given for its properties, the total figures of the deal being $11,000,000. The expenditures of the Mexican Light & Power Company when work is completed will be $40,000,000.

Mill Shoals, Ill.—This city will soon have a system of electric lights.

Monroe, Mich.—After five years of municipal ownership of its electric lighting plant this city is talking of disposing of it. One official suggested that it be leased for 10 years, others thought it should be sold. The Detroit, Toledo & Monroe Short Line people have made a proposition to furnish light, and a committee will report to the council.

New Orleans, La.—The Consumers' Electric Light Company has secured a site for its plant and will at once begin the erection of a first-class and completely equipped building.

New York City.—The Empire State Gas & Electric Light Company, capitalized at $50,000, has been incorporated by William H. Cooper, N. Raymond Fox and Claude J. Van Slyke. —The New York Edison Company and the United Electric Light & Power Company announces that on and after July 1 the price of electric current supplied to retail customers will be 10 cents a kilowatt hour for both electric lighting and power. The new rate will not affect the bills of customers who are now, owing to high average use of installation, purchasing electric current at low prices. Unless written notice to the contrary is received, all existing contracts will be continued in force at the modified rate.

Phœnixville, Pa.—An electric light plant, to furnish light at a greatly reduced cost, is proposed for this place, Royersford and Spring City.

Reading, Pa.—The council has purchased the Charming Forge mill dam and old saw mill property, and will at once begin the erection of a suitable building for the electric light plant.

Springfield, O.—John Ryan has formed a company which will install an electric plant at Yellow Springs, for the purpose of lighting that town.

Trenton, Mich.—The electric lighting plant in this city was recently destroyed by fire, entailing a loss of $5,000.

Topeka, Kan.—There is a rumor to the effect that there is another electric light company which will shortly ask the city council for a franchise to manufacture and sell light to this city.

Warren, Tenn.—An electric light and waterworks franchise has been granted to Fred L. Purcell by the city council.

STREET RAILWAYS.

Casper, Wyo.—A movement is on foot here for the formation of a syndicate to construct an electric railroad from this city to Alcova, the site of the great Government dam of the Pathfinder, or North Platte project.

Cheyenne, Wyo.—A meeting of the Cheyenne board of trade is to be called soon to hear a proposition from Judge John Porter, of Des Moines, Ia., to build an electric car system here. Judge Porter has investigated conditions and is convinced that such an investment would pay. He proposes to put in a $100,000 system, provided Cheyenne citzens will subscribe $20,000 worth of bonds.

Council Bluffs, Ia.—The electric line survey from here has now progressed to a point seven miles northeast of Treynor.

Denver, Col.—C. P. Bolmar, of Topeka, Kan., an officer of the Railway Supplies Company, is forming a company for the purpose of building an electric line from the lakes to this city by way of Kansas City.

Dubuque, Ia.—An electric road is to be built from this city to Platteville, Wis.

Elm Grove, W. Va.—Surveys for a new trolley line between here and Mozart Park have been made.

Galesburg, Ill.—The new trolley company which has acquired the defunct lines of the old Monmouth & Galesburg Company, will at once build a system connecting Monmouth and this city.

Jersey City, N. J.—The Jersey City street and water board has passed a resolution directing the trolley, telephone and telegraph companies to place all their wires underground within one year after Mayor Fagan shall approve the resolution. The board also ordered that all poles and rails shall be removed from streets where cars are not run.

Los Angeles, Cal.—The Los Angeles-Pacific Company proposes to extend its electric line to Irwin Heights.

New Brunswick, N. J.—If the present intention of building a trolley line from Freehold to Asbury Park is carried out there will be a continuous trolley line from this city to Asbury Park, and from New York to Asbury Park through this city.

Newburgh, N. Y.—The Upper Hudson Electric & Railway Company has been formed to operate an electric road. Its capital stock is $500,000, and incorporators, Luke F. Gillespie, J. N. Sheehan, Eugene Wolfe, N. W. Titus, T. M. Sheehan, N. W. Dalton and F. J. Curnick.

Norfolk, Va.—A new electric trolley line will be built through Norfolk County, connecting Ocean View and Pine Beach. A syndicate composed of local people has been quietly at work for some time securing rights of way for the new road, and it is proposed to begin construction so that the line can be in operation before the close of the summer season. There is $300,000 capital behind the new road, and it is announced that J. W. Perry, of this city, is interested.

Peoria, Ill.—The Central Railway Company has increased its capital from $1,050,000 to $1,260,000. Its object has been changed to operate an electric railway in the city and county of Peoria, and the counties of Tazewell, Woodford, Marshall, Stark, Knox, Fulton, Mason and Logan,

South Bend, Ind.—The South Bend Western Railway Company, incorporated with a capital of $100,000, will build an electric line from Laporte to this city, 28 miles, and from New Carlisle to Michigan City, 16 miles.

POWER PLANTS.

Chattanooga, Tenn.—The Chattanooga & Tennessee River Power Company of Hamilton County, with a capital stock of $3,000,000, has been incorporated by C. E. James, Josephus C. Guild, R. H. Williams, Morris Headrick and James C. Sims. The developing of the water power in Hamilton and Marion Counties, and the manufacturing and distributing of electricity is the purpose for which the company is formed.

New Castle, Pa.—The Western Pennsylvania Power Company is getting ready to commence operations in this part of the country. The company, which is composed of Pittsburgers, has a capital stock of $10,000.

BIDS WANTED.

Washington, D. C.—The Navy Department through the Bureau of Supplies and Accounts is inviting sealed proposals until June 27 for furnishing Eastern Navy Yards with the following electrical supplies: Schedule 301, motors, generating sets; schedule 302, generators; schedule 303, incandescent lamps, wire, rheostats, mica, miscellaneous electrical supplies. Blank proposals and full schedules can be obtained upon application to the Bureau or to the Navy Pay Office in New York.

NOTES FOR INVESTORS.

Latest quotations for copper are: Electrolytic, 15⅛@15¼c.; Lake 15⅛@15¼c.; casting, 14⅞@15c.

The United Traction & Electric Company of New Jersey has declared a dividend of 1¼ per cent., payable July 1.

The Federal Telephone Company of Cleveland, O., will soon be dissolved. The company owes about $3,000,000.

Philadelphia Union Traction Company directors have declared a semi-annual dividend of $1 a share, payable July 1.

The New England Telephone & Telegraph Company will require for new construction work during the year, it is estimated, $4,750,000.

The General Electric Company has declared the regular quarterly dividend of 2 per cent., payable July 15 to shareholders of record June 19.

The regular quarterly dividend of 1¾ per cent. on the stock of the Manhattan Railway Company of New York will be paid July 16. Books close June 28 and reopen July 10.

Judge Halsey, of the Circuit Court, Milwaukee, Wis., has appointed John E. Reilly receiver of the Independent Consolidated Telephone Company of that city under a bond of $30,000.

The Interborough Rapid Transit Company of New York has declared a quarterly dividend of 2 per cent., an increase of ¼ per cent. over the previous payment, payable at the office of August Belmont & Co., July 3.

The deficit of the Metropolitan Street Railway Company of New York in nine months is $1,322,405, suggesting $1,900,000 for the year. This discrepancy between earnings and the guaranteed 7 per cent. dividends the Metropolitan Securities Company must make good.

The 2,000 additional shares of stock of the United Electric Light Company of Springfield, Mass., to be issued at $160 a share, is offered stockholders in the ratio of one new share for each four now held. Subscriptions close June 24, payment in full being called for on July 3.

According to a recent statement issued by F. R. Henry, auditor of the United Railways Company of St. Louis, the gross earnings of the corporation for the month of May were $756,357, as against $841,006 for the month of May last year, during the World's Fair. The gross earnings for May, 1903, were $644,457.

Fisk & Robinson of New York have recently purchased all the bonds and stock of the Kansas City-Leavenworth Electric Railway Company. The name of the corporation will be changed to the Kansas City-Western Railway Company. The bonded debt will consist of $1,500,000 out of an authorized issue of $5,000,000 twenty-year 5 per cent. gold bonds. Capital stock, $2,500,000.

After fighting each other for more than thirty years, it was announced on Saturday that the two largest companies manufacturing steam and electric drills have formed a corporation to be known as the Ingersoll-Rand Company. The two companies were the Ingersoll-Sergeant Company and the Rand Drill Company. They have been incorporated under the laws of New Jersey at Trenton with a capital stock of $10,000,000, $5,000,000 of which is preferred stock and an equal amount of common. W. L. Saunders, formerly president of the Ingersoll Company, was elected president.

No. 200½
TRUMBULL ELECTRIC MFG. CO.

You often have jobs where it is necessary or desirable that your service switch and cutout should be protected from dampness, corrosive fumes, or mechanical injury. This is accomplished most easily and inexpensively with a Trumbull Iron Service Box. Everything considered the box will be found cheaper to use than a wooden box lined with sheet iron, and being made of iron it is damp proof, dust proof, fire proof and indestructible, which the wooden box is not. The box is furnished with bushings, or drilled for iron pipe of any size, as desired. Made in five sizes for service from 15 to 300 amperes. The switch is constructed to open back over the fuses, allowing the door to be closed when the switch is open. Altogether, it is the most satisfactory service box made, and can be used safely anywhere. Send for booklet "C" which gives more complete information, and quotes prices. Yours for a postal.

EDITORIAL NOTES.

The Builders' Debt to Electricity.

There are few problems in daily life which attract as much attention as those relating to our own personal comforts. In the home, these comforts in a sense, must be provided. In business circles they have not been enjoyed until recently. The building trades have given an immense impetus through the advent of electricity. The rise in real estate values, the greater value of the buildings constructed for business purposes, and the advantages at present in the transaction of all business, reflects great honor upon the initiators of the original movement in this direction. All fields of conservative work are affected but slowly by innovations. The first tall buildings in New York are now dwarfed into insignificence in comparison with those which came later, yet it was considered a risk and a sensation to attempt to break away from the old traditions. England still sticks to them to-day and the traveler in that staid old country sees nothing but low structures in the very heart of the busiest part of London. Tall buildings in New York, which supply the means of comfort to thousands of office workers, could never have come into existence, nor developed into what threatens to be a fixed natural institution, if it were not for influences which gave rise to them. These influences were primarily dependent upon the enormous values, as they were then considered, asked for small pieces of ground. They were secondarily, the combined advantages arising from the use of steel frames and the introduction of electricity for a host of purposes. Of course the manufacturer of typewriters claims the throne of honor as the business benefactor of mankind. Then follows the telephone company. After these come the elevator concern, the electric light and power company, the electric lamp, annunciator, bell and telegraph company, etc., until the list stretches out to the very sticks and stones of which the building is composed. This is not the attitude, however, which leads to a serious estimate of the greatest influence at work in promoting, on the one hand, the great apartment houses, apartment hotels, and hotels proper; and on the other hand, the remarkable palaces of business, erected in the downtown or commercial districts of every large American city, particularly New York and Chicago.

There are few who would deny that if the choice were to be made by a home-seeker between an apartment house without telephones and electric lights and one supplied with all these accessories that, for equal rents or even slightly higher demands, there would be any hesitation in choosing the more modern place.

This is the keynote to the situation. The idea of modernness is associated with the improvements the present age has supplied. Not only must the home at present possess these essentials to a greater or less degree, but the office building without them would be on its face a failure. The builder and the architect have long recognized these facts and they now co-operate with the steam expert, the elevator builder and the electrical expert in supplying just as much and, if possible, a little more than their competitors in the same field. The swiftly moving elevator in our tallest office buildings, called in many instances an express, is dependent upon electric power for the facility with which it performs its work. The lighting problem of all fine office buildings is emphatically an electric one. The ventilation in many cases belongs to the same category, while the telephone, ticker and signaling devices in the Wall Street district are matters of course. The builder's debt to electricity is as great in some respects as his obligation to those who supply him with the masonry and steel for the gigantic monoliths his ingenuity successfully constructs.

* * *

The Mysteries of the Boiler Room. The boiler room of electric light plants holds a place second to none in the field of applied science. The boiler room, or more properly speaking the boilers, call for the most careful consideration in the estimate of the efficiency to be expected or obtained. The reason for this is in some respects obvious. A boiler is a steam producer. The production of steam is in strict proportion to the absorption of heat. The amount of heat produced by the consumption of coal has nothing to do with the steam production unless the two are forcibly made to stand in a strict relationship to each other. The engineer speaks of the fuel consumption per horse power hour. The electrical expert establishes a ratio between the horse power of the dynamo and that of the engine driving it. And in this manner the problem arranges itself in the minds of both. The boiler and engine to one, the engine and dynamo to the other. If the term efficiency is applied, then the mother of it all, in this chain of devices, must receive first consideration. The boiler is the center of gravity of the system, and if its design does not permit of a high efficiency, then the ineffectiveness of the rest becomes doubly apparent. The furnace of a boiler, its grate bar surface, the character of the draught and of the fuel are considerations which outweigh all else in the plant. If loss occurs here, with seeming neglect, then all the valuable and efficient devices which follow are in a sense wasted.

The remarkable science and skill brought to bear upon the engine, in order to make it yield its proper quota of efficiency, the splendid investigations which led to the successful construction of high grade and durable dynamos, seem like the practice of economy at one end of the system and reckless extravagance at the other. The boiler room contains many mysteries therefore to those who struggle in vain with plants that possess the perverse spirit of a persistently low economy.

The mysteries spoken of only exist through the ignorance of those entrusted with the care of important plants. A good set of boilers is a surer guarantee of financial success in the operation of an electric plant than perhaps any other element of it. Electrical engineers particularly are more apt to concentrate their energies upon the engines and dynamos than upon the boiler plant. As much ripe, up-to-date information is required here as elsewhere. A fuller knowledge will wipe out these discrepancies and remove the so-called mysteries.

UNDER THE SEARCHLIGHT.

Notes and Comments on Various Topics.

The meeting of the American Institute of Electrical Engineers is now in session at Asheville, N. C. Friday will be closing day.

◆

The Western Electrical Inspectors' Association was lately formed in Chicago there being 60 cities of the middle West represented at the charter meeting. F. D. Varnum, electrical inspector of St. Paul, was elected president of the association.

◆

Mr. James Dalrymple, the Glasgow expert, who has been giving pointers to Mayor Dunne of Chicago, says municipal ownership of street railways will not succeed in the United States unless absolutely divorced from politics.

◆

The Magnetic Club of New York will hold its summer meeting at College Point, L. I., June 27.

◆

The entrance examinations for the Massachusetts Institute of Technology will be held at the Rogers Building, Boston, Wednesday, Thursday, Friday and Saturday, June 28 to July 1. A second series of examinations will be held on September 19, 20 and 21. Applicants for advanced standing must pass the June or September examinations, and must present themselves for further advanced examinations in September.

◆

Mr. Nikola Tesla has written another letter about New York's Subway, and this time he predicts a mine horror unless the formation of explosive gas is not halted at once. Mr. Tesla's statement is as follows: "It is to be regretted that this important pioneering enterprise should have been treated with such gross neglect in its most important feature. No opportunity was given me, the inventor and patentee of the system in the Subway, to offer any suggestions. The danger to which I refer lies in the possibility of generating an explosive mixture by electrolytic decomposition and thermic dissociation of the water through the direct currents used in the operation of the cars. Such a process might go on for hours and days without being noticed, and with currents of this kind it is scarcely practicable to avoid it altogether. What the effect of such an explosion would be on life and property is not pleasant to contemplate. True, such a disaster is not probable, but the present electrical equipment makes it possible and this possibility should by all means be removed. The oppressiveness in the tunnel is due in a large measure to the heat supplied by the currents. Some provision for ventilation is imperative, but ventilation will not do away with the danger I have pointed out. It can only be completely avoided by discarding the direct current." Mr. Tesla's statement, it is said, was pooh-poohed at the office of L. B. Stillwell, the chief electrical engineer of the Subway system. Mr. Stillwell refused to commit himself further than to challenge the inventor to make good his charges before the Institute of American Electrical Engineers.

◆

Secretary Foster informs us that the date for the meeting at Erie, Pa., of the International Association of Municipal Electricians has been changed to August 23, 24 and 25.

◆

On June 29-30 at Portland, Ore., in connection with the exposition, will be held simultaneously the Pacific Coast Engineering Congress and the Transmission Convention.

◆

The 15th annual convention of the Canadian Electrical Association assembles at Montreal to-day and will adjourn on Friday. To-day the convention will listen to reports, and papers will be read by Messrs. M. A. Sammett, R. T. McKeen, William Bradshaw and A. B. Lambe. Thursday papers will be read by Messrs. A. L. Mudge, H. A. Burson and Prof R. B. Owens. In the afternoon the delegates will enjoy a special visit and luncheon at the Allis-Chalmers-Bullock Company's factory at Rockfield. On Friday papers will be read by Messrs. K. L. Aitken and William McKay, to be followed by the Question Box and election of officers.

◆

The convention of the National Electrical Trades' Association will be held in Montreal, Canada, beginning June 23. John Foreman, of Montreal, is president of the association.

◆

Under the personal supervision of Superintendent of Motive Power Gibbs, the Pennsylvania Railroad Company is having built the largest electric motor in use anywhere. It will be employed to draw the trains through the North River tunnel. As the tunnel grades will be heavy a powerful motor will be needed. It will follow the general pattern of the motors in use in the Baltimore & Ohio tunnels in Baltimore. It will also be used in the East River tunnel in New York if found serviceable. The new machine will not be completed in less than four months. It will be 38 feet long and will exceed 150 tons in weight. This is considerably more than the weight of any passenger locomotive.

◆

Preparation is being made to lay the third cable to reach from Galveston, Tex., to Coatzacoalcos, Mex., a distance of about 900 miles.

◆

Electric fans are used in the chair cars of the Rock Island Railroad.

◆

THE TANTALUM INCANDESCENT LAMP.*

BY DR. LOUIS BELL.

The writer was lucky enough to receive through the courtesy of Mr. E. D. Adams ten 25 Hefner 110-volt Tantalum lamps. These were, with the kind assistance of Prof. Puffer, put through various tests, and in particular two of them were given a decay test with the rather startling results recently published in a joint paper. The upshot of the matter was that these two lamps, selected as being about the average of the lot in performance, gave a life of some 850 hours before falling below 80 per cent. of their initial candle power, and were both burning at 16.6 cp. at the end of 1,190 hours, although one of them had at some unknown time in the previous three days run broken a filament close to one of the spider arms and had automatically mended itself by the fall of the loose end across the other side of the same loop where it welded itself firmly into place and went on burning.

These two lamps ran 800 hours of their life at a mean horizontal candle power of 20 and at about 2.05 watts per candle, thus giving 16,000 candle hours of useful life at this extremely high efficiency. On a rating of 2 watts per candle average the lamps were good for 600 hours, giving over 12,000 candle hours. On a rating of 1,000 hours they gave nearly 19,000 candle hours at a mean energy consumption of, say, 2.15 watts per mean horizontal candle. The circuit on which the run was made was on the average fully up to the rated 110 volts, although the pressure varied somewhat irregularly, perhaps a couple of volts on each side of this figure.

The light of the Tantalum lamp is, as might be expected from its high efficiency, rather whiter than that of an ordinary incandescent, being as white as the Nernst lamp or the acetylene flame. Its distribution of light is in the present form of filament rather less uniform than that of the common incandescent, being relatively more powerful in a horizontal zone and less powerful for points near the axis. The ratio of mean spherical to mean horizontal candle power, as found in Prof. Kennelly's investigation of the frosted lamps, proved to be .73 and the writer's figure from the clear lamps was substantially the same. The distribution, however, could very easily be improved so that the spherical reduction factor would not differ materially from the usual figures and the light at the top would be correspondingly increased.

Since the Tantalum filament has a low initial resistance (between 55 and 60 ohms) it jumps into incandescence with startling rapidity as compared with a carbon filament, but because of its positive temperature coefficient it seems to be decidedly less sensitive to changes of voltage in its working condition. This is a useful property in certain respects. The fact, however, that the initial resistance of the Tantalum is so low and its thermal inertia so small owing to its small mass and low specific heat, means rather violent heating up, which is probably the cause of some doubts which have been expressed as to the endurance of these lamps upon alternating circuits. It is not difficult to imagine pretty severe strains upon the filament if it had time to cool down much between impulses. If such cooling could take place for instance on an ordinary alternating circuit, the results might be serious.

Some stroboscopic tests were therefore made at the last moment to determine whether at, say, 25 there was a specially violent fluctuation of light from the Tantalum lamp; in other words, to find out whether on a 25 current the filament had time to cool down materially. The result showed that the light fluctuation at this frequency was somewhat but not much more pronounced than in a carbon filament. The Tantalum lamp behaved in fact about like a 10 cp. carbon filament lamp. Even a 75 cp. carbon filament lamp, however, shows perceptible variation under this test. At 60 cp. the fluctuation while still perceptible was trivial both in the Tantalum and carbon lamps. It hardly seems probable that at 60 cp. the life of the Tantalum should be enough impaired to cause serious trouble, but the writer now has some lamps on alternating current tests and proposes to pursue the inquiry.

The Tantalum filament seems to stretch and sag at first as if undergoing annealing and losing the set produced by drawing. Then it shows local bright spots which grow lumpy as if the material tended to flow a little from the heat, and with the increasing lumpiness the filament draws up tight. At this stage it is rather fragile and would probably break easily from vibration or shock. It seems likely that the final break comes just where one of the lumps has reduced the cross-section of the wire beside it. The break in the lamp during test, already referred to, showed considerable attenuation of the loose end.

The lamps as tested showed the following characteristics:

Lamp.	Watts.	C.P.	Watts per candle.
Clear Globes..................	41.58	21.42	1.94
	38.61	20.90	1.84
	41.58	24.93	1.66
	41.58	21.55	1.93
	41.91	21.81	1.92
	41.91	22.59	1.85
Frosted Globes................	40.36	19.79	2.03
	40.34	18.54	2.15
	40.04	18.74	2.13
	40.48	19.27	2.09

The mean result from the clear globes was 22.2 cp at 1.85 watts per candle power, and that from the frosted globes 19.08 cp. at 2.1 watts per candle power.

It is interesting to note that the clear lamp gives just about 1 cp. per inch of incandescent filament, which implies an intrinsic brilliancy of somewhere about 500 cp. per square inch of filament—a figure much higher than in the ordinary incandescent.

As illuminants the lamps are certainly very excellent, but their introduction raises some most interesting questions for the central station operator.

Putting aside all the petty questions that will be raised about the new lamps for commercial reasons, the broad fact remains that we are here dealing with a bona fide 2-watt lamp having a life fairly comparable with the carbon filament lamps now customarily in use. Moreover, it is a competitor of these socket by socket, and not as a substitute with particular requirements as in the case of the Nernst lamp or the very small arcs. There is some doubt as to the life of the Tantalum lamp when exposed to unusual vibration, which may perhaps bar it in some special locations, but for the everyday work of the central station there is good reason to believe it generally applicable.

---

*Paper read before the National Electric Light Association at its 28th convention, held at Denver-Colorado Springs, Col., June 6-11, 1905.

Its price can hardly be said to be fixed in this country, but abroad in Berlin it is about $1, which will give at least a fair line on its commercial results. On this basis and with current at 10 cents per kilowatt hour, one finds taking the new lamps on its 600 hour rating, that the cost of its 12,000 candle hours including the lamp amounts to $3.40. The same number of candle hours from a lamp giving a mean efficiency of 3.25 watts per candle would cost $3.90, exclusive of lamps, i. e., the consumer could afford to pay $1 for the new lamp better than to take the old ones free. With current as low as 5 cents per kilowatt hour, the user of Tantalum lamps could only afford to pay 75 cents per lamp as against getting carbon lamps free. That means that a sliding scale of discounts for lamps according to quantity could be made to catch the consumer at all prices ordinarily charged for current by central stations. Does this mean that the carbon lamp will shortly be down and out? Probably not, for there is no spur like competition to start up improvements, and there are some signs that carbon lamps may be improved enough in efficiency to make things interesting at least with current at the prices charged to very large consumers. This, however, remains to be seen, and the thing which the central man has to meet is the immediate probability of consumers putting upon their circuits lamps taking less than two-thirds the energy per candle power of the best lamps now in use and thereby cutting down their meter bills enormously. Now, broadly, what shall be the attitude of the central station man toward this income—scalping innovation? There are some managers who may be inclined to put up a fight to discourage the user, either by raising pettifogging objections or by trying to discriminate against 2 watt lamps by readjusting discounts in various ingenious ways. The writer is very strongly of the opinion that such a policy is wrong and will certainly lead to ultimate disaster in the form of municipal restrictions or regulations of rates by law. In the long run, opposition to improvements does not pay. If, on the other hand, the central station man hangs quietly on and gives the consumer the glad hand, the change will work to his ultimate benefit. In the first place the Tantalum lamps now made are of 22 cp. instead of 16 and the filament will hardly bear much reduction in cross-section. The tendency therefore will be to use these slightly more powerful lamps taking, say, 42 watts instead of a trifle over 50 watts in the 16 cp. carbon lamps. The actual loss in energy sold is likely therefore to be for the present quite a little less than the difference of efficiency would indicate.

Besides this the attraction of cheaper light will certainly bring into line new consumers so that the net result will probably be an actual increase in sales of current, quite a little of it being along the smaller consumers who pay the higher rates. Such a change means upon the whole more lights connected per unit of capacity in transformers or feeders, and hence a slightly better utilization of material and improved load. In the case of stations with underground service, the change to 2 watt lamps ought to bring with it increased earnings per unit of cable capacity. The fact is that improvements in the efficiency of utilization of electric energy help the business and it is both fruitless and inadvisable to oppose them for any short-sighted notion of small temporary savings.

I have here said nothing regarding the inevitable competition between present lamps and the newcomer. In the first place, the merits of the final issue remain to be determined and in the second place competition in lamps is on the whole a good thing for the user of them, however it turns out. So far as the central station is concerned, it is a case of dog eat dog.

The really important thing is that from now on the station manager will have to deal directly with the 2-watt lamp proposition, for there is no disguising the fact that it is here, and in a form that is quite unexpected. The appearance of Tantalum lamps in quantity may be a little delayed in this country, but delay will improve them as in the case of every new product, and will serve to assure a better understanding of their truly remarkable properties and of their possible limitations. The unexpected has certainly happened, for most engineers had long ago abandoned the idea of a lamp with a metallic filament. Only the discovery of a metal virtually new, and possessed of the most sensational qualities, could have brought about the present striking result.

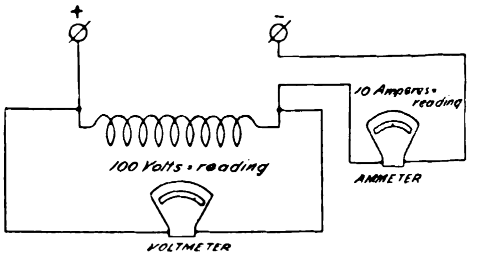
ELECTRICITY LEAFLETS.

BY NEWTON HARRISON, E. E.

ELECTRICAL MEASUREMENTS.

Measurement of Resistance.—One of the most familiar of all tests is that carried on for the purpose of ascertaining the resistance of a conductor. Though it would seem as though this included the general scope of all tests of this character, yet other tests of equal importance in an engineering sense must be made of the very opposite of good conductors, namely, insulators. Thus, tests of resistance might be generally classified as measurements of very low resistances, very high resistances and of resistances which occupy a middle place between these two. To illustrate—resistances of .01 of an ohm, of 1,000 ohms and of 1,000,000 ohms, represent a great difference in value. To make sufficiently accurate tests of these, to give satisfactory results, methods must be employed which belong to the general category of resistance measurements. A few of these tests can be considered under the heads of first, Drop of Potential Method; second, Method of Substitution; third, the Wheatstone Bridge Method.

Drop of Potential Method.—There is no reason to believe that a simpler method than this can be presented in developing the idea of resistance measurements. It is based upon the proposition contained in one form of Ohm's law that the pressure which is necessary in a circuit, to send a given current through a given resistance, is equal to the product of this current by the resistance. In other words, if the proposition is given—find the resistance of a circuit whose lost pressure or "drop" equals 100 volts when carrying a current of 10 amperes; the answer can be readily given on the above basis. A loss of 100 volts, or whatever it may be, is caused by a certain current passing through a definite resistance. The problem in arithmetic form then becomes, 100 = 10 times what value? It is quite evident that the value to be found is 10. The drop in pressure between the ends of the circuit being 100, and the current being 10 amperes, the resistance must



Getting the Resistance of a circuit by voltmeter and ammeter.

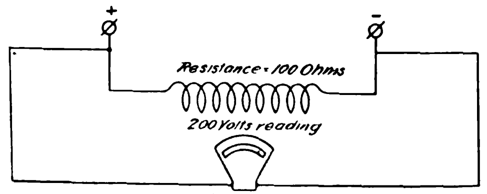
be 10 ohms. The drop of potential method therefore consists in a measurement with the voltmeter of the drop of pressure between the ends of a circuit through which current is passing. The next step, is the measurement of the current itself with an ammeter. Dividing the volts by the amperes will give the ohms as indicated. The test may be made in other ways, which merely represent modifications of this idea without any real change in the method. For instance, if the resistance of the circuit *is known*, it is a simple matter to find the number of amperes passing by ascertaining the drop in exactly the same manner. The drop in volts divided by the ohms will give the amperes. On the other hand, the idea may be still further developed for the purpose of discovering the volts consumed by the circuit. In this case the resistance, which is known, is multiplied by the current which is measured. The product will give the volts lost or "drop" of the circuit. The general idea thus presented covers a means of obtaining the resistance if the amperes and volts are known; the volts, if the amperes and ohms are known; and finally the amperes, if the volts and ohms are known. It is legitimate to include all of these tests under the one general category. Examples crystallizing the application of these methods are given in the following:

DROP OF POTENTIAL METHOD.

To get ohms.......	Measure the drop and measure the amperes.	Divide E by C.
To get amperes....	Measure the drop and know the ohms.....	Divide E by R.
To get volts.......	Measure the amperes and know the ohms..	Multiply C by R.

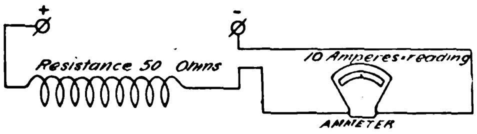
This system shows how a voltmeter is used for measuring amperes when the resistance is known. It shows how to measure volts with an ammeter when the resistance is known and, finally, it shows how to calculate the resistance of a circuit if its drop is measured with a voltmeter, and its current with an ammeter.

Examples of the Drop Method.—A voltmeter shows a drop of 200 volts between the terminals of a circuit carrying a certain current. The resistance is known to be 100 ohms, what is the current in the circuit. Dividing 200 by 100 gives a current of 2 amperes. An ammeter shows a current of 10 amperes in a circuit having a resistance of 50 ohms, what is the pressure or "drop"? Multiplying 10 by 50 gives a voltage of 500.



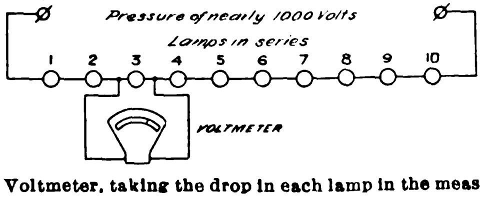
Getting the Amperes of a circuit by a voltmeter, knowing the resistance of the circuit.

How many ohms resistance has an incandescent lamp hot, whose terminal pressure is 120 volts, which takes a current of .4 of an ampere. Dividing 120 by .4 gives a resistance of 300 ohms. It is possible to use an ammeter as a voltmeter or a voltmeter as an ammeter by securing a definite length of copper wire of sufficient size to cause a slight drop when the current passes and yet not dissipate too much energy. For instance, 1,000 feet of No. 10 B. & S. would equal 1 ohm or 500 feet of No. 13, etc. If a piece of wire is obtained whose resistance is known then this placed in series with a motor, the voltmeter giving the drop across its terminals, will be the means of measuring the current. If the voltmeter reads 2 volts, and the resistance of the wire is .1 of an ohm, then 2 divided by .1 equals 20 amperes: If instead of a voltmeter an ammeter is used the test for volts can be made but the resistance must be greatly increased and must be disconnected from the motor if accurate measurement of the pressure is to be made. If the line pressure is 220 volts, it may be sent through a resistance of 100 ohms and the current of an ammeter in series will complete the test. Under these conditions 2.2 amperes would be indicated, the product of this current and 100 ohms giving the line pressure, 220 volts.



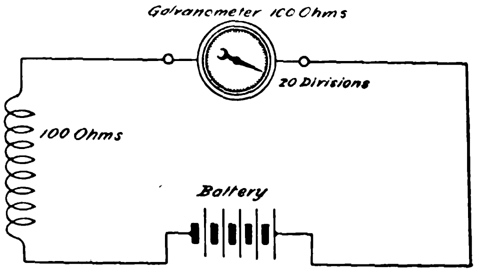
Getting the Volts of a circuit by an ammeter, knowing the resistance of the circuit.

Measuring High Pressures.—If this principle is applied to the measurement of pressures like 1,000, 5,000 or 10,000 volts the following plan is practicable: Either 10, 50 or 100 lamps are connected in series. If about 1,000 volts are to be measured about 10 lamps will do. The total pressure is then sent into this series as shown. A voltmeter is used for the purpose of taking the drop between the terminals of every lamp. The total is found when all results are added together. For instance, if the voltmeter indicated as follows: First lamp, 90 volts; second lamp, 95 volts, third lamp, 100 volts; fourth lamp, 110 volts; fifth lamp, 105 volts; sixth lamp, 98 volts; 7th lamp, 99 volts, 8th lamp, 102 volts; ninth lamp, 85 volts; tenth lamp, 87 volts; then the total equals the sum of 90 + 95 + 100 + 110 + 105 + 98 + 99 + 102 + 85 + 87 volts or 971 in all. An early method of measuring the high pressures of alternating currents before high reading voltmeters were made is thus shown. A resistance measurement by the "drop" method is therefore merely one phase of a practice covering the measurement of pressure and current as well.



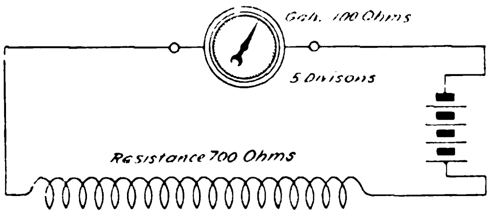
Voltmeter, taking the drop in each lamp in the measurement of high pressures.

Method of Substitution.—Measuring resistance by the method of substitution is really a comparative method. If a certain known resistance will cause an indicating instrument to show a deflection of 100 divisions; and then, when another resistance is put in its place, the deflection falls to one-half or 50 divisions, it is evident that the resistance must be twice as great. The reason for this, is found in the reduced deflection. This means less current or more resistance. If the conditions are otherwise the same, the drop in the reading of the indicating instrument to one-half proves the presence of twice the resistance. Ohm's law, as stated, that the current is directly proportional to the electromotive force, and inversely proportional to the resistance means, when applied to this case, that if the electromotive force has not changed, but the current is one-half as shown by the deflection, the resistance is twice as great. To illustrate this idea, a galvanometer must be connected to a cell of battery and a known resistance of say 100 ohms. If under these conditions, the galvanometer gives a reading of 20 divisions, the record will read, 100 ohms 20 divisions. If the 100 ohms is removed, and an unknown resistance, such as a lamp is put in its place, suppose the galvanometer now shows a deflection of only 5 divisions. The conclusions to be

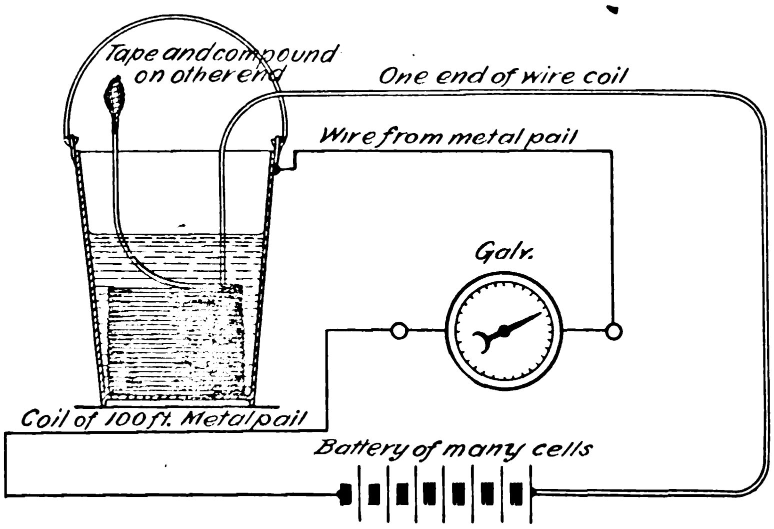


Galvanometer and resistance cause a deflection of 20 divisions.

drawn are as follows: If 100 ohms gives a reading of 20 divisions and an unknown resistance gives a reading of 5 divisions, then the unknown resistance must be greater. Its resistance is so much greater that it reduces the current down from that value, which gives a 20 division reading, to a value so much less that only a 5 division reading is possible. If the galvanometer readings are greater or less, in strict proportion to the current passing through it, then a 20 division reading and a 5 division reading fully express this idea. The reading has been reduced in the galvanometer from 20 to 5 divisions because the current passing through it has been reduced. The reduction is due to the new unknown resistance substituted for the known resistance. If the reading was cut down 20 to 5, the current must have been cut down in like proportion. Its reduction to $\frac{1}{4}$ of its original value is due to the fact that the resistance must be four times as great. If the resistance in the first case was known and valued at 100 ohms; in the second case the diminished reading to 5 divisions shows the presence of a resistance, which in conjunction with that of the galvanometer must equal four times the original. If the galvanometer $= 100$ ohms, then the proposition shows that $100 + 100 = 200$ ohms, causes a deflection of 20 divisions. It also shows that $100 +$ an unknown resistance gives a deflection of 5 divisions. The question that naturally arises is "What is the unknown resistance?" As previously stated, it must have taken four times the resistance to reduce the reading from 20 to 5 divisions. This being the case, the 200 ohms in the first instance must have been increased to 800 by the addition of the unknown resistance. If the galvanometer resistance, however, is 100 ohms, then the unknown resistance must be equal to 700 ohms. Thus, the method of substitution as outlined, calls for a knowledge of the resistance of the galvanometer, or indicating instrument. It also calls for a knowledge of the value of the first resistance interposed. With these facts known, it is evident that any reasonable resistance may be substituted for the first, and if the deflection is taken, its resistance readily calculated.

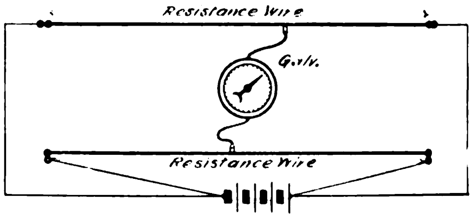


Galvanometer and a substituted resistance cause a deflection of 5 divisions.



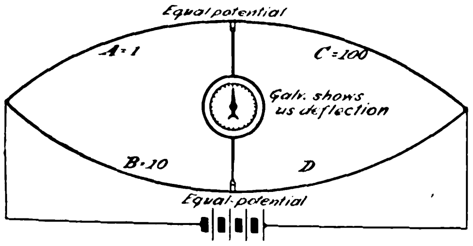
Measuring insulation resistance of rubber-covered wire.

Measuring the Resistance of Insulation.—Insulation has resistance, though it is enormous compared with conductors. An insulator so-called, is not an absolute non-conductor, but a very poor one. The idea is relative. A pressure of 1,000 volts, applied to a resistance of 1,000 ohms would mean a current of 1 ampere. A pressure of 1,000 volts applied to a resistance of 1,000,000 ohms, would mean a current of $\frac{1}{1000}$ of an ampere. If the pressure is lower, the current is correspondingly less. A telegraph line is supported on insulators. Though made of glass, these insulators permit current to leak from the line to the ground. Not one alone is responsible for the entire leakage, but the sum total. An infinitesimal current from one, multiplied by the number of insulating supports, would give the total current. If in the above case, the one thousandth of an ampere was multiplied by 10,000, the total would equal 10 amperes. This is not entirely an imaginary case for the reason that 10,000 insulators, at the rate of 25 to the mile, would only equal 400 miles between stations. The leakage per insulator might be less than that stated, but whatever it was, it would be multiplied by 10,000 on a 400 mile line. Not only is it necessary to know the relative merits of insulators for line service in order that line leakage may be reduced to its lowest value for telegraphic and other lines, but the insulation of power-carrying wires must be known as well. The following is an outline of the method of measuring insulation resistance, by the principle of the substitution of one resistance for another: The requirements are a metal pail, a sensitive high resistance galvanometer, and a carefully tested high resistance. With these, the value of the resistance of high grade insulation, reaching into the millions of ohms, can be found. The insulator, or insulated wire, is so placed in the water that the current passes through from the metal pail into the conducting solution into the insulation, and then out via the wire. If a coil of insulated wire is tested, consisting of say 100 feet of rubber covered wire, then one end of the wire is carefully coated with tape and an insulating compound. The other end leads out, also a separate wire connected to the metal pail. The coil is laid in the pail and covered with water slightly tinctured with sulphuric acid to lower the resistance of the water. The preliminary test is then made with a resistance of 10,000 ohms, which will cause a deflection of 50 divisions in the galvanometer. Supposing the galvanometer to possess a resistance of 10,000 ohms, the first galvanometer deflection is due to 20,000 ohms in all. Removing the 10,000 ohms resistance from the circuit, the insulated coil situated as described in the water, is substituted in its place. If the deflection in this case is only one division, then it is clear that 50 times the resistance is in place now. In other words, where 20,000 ohms gave 50 divisions, it has taken 1,000,000 ohms to cut this down to 1 division. Of the million ohms, 10,000 are due to the galvanometer resistance. The balance of 990,000 is the resistance of the hundred feet of insulated wire in the metal pail. As a single foot of wire would be higher than this; in fact 100 times as great, it may be stated that according to the test 1 foot of this wire has an insulation resistance of 100 times 990,000 ohms or 99,000,000 ohms, commonly called 99 megohms.



Finding a point on each wire which will cause no deflection of the galvanometer.

The Wheatstone Bridge.—This almost historic instrument is perhaps the most extraordinary device in the world. By its means, resistances can be measured with equal accuracy which express a range of difference equal to the ratio of $\frac{1}{1000}$ to a million. This ratio numerically is that of 1 to a billion and cannot be equalled by any simple device extant. It is as though a pair of scales could weigh with equal accuracy, one one-thousandth of an ounce and a million ounces. This extraordinary device is used for the purpose of measuring all kinds of resistances, high and low. The value of insulation resistances of the greatest figure are discovered by the preceding method. But for general resistance measurements, the Wheatstone Bridge is all comprehensive. It practically consists of a loop of wire so constructed that a galvanometer whose terminals rest on each wire of the loop respectively, will indicate the difference in drop between one part of the wire to which it is attached, and the part of the other wire to which it is similarly joined. For instance, if two parallel wires of a certain resistance carry a certain current, it is easy to realize that the terminals of a galvanometer will find a place on each wire respectively where the drop will be equal. Under these conditions no current could possibly flow into the galvanometer. If the upper or lower terminal of the galvanometer is shifted a trifle either way, it will take a potential either higher or lower than the other wire, and a current will consequently flow through the instrument. When the two points spoken of are found, however, the galvanometer remains unaffected. This condition was expressed by the saying that the A arm was to the B arm as the C arm was to the D arm. By this is meant that the resistance of A, B, C and D bear a certain relationship to each other. If they are given such values as 10, 20, 40 and 80 ohms; then 10 is to 20 as 40 is to 80. In other words, the ratio of A to B and C to D, and the fact that A is to B as C is to D, is only true when the galvanometer terminals reach these particular points where the "drops" of the two wires are alike. If the two wires are joined at each end to form a loop with the galvanometer between and a battery supplying the joined ends with current, then the conventional Wheatstone Bridge appears ready for service. In practice, the A and B arms express the ratio of 1 : 10 or 1 : 100 or 1 : 1000. The C arm is adjustable, so as to develop a balance between itself and the resistance to be measured. Supposing the A and B arms are set at the ratio of 1 : 100, then if the unknown resistance is inserted, and the C arm adjusted by manipulating the resistance it represents until the galvanometer does not show any deflection, the bridge is said to be balanced. If the balance was only possible when the C arm was made equal to 100 ohms, then the D or unknown resistance must be equal to 10,000 ohms. The method is simple enough if the necessary ratio of A : B = C : D is remembered. Carrying out this idea with A = 1, B = 10 and C = 100, will give 1 : 10 = 100 : D. According to these figures, the proportion will only be satisfied if D = 1,000 ohms. If the bridge is constructed with many A and B ratios, the range of measurement is thereby greatly increased.



Bridge balanced, by finding points marked equal potential for galvanometer terminals. The galvanometer is at rest.

THE SINGLE-PHASE RAILWAY SYSTEM IN ITALY.*

BY E. A. KERBAKER.

It is not uncommon in Italy to find towns of considerable importance which are lacking in facilities for intercommunication, on account of the mountainous nature of the country. In many instances the distance between a town and the nearest railway amounts to several miles, and generally there are gradients all along the route exceeding 1 in 10. Therefore traffic, even with carts, is laborious, and these places are in a very unfavorable position from an industrial standpoint.

Electric traction, in some instances, and motor-car services in others, have effected great improvements, having made it possible to develop traffic which it had been impossible to carry on with steam.

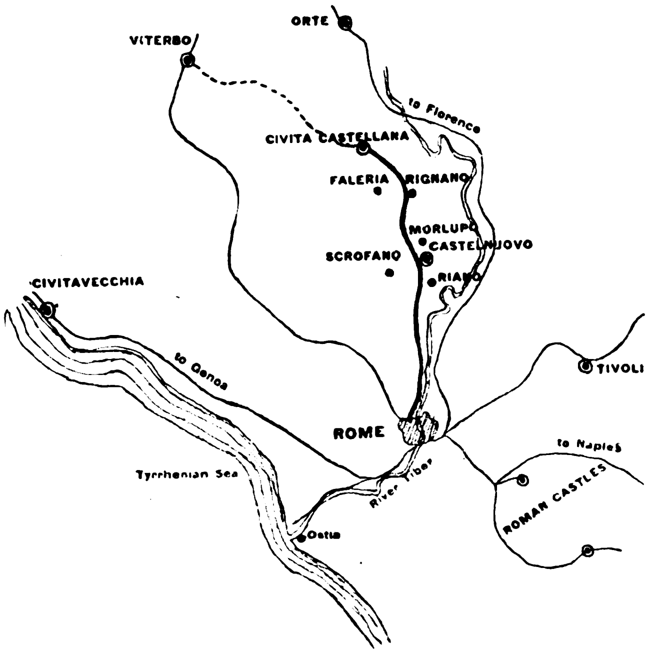

Fig. 1.

Where the traffic is of moderate density and the route long, a motor-car service has proved the more advantageous; but when, with given local conditions, the traffic exceeds a certain limit, electrical traction is found to be the more economical. The success attained by the single-phase motor during the past year has constituted a great step in advance in the field of electric traction, because, thanks to the moderate capital outlay, it is possible to adopt electric traction on many lines which, on account of their great length, would require with direct current working a number of costly feeders, as well as sub-stations and attendants.

In the district between Rome and Civita Castellana there are about a dozen little towns which, so far, have had no means of communication with Rome. Fig. 1 shows the different railways going from Rome to various neighboring places. All these railways are operated with steam engines, with the exception of a line going to the Roman Castles, which is approaching completion on the direct current Thomson-Houston system, and another line, the Roma-Civita Castellana, the construction of which has already been commenced and which will adopt the single-phase system of the Westinghouse Company. A description of the latter may be of interest, as it has been necessary to design for it many new details on account of the high voltage which has been chosen for the trolley wire.

---

*From the "Electrical Review," London.

This line, which will be ready in six months, is nearly 33.5 miles in length; the line, hewever, will eventually reach Viterbo, when its total length will be over 46 miles.

Fig. 2 shows the mountainous nature of the district. Many stiff gradients are met with, including one of 1 in 14 for about ½ mile.

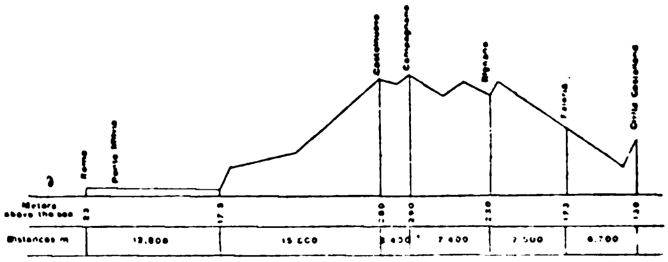

FIG. 2.

The traffic on this line will be conducted as follows: Between Rome and Ponte Milvio, an ordinary suburban service will be carried on with single cars weighing about 12 tons each when loaded; between Ponte Milvio and Civita Castellana, there will be two trains, each weighing about 20 tons fully loaded, and running at an average speed of nearly 15 miles per hour (maximum speed allowed, 22 miles per hour).

The power station will be at Ponte Milvio, 2.5 miles from Rome, and will be equipped with steam turbines of 300 hp. driving single-phase alternators at 25 cycles and 6,000 volts. The line between Rome and Ponte Milvio will be operated at 550 volts, the remaining section at 6,000 volts.

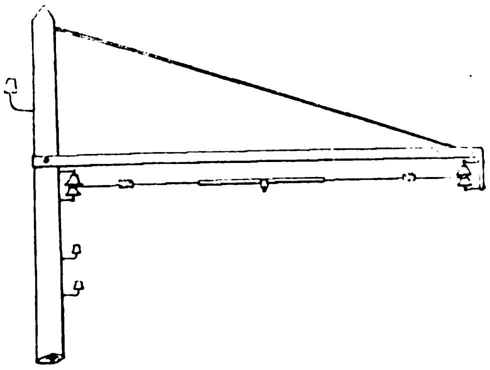

FIG. 3.

The track, which is single throughout the line, has a gauge of 1 meter. The rails are of the Phœnix type, weighing 70 lbs. per yard and 13 yards long, inside the town—say, between Rome and Ponte Milvio—for a length of nearly 2.5 miles. For the other part of the line—between Ponte Milvio and Civita Castellana—rails of the Vignoles type are used, 13 yards long and weighing nearly 42 lbs. per yard. The track is laid down on the existing roadway (the old Via Flaminia), and the ties are of oak of the best quality, 33 inches apart.

Only one side of the track is bonded, with the exception of the part of the line between Rome and Ponte Milvio. The bonds are of the Chicago type, fixed under the fish-plates on the inner side. Each bond weighs about 0.35 lb., and the distance between the two terminals is 8 inches. The bonding is done at the same time as the track is laid down, so as to insure economy and efficiency.

Between Rome and Ponte Milvio, where a pressure of 550 volts is used, there are two No. 00 trolley wires of copper of high conductivity. From Ponte Milvio to Civita Castellana there will be used only one No. 0 trolley wire. The former are fixed in the ordinary way, the latter, which is of a special figure-8 section, is attached to mechanical ears made of steel. As shown in Fig. 3, these ears are fixed to a steel wire capable of resisting a tensile stress of 2,700 lbs.

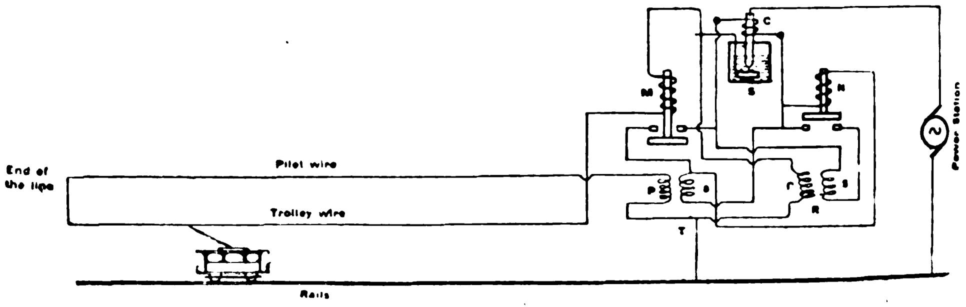

FIG. 4.

Double insulation is provided. The first is obtained by two special porcelain insulators, 5 inches high and 5 inches largest diameter; these insulators are fixed to the bracket arm by means of two bolts, and are tested before delivery up to 20,000 volts. The second insulation consists of two insulators, to the ends of which are fixed with a special cement two hooks for the steel wire; these insulators, before delivery, are tested with 40,000 volts.

The bracket arm is made of two flat iron bars, which are riveted together except at one end, where the bars are forged in such a way as to surround the pole, and are fixed to it with a bolt and nut.

The poles are of chestnut; their sizes are—total length, from 28 feet to 30 feet; top diameter, 5½ inches, bottom diameter, 11 inches. These poles are sunk in the ground to a depth of 5 or 6 feet. On straight track they are about 125 feet apart. Before erection, their lower ends are carbonized on the spot where they are to be erected.

As shown in Fig. 3, on each pole, besides the bracket-arm, there are fixed three insulators. Two of them are for the telephone service, the third for the pilot wire. Since this pilot wire must work at a pressure of 6,000 volts, its insulators have to be of the best quality. The pilot wire referred to is of No. 13 S.W.G., and is required for the actuation of a safety device, which is fixed at the power station.

Furthermore, the current must also be cut off in the case of a short circuit on the line, or of a current flowing in excess of the limits of safety.

Fig. 4 is a diagram showing the system adopted. The apparatus includes an automatic oil circuit breaker S, with its coil C, two electromagnets M and N, and two transformers T and R.

When the line is in its normal working condition, the current supplied to it goes through the electromagnet M, but is not strong enough for operating the latter, which, therefore, always remains open. On the other hand, the transformers T and R have their primaries always connected on 6,000 volts, so that at the terminals of their secondaries there is a certain pressure. Furthermore, the secondary of T is always connected with the terminals of the electromagnet N, and keeps its armature in the "open" position.

Suppose, first, that a short circuit happens on the line; then the electromagnet M, which is in series with the trolley wire, carrying a current stronger than the normal value, draws up the core and closes the circuit through the secondary of the transformer T and the coil C, thus opening the circuit breaker.

Suppose now that the trolley wire or the pilot wire breaks down at a certain point of the line. In this case, as the trolley wire and pilot wire are in series, no current will go through the primary of the transformer T, therefore the pressure at the terminals of its secondary become zero and no current can go through the coil of the electromagnet N. The core of the latter comes down, closes the circuit through the coil C and the secondary of the transformer R, and consequently trips the circuit-breaker.

One of the difficulties of the system described is its application at the turnouts, because if the two wires run in parallel, it is impossible to avoid danger due to the breakage of one of them.

It has been proposed, however, to use the arrangement shown in Fig. 5; by this means the safety of the system is maintained, but the construction of this part of the line requires much care and intelligent supervision.

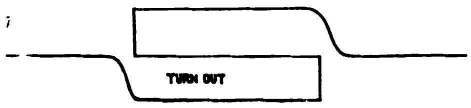

FIG. 5.

The line in question will have no feeders at all, a No. 0 copper wire being sufficient for the whole length with the high pressure used; every three miles there will be placed section insulators which consist of a neutral wire fixed to two or more poles, to which are fixed also the two ends of the live trolley wire.

At the point, however, where the change of voltage has to be effected, the neutral wire has a length of about 40 yards, and there is a special switch which can connect this wire with one or other of the two voltages but never both at the same time. This switch is erected just at the front of the power station and one of the station attendants will be intrusted with its operation.

The lightning arresters for the line will be erected at the places where section insulators are fixed.

The total seating capacity of each car will be about 40 people; the cars will each have four wheels. Each car equipment includes two 40 hp., 250-volt, 25-period, single-phase motors; one main transformer for primary pressures of 550 and 6,000 volts, and for a secondary pressure of approximately 250 volts; reversing switch; motor cut-out; air compressor; air reservoirs; complete Westinghouse brake equipment; and one bow-type trolley for high pressure, operated by compressed air.

The work of construction is now proceeding with great speed and it is generally expected that a portion of the line will be ready for next August.

On April 26 the first stone of the power station was laid in the presence of several Italian Ministers and other authorities, the Belgian bankers, who have provided the capital, and some hundreds of people who are anxiously awaiting the day of the inauguration of the system.

WRINKLES.*

EDITED BY H. C. ABELL.

Method of Protecting Separate Systems of Wiring When Crossing Each Other Without the Use of Guard Wires.

In many cases where high-tension lines cross over telephone and other signal wires, it has been necessary heretofore to erect an expensive system of guard wires. It has been found that the expense of this construction can be dispensed with, by the use of a device that automatically disconnects the wire at a point about two feet out from the cross-arm, so that the piece which falls across the signal wire is dead, and can therefore cause no harm.

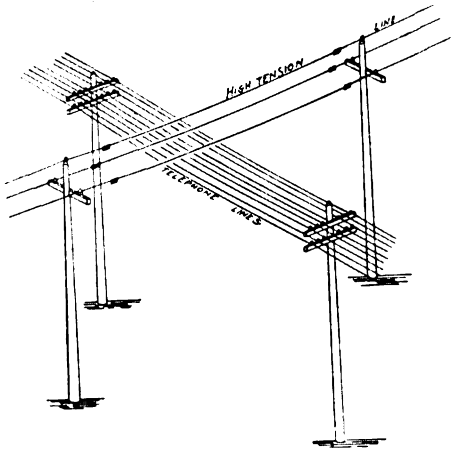

FIG. 1.—LINES CARRYING PROTECTING. DEVICE.

This device consists of a hook, so arranged in the lines that when the tension on the span is released the spring disengages the hook immediately, before the high-tension wire has had time to fall across the telephone line.

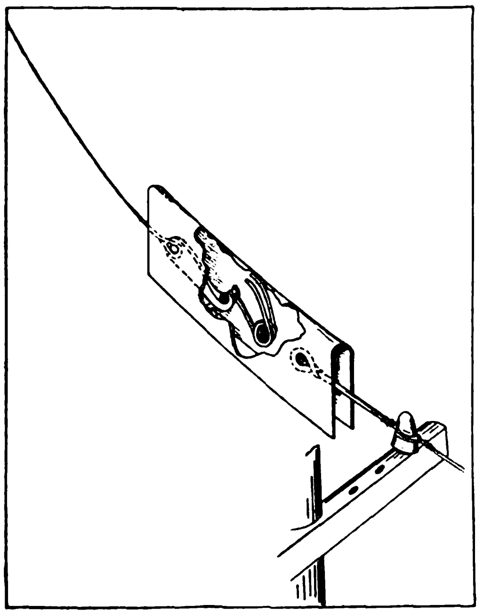

FIG. 2.—DETAIL OF PROTECTING DEVICE.

This hook is placed inside of a hood, which protects it from sleet or ice that otherwise might prevent its action.

The device is also of such a nature that it can be used by telephone companies in places where their wires are above the high-tension wires.

H. B. GEAR, Chicago, Ill.

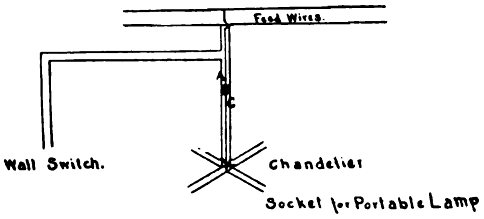
A Handy Chandelier.

The following description shows a handy arrangement for an electric chandelier in a library where a portable electric table lamp is used by connecting it to one of the chandelier sockets.

As most chandeliers are operated by a wall switch, all lamps in the chandelier are either turned on or off at the same time, and as a portable table lamp is often used when the rest of the lamps are not, it becomes necessary to turn off, one at a time, the other lamps when the table lamp is used alone.

By running an extra feeder wire to the chandelier, and a third wire through the chandelier to the socket from which the portable lamp is to be connected, the chandelier lamps and the portable lamp may be operated entirely independent of each other.

The following diagram will serve to illustrate the method of wiring:



CHANDELIER CONNECTIONS.

Care must be taken to get the portable lamp socket connected to wires B and C and not to A and C.

E. A. TAYLOR, Denver, Col.

Doubling the Efficiency of a Steam Radiator.

There are a good many rooms in Chicago apartments where the radiator is too small or the steam pressure too low to maintain a comfortable temperature in severe weather. If the tenant is enjoying the many advantages afforded by central station electric lighting service the matter can easily be remedied.

Take the fan that kept you cool all summer and set it where it can blow against a large part of the radiator's sur face. Turn it on at low speed, or at high speed if necessary, and your cold room will soon be thoroughly warmed.

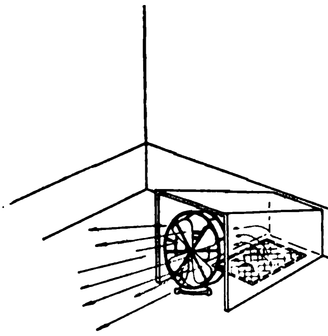
The philosophy of the thing is that

---

*Paper presented before the National Electric Light Association at its 28th convention, held at Denver-Colorado Springs, Col., June 6-11, 1905.

steam at a low pressure carries much less latent heat than steam at a high pressure, and therefore warms the radiator so poorly that only a slight draft of air rises around the pipes, and condensation is slow.

With the fan in operation there is a forced draft against the radiator that conducts a great deal more heat away from the iron, cooling it so that much more condensation of steam occurs inside it. The heat thus snatched from the reluctant radiator is held in the circulating atmosphere of the room, which is soon changed from cold to warm at a trifling cost for electric energy.



The condensation of the steam makes room for more steam to flow in, and the net result is the same as if the pressure was much higher. C. H. Stewart.

THE CHOICE OF AN INSULATED CABLE.*

BY WALLACE S. CLARK.

Every plant generating electric current uses insulated cables—in many cases only for station wiring; in others for its entire distributing system. The company that buys 25 miles or more of cable each year can and does devote a liberal allowance of engineering skill to the selection of the best and most economical types. There are a very large number of plants of moderate size that, with the growth of their business and the increasing tendency to substitute underground for overhead construction, are compelled to increase continually their investment in this line. Some of the points covered in this paper will, I hope, be of value to those responsible for the success of such plants.

The size of the conductor is determined by well-known methods, therefore it is only necessary to emphasize some points usually overlooked. There are two distinct conditions of service. One where the amount of current is not subject to any probable increase, such as instrument, generator and transformer leads; the second comprising all lines outside of the station that may be subjected to increasing loads due to the growth of business.

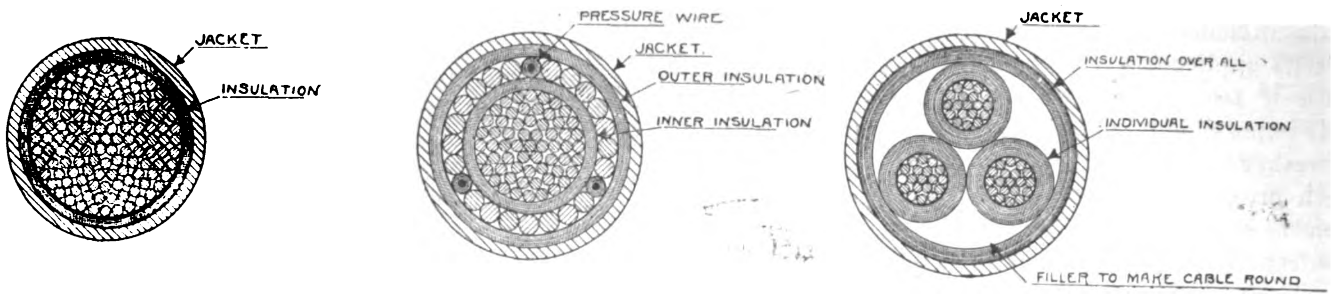


Fig. 1.—Three Cable Sections.

For the first-class ampere (current carrying) capacity, or mechanical strength in the case of small apparatus, is the determining factor. The current-carrying capacities given in the National Electric Code for rubber insulation are a fairly safe guide and the current densities given should not be exceeded.

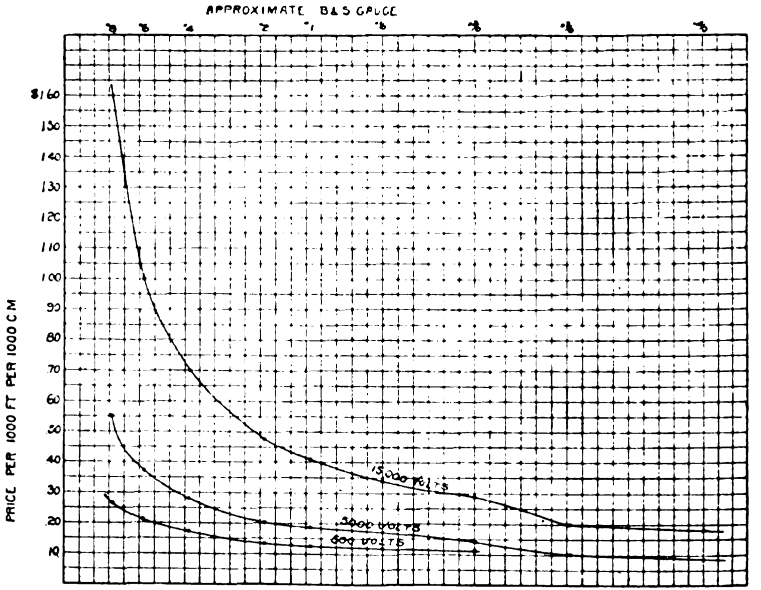

Fig. 2.—Variation in Cost per 1,000 cm. of Copper for Different Sizes of Cable and Different EMF.

For the second class of conductors, the cost of power at the switchboard, the load factor of the line, the limits of loss in transmission for satisfactory regulation of potential and operation of consuming device, the heating of the cable in short lines, the probable increase in load with time and the interest charge on the cable investment are the principal factors in settling the size of conductor to be used. The Thomson law, so-called—that the most economical arrangement is where the cost of the power wasted and the interest charge on the cable investment is a minimum—is the basis of many formulæ elaborated in different books.

Having determined the size of conductor required on theoretical grounds, consideration should be given one or two very practical points. First, do not use for underground construction cables so small as to be mechanically weak. I have in mind a station with a 6,600-volt distribution where the cables ran from three-conductor 0000 to three-conductor No. 6 in size, the No. 6 constituting the smallest part of the installation and giving more trouble than the entire remainder of the system.

Second, if you use a duct system, keep in mind the fact that the cost of duct per foot is independent of the size of the cable in the duct, and select the size of conductors so that the cables will utilize a reasonable proportion of the duct area. Two No. 8 arc-light cables, single-conductor, in a 3-inch duct, costing from 20 to 40 cents per duct foot is evidently uneconomical. The standard 3-inch duct will take cables of the following sizes, insulated for different voltages: Any voltage under 1,500, single-conductor cables up to 2,000,000 circular mils; concentric two-conductor cables up to 1,000,000 circular mils; three-conductor cables up to 500,000 circular mils.

For 3,000 volts, single conductors up

---

*Paper read before the National Electric Light Association at its 28th convention, held at Denver-Colorado-Springs, Col., June 6-11, 1905.

to 1,500,000 circular mils; concentric up to 750,000 circular mils; three-conductor up to 400,000 circular mils.

For 6,600 volt lines, which are practically all three-phase, the limit is found at three-conductor 250,000 cm. cable; 12,000 volt lines, the limit is found at three-conductor No. 0000 cable; on 24,000-volt lines at about 100,000 cm. cable. It is assumed, of course, that the three-conductor cables are run on delta-connected circuits and have the same wall of insulation between conductors and ground as between the conductors themselves. If the three-phase circuit is run Y-connected with neutral grounded, then the outer jacket of the three-phase cable can be made considerably less in thickness and larger cables be installed in the standard 3-inch duct.

Fig. 2 gives some curves showing the variation in cost per 1,000 circular mils of copper contained in the cable for different sizes of cables and different working EMF. It will be noted that the lack of economy in the use of small conductors is most marked in the 15,000 volt class, where changing the size from No. 8 to No. 6 wire increases the cost less than 4 per cent, while the conductivity is increased 58 per cent. Or, taking the larger sizes and going from No. 1 to No. 0, the cost is increased 8 per cent. and the conductivity 26 per cent.

These figures and curves are based on varnished cambric cable, as this type of insulation is roughly midway in price between good rubber cable and good paper cable. With paper insulation the comparison would be less favorable to the larger conductors, while with rubber insulation the use of the larger conductors would show much greater economy.

There is another point especially noticeable in the use of potentials above 5,000 volts, and that is that the safe working pressure for a given thickness of insulation is less in the very small sizes of conductor. Or, to put this in another way, where the thickness of insulation exceeds twice the diameter of the copper core in high-potential cables with homogeneous insulation, we are not able to get the full advantage of the insulating wall, since the fall in potential, or potential gradient, is undoubtedly higher in the layer of insulation immediately adjoining the copper than it is half way between the copper and the outside of the cable; this concentration of pressure tending to break down first the inner layers of the insulation and finally puncturing the entire insulating wall. In short, it is easier to make a 500,000 cm. cable for 10,000 volts working pressure than to insulate a No. 14 wire for the same purpose.

The next point to be covered is whether single or multiple-conductor cables should be used. For station wiring single conductors in separate ducts, or runaways, might safely be taken as the best modern practice. Maximum safety and reliability, and simplicity of arrangement, appear to have settled this question pretty definitely. For outside lines the service will largely decide. Direct current railway feeders are normally single-conductor.

When ducts are high in cost and the load on one feeder is not heavy enough to require a cable utilizing most of the duct space, two feeders may be combined, as long as their course is parallel, in a concentric type of cable if it is desirable to preserve their identities to the switchboard. If it is not important to run the cables as separate feeders back to the switchboard, we may bunch two or more cables by means of a junction box into a single large cable which will run back to the generating plant; as, for instance, three 500,000 cm. cables might be multiplied and a 1,500,000 cm. cable run back to the station. This cable is readily installed in a standard three-inch duct, and there would be a saving in first cost of cable, in duct investment and in switchboard.

For low-tension mains on the three-wire system, either three single-conductor cables or one three-conductor cable can be used. The three-conductor cable is slightly cheaper in first cost but not nearly as convenient for making taps to customers. Theoretically, with alternating currents there is a slight advantage in the use of the three-conductor cable. For low-tension feeders, which usually exceed 250,000 circular mils, in size, the concentric type of cable should be used for maximum duct economy. Smaller than 250,000 cm. cables may be run as a flat twin conductor, and this type of conductor is always advisable for alternating current feeders with manhole transformers. It should be noted here that it is a modern practice, and one to be commended, in running a three-wire system to ground the neutral and run the feeders simply as a two-wire feeders, providing a tree or trunk neutral to which the different points of distribution are connected and which runs back by means of a very heavy cable to the station.

The common practice in arc circuits is to use single-conductor cable. Where a number of circuits are in parallel for any distance an excellent plan is to combine them into a multiple-conductor cable.

(To be continued.)

ELECTRICAL PATENT RECORD.

LETTERS PATENT ISSUED JUNE 13, 1905.

Electric Railways and Appliances.

792,122. System for Transmitting Electric Currents to Cars. John J. Eagan, San Francisco, Cal. Filed Feb. 2, 1905.

792,174 Electric Railway-Switch-Operating Device. Charles W. Squires, Springfield, Mass. Filed May 16, 1904.

792,176 177-178. Power-Driven Trolley-Head and Electrically-Propelled Carrier. William J. Sumner, Holyoke, Mass., assignor to the Coburn Trolley Track Manufacturing Company, Willimansett, Mass. Filed Nov. 14, 1904.

792,279. Electric Block-Signaling System for Railways. Claud D. McPhee, Arnprior, Canada, assignor of one-half to John Carling Kelly, Ottawa, Canada. Filed July 1, 1904.

792,569. Electric Railway. William Chapman and Percy W. Davies, Pittsburg, Pa.; said Chapman assignor to the Westinghouse Electric & Manufacturing Company. Filed Nov. 23, 1897. Renewed April 12, 1905.

Electric Lights and Appliances.

792,076. Electric-Arc Lamp. Robert H. Read, Schenectady, N. Y., assignor to the General Electric Company. Filed Oct. 10, 1902.

792,225. Wall-Plug for Incandescent Electric Lamps. Charles J. Malish, Toledo, O., assignor of one-half to Louis Bergman, same place. Filed Oct. 31, 1904.

Electrical Machinery and Apparatus

792,016. Transformer-Lead. John J. Frank, Schenectady, N. Y., assignor to the General Electric Company. Filed Nov 16, 1904.

792,020. Circuit Breaker and Closer for Alternating-Currents. Andrew Gray, London, Eng., assignor, by mesne assignments, to the Marconi Wireless Telegraph Company of America. Filed Sept. 7, 1904.

792,035. Synchronizing Device. John D. Hilliard, Jr., Glens Falls, N. Y., assignor to the General Electric Company. Filed Nov. 23, 1904.

792,087. Thermo-Regulator for Vapor-Burners. Elihu Thomson, Swampscott, Mass., assignor to the General Electric Company. Filed May 24, 1900.

792,091. Constant-Current System. Matthew O. Troy, Schenectady, N. Y., assignor to the General Electric Company. Filed Dec. 12, 1903.

792,102-103. Alternating-Current Motor and Alternating-Current-Motor Control. Gabriel Winter, Vienna, Austria-Hungary, and Friedrich Eichberg, Berlin, Germany, assignors to the General Electric Company. Filed Nov. 14, 1904.

792,195-196-571. Rotary Mercury Circuit-Breaker and Electric-Motor System. Adolph F. Christmas, Pittsburg, Pa., assignor of two-thirds to Frank R. McFeatters, Wilkinsburg, Pa. Filed Aug. 15 and Sept. 23, 1904.

792,425. Electric Cut-out Box. Anton T. Kliegl and John H. Kliegl, New York City. Filed Aug. 4, 1904.

793,463. Alternating-Current Motor. Leo Schuler, St. Louis, Mo. Filed June 17, 1904.

792,530. Electric Fuse. Norman Marshall, Newton, Mass. Filed June 27, 1903. Renewed May 20, 1905.

Telephones and Telephone Apparatus

792,248. Induction-Coil. George A. Campbell, Newton, Mass., assignor to the American Telephone & Telegraph Company. Filed Oct. 8, 1904.

Miscellaneous.

791,938. Resistance for Rheostats and Electric Heaters. Henry P. Ball, New York City, assignor to the General Electric Company. Filed Nov. 23, 1904.

792,001. Film-Coated Wire. John G. Callan, Lynn, Mass., assignor to the General Electric Company. Filed July 25, 1903.

792 014. Transmitting Apparatus for Wireless Telegraphy. John A. Fleming, University College, London, Eng., assignor, by mesne assignments, to the Marconi Wireless Telegraph Company of America. Filed Sept. 7, 1904.

792 025. Means for Protecting Electric Circuits. John Hamilton, Jr., Boston, Mass. Filed Oct. 16, 1903.

792,052. Electric Telegraphy. Isidor Kitsee, Philadelphia, Pa. Filed March 16, 1905.

792,066. Electrical Harness. William D. McGregor, Slocan, Canada. Filed Dec. 5, 1904.

792,162. Electric Osteophone. La Forest Potter, New York City. Filed June 15, 1904.

792,191. Galvanic Battery. Benjamin J. Blameuser, Chicago, Ill. Filed Aug. 1, 1904.

792,255. Electric Furnace. Francis A. J. Fitz Gerald and Peter M. Benne, Niagara Falls, N. Y. Filed Dec. 3, 1904.

THE TELEPHONE WORLD.

New Independent Company for Ohio.

The formal organization of the Northern Ohio Telephone Company was effected lately with the election of the following officers: President, Willard F. Robison; vice-president, H. M. Perrin, of Maumee; treasurer, James S. Brailey, Jr.; secretary, Charles F. Chapman; directors, the foregoing, together with N. L. Hanson, of Perrysburg; T. H. Tracy, Clarence Brown and M. G. Bloch.

The Northern Ohio is the Independent Telephone Company that was recently formed to take over the exchanges at Perrysburg, Maumee and Whitehouse. It is capitalized at $100,000, and it is the intention to acquire other exchanges in Lucas, Wood and Fulton Counties. The company is owned by the same interests that control the Toledo Home Telephone Company, with which plant it will work in harmony.

Quite a stir was created in telephone circles of Toledo when the fact became known, some months ago, that the Independent had acquired the exchange at Perrysburg. Heretofore this plant, which was practically the key to the rich Wood County oil field, was identified with the Bell interests, but the Toledo Home capitalists secured control of the stock, and thus added a rich feeder to the local plant.

The Bolivar, N. Y., Telephone Company has purchased of George E. DeGolia and others, the Oswayo Valley Telephone Company's plant. It is the intention of the Bolivar Telephone Company to greatly improve the local and toll service of its newly acquired line and to extend the service into several new country districts. The new line will be conducted independently of the local line and will retain the name Oswayo Valley Telephone Company.

About 30 members of the Missouri Independent Telephone Association met recently in Sedalia for the purpose of revising the constitution and by-laws of the association to give greater scope to the Independent companies. President Garry, of Macon, presided, and Frank S. Leach, of Sedalia, was secretary. One of the changes in the constitution will enable the Missouri Association to become a member of the National Interstate Association whenever it may be deemed advisable.

The Superior, Wis., Telephone Company will erect a brick building this summer in which will be installed the company's exchange. The building, according to the company's plans, will be modern in every respect. It will be constructed of brick and stone and is to have two stories and basement.

News from Winnipeg, Manitoba, states that Robert Rogers, minister of public works, recently announced at Melita that Manitoba will take steps to provide for Government ownership of telephones in the province and tax all public franchises. A keen fight with the Bell Company is in prospect.

The office for the new telephone exchange at Oneonta, N. Y., will be one of the most model in the State, and will have accommodations for 3,000 telephones.

Union Pacific to Use Telephones.

The Union Pacific is to operate over all its lines a telephone system for the operation of trains. It will not supplant the telegraph, but will be supplementary. All trains will be equipped with telephones, which can be attached to the wires at any point for use in case of accident.

The company has been experimenting with the telephone for two years, using its telegraph wires to advantage. It works best for short distances, but by means of relays it can be used advantageously over the whole system.

The purpose of the National Interstate Telephone Association, which is the organization of Independent telephone companies of the country, and now holding its eighth annual convention in Chicago, is to effect among the various Independent interests a closer and more militant organization for successfully meeting opposition. The situation in the United States, according to Government reports and other authorities, show the Independents to have 2,500,000 telephones and invested capital of $250,000,000 as against 1,800.000 other telephones and invested capital of $400,000,000.

At the annual meeting of the Ontario & Steuben County Telephone Company, held in Naples, N. Y., a short time ago, steps were taken to greatly enlarge the scope of the company's business by increasing the capital stock to $30.000 under a new corporation. Its once small line has stretched out its arms in every direction, and the demand for its services has forced this enlargement. The number of shares will be increased from 65 to 2,000.

It is estimated that $200.000 in expenditure will be involved in the construction of the new plant of the Independent Telephone Company, of Council Bluffs, Ia. Clarence Judson has been selected as chief engineer of the construction work and toll lines, and he thinks the construction will be completed sufficiently by Christmas to permit the opening of the exchange for business.

Steps are being taken by the City Mutual Telephone Company, of Humboldt, Neb., to practically rebuild its system, putting in a new switchboard, cables, poles, lines, etc,

A report from Bloomington, Ill., states that a syndicate of which Adolph Busch, of St. Louis, is a member, has bought up the Home Telephone property, and will greatly improve the service, especially that part in Normal. It will become a part of the Kinloch Syndicate.

R. A. Nix is putting in a telephone exchange at Montague, Tex. He will also have charge of the long distance to Nocona and Bowie, and the local lines running to Mallard and Dye.

The Corning, N. Y., Telephone Company has opened its new long distance line to Lindley by way of Spencer Hill, Caton and Browntown.

A new law has gone into effect in California, which makes it an offense punishable by imprisonment for anyone to eavesdrop on a telephone line and then discuss the conversation.

Toll Line Clearing House.

At its recent meeting in Des Moines, the Iowa Toll Line Telephone Company decided to incorporate a clearing house company with a capital stock of $10,000. A committee of five was appointed to draft the constitution. The clearing house will be located in Des Moines. The committee appointed was made up of C. C. Deering, of Boone; E. H. Martin, of Webster City; P. A. Holdoegel, of Rockwell City; J. M Plaister, of Fort Dodge, and C. G. Cockerell, of Jefferson.

The representatives of 16 Iowa toll line telephone companies were in attendance at the meeting. The clearing house will make out the regular reports for the companies, saving each one the trouble of making out its own report as well as reports of companies doing business over its line and of those over whose lines it does business.

The deal on the part of the Rochester, N. Y., capitalists to acquire the Syracuse Telephone Company has been consummated. George R. Fuller, manager and treasurer of the Rochester Telephone Company, and a director in the Independent Telephone Securities Company, states that he has acquired options on all the stock of the Syracuse company, with the exception of 150 shares. Thousands of dollars will be spent in Syracuse, and the construction of a new and up-to-date telephone system in that city will unite in one control the Independent telephone interests of Rochester, Syracuse and Utica.

The incorporators of the Coos County, N. H., Telephone Company have organized with the following officers: President, Garvin R. Magoon; secretary, John T. Amey; treasurer, John C. Hutchins. The purpose of this company is to give the people of Coos County better and cheaper telephone service, enlarging the free service circuit so that it will include the entire county. The president, Mr. Magoon, says that prompt measures will be taken towards perfecting the service either by leasing or buying the New England telephones out or by building new lines.

At the annual meeting of the stockholders of the Keya Paha and Brown County Telephone Company, held this month in Ainsworth, Neb., the following officers were elected: President, Charles Hineman; vice-president, Frank Sellors; secretary, F. A. Baldwin; treasurer, R. E. Jones.

The Home Telegraph & Telephone Company, of San Francisco, Cal., it is announced, will construct a line from San Francisco to Portland Ore , to compete with the Sunset Telephone Company.

Telephone Incorporations.

The Wire & Telephone Company, of America, Rome, N. Y. Capital stock, $600,000. Directors: C. F. N. Niles, Toledo; J. S. Dyett, Rome; S. C. Houghton, Syracuse.

The Hammonton Telephone & Telegraph Company, Hammonton, N. J. Capital stock, $125,000. Incorporators: Andrew J. Rider, Samuel Anderson, Marcellus L. Jackson, Richard J. Byrne and L. Frank Horne, all of Hammonton.

GENERAL ELECTRICAL NEWS.

LIGHTING.

Andover, N. Y.—The Andover Electric Power & Light Company, capitalized at $10,000, has been incorporated by R. A. Stout, A. B. Richardson and J. H. Backus, all of Andover.

Ballard, Wash.—The question of electric lights for this city is now being agitated by people living on the outer edges of the city. Many districts are not served with lights, and an effort will be made to have the council contract for more lights.

Burlington, Wis.—A special election will be held to-day to vote on bonds for this city for a $12,000 municipal lighting plant.

Campbellsville, Ky.—The Campbellsville Electric Light Company was organized for the purpose of putting into operation an electric light plant in this city. Dr. J. L. Atkinson was elected president; J. R. Davis secretary and treasurer, and B. S. Kincart, superintendent and general manager. The capital stock has been subscribed, and the company hopes to have the plant in operation by August 10.

Chetopa, Kan.—The proposed waterworks and electric light plant will cost $29,500. No engineer has been selected yet. A. R. Bell is city clerk.

Cleveland, O.—The Cleveland Electric Illuminating Company will erect a sub-lighting station here.

Colma, Cal.—This town will soon have electric lights.

Creston, Ia.—This city will have a new electric light company. The organization was launched with an authorized capital of $50,000. The sum of $21,000 is now subscribed. The following officers have been elected: President, J. C. Sullivan; vice-president, C. S. Rice; secretary, Dr. J. W. Reynolds; treasurer, John Hackett.

Elk Rapids, Mich.—The citizens are about to vote on bonding this city for $20,000, for an electric lighting system.

Murfreesboro, Tenn.—At a meeting of the board of mayor and aldermen of this city a 10-years' contract was made with the City Gas & Electric Company, of which J. H. Nelson is proprietor, to supply lights for that time. The arc light system will be installed without any increase of the tax levy.

Newark, N. Y.—A Philadelphia syndicate headed by E. E. Mandeville, a prominent engineer and electrician, has purchased the electric light plant here for $75,000.

Pana, Ill.—The Pana Gas & Electric Company has been incorporated by T. F. Russell, William Pierce and others.

Prospect, O.—The Prospect Electric Light & Power Company has increased its capital from $10,000 to $20,000.

Santa Ana, Cal.—It is stated that bids will be received by Edward Telford, city clerk, until July 3 for $57,000 electric light bonds.

Smith's Station, Pa.—Penn Grove Park, the well-known camp-meeting grounds here, will be lighted by electricity at an early date.

Van Horn, Ia.—This city is to have an electric light plant.

Yankton, S. D.—After several years of constant discussion, in which municipal or private ownership has been the bone of contention, the city council has taken action and granted a 20-years electric lighting franchise to Sandford G. Donaldson and his assigns, the franchise carrying an option on the part of the city to purchase the plant in 10 years' time at its actual value if it sees fit.

STREET RAILWAYS.

Auburn, N. Y.—The Auburn & Northern Electric Railway Company, which was recently granted a franchise to construct two new trolley lines in this city, is considering the proposition of constructing a trolley line from here to Cayuga.

Baltimore, Md.—The Washington, Baltimore & Annapolis Electric Railway Company has effected financial arrangements for the completion of a double-track electric railway between this city and Washington.

Beatrice, Neb.—A proposed electric line 110 miles long is to run from this city south to Carlton, Kan., where it will connect with the Missouri Pacific. A charter for the road has been asked for, and the capital stock will be $1,500,000. The officers of the road, which will be known as the Golden Belt Railroad, are J. C. Morrow, president; J. E. Brewer, treasurer, and George W. Hanna, secretary.

Bennington, Vt.—The directors of the new electric road from this city to North Adams, expect to have work begun on the line within a short time and to have the road in operation within the year.

Bucyrus, O.—A mortgage for $250,000 has been recorded here, given by the Marion-Bucyrus Electric Railway Company to the Cleveland Trust Company. The railway company is building an electric line from Marion to this city via Caledonia. Several miles of the road has already been graded and a few rails laid. Ellis Bartholomew is at the head of the company.

Canal Dover, O.—An electric line is proposed from this place to Lisbon.

Coffeyville, Kan.—The new electric railroad between this town and Independence, now in process of construction, is expected to be completed and cars running by October 1.

Erie, Pa.—The Corry, Findley Lake & North East Trolley Company will accept the franchise to enter this city.

Gainesville, Tex.—The city council at its regular meeting this month by a unanimous vote granted Judge Hassinger and associates a franchise for an electric line. This is the Gainesville-Sherman Interurban.

Galion, O.—According to announcement made by W. L. Ball, all details for the early construction of the Galion Southern Electric Railway are completed, and work will begin at an early day. The road will run from this city via Frederickstown to Mt. Vernon.

Guadalajara, Mex.—Arrangements are being made for the transferring of the concession for the construction of an electric railway from this city to Chamela, on the Pacific coast, which was obtained by M. C. Miller, of Minneapolis, Minn., to the Jalisco Rapid Transit Company, which is in process of organization. Application for a charter for the company, which will be capitalized at $15,000,000, will be made shortly in the State of South Dakota.

Humboldt, Tenn.—Local capitalists and promoters are interested in another electric railroad from this city to Memphis. The proposed route is via Alamo, Maury City, Brownsville, Phelan, Wrights, Bolton and to connecting points at Raleigh Springs with the electric road to that place. Men of influence and financial ability are behind the movement, and from the assurance already at hand the success of the road is certain.

Indianapolis, Ind.—Plans are being made by the recently organized Huntington, Columbia City and Northwestern Traction Company, to build a line from Goshen to this city by the way of Columbia City, Huntington, Marion, Elwood and Noblesville,

Jasper, Ark.—The proposed electric railway from Fort Smith via this place to St. Joe is now a certainty, and work will soon begin on its construction.

Lander, Wyo.—A movement is now on foot to establish an electric line from Rock Springs to this place.

Millville, N. J.—There is talk of building a trolley road from here to Port Norris by way of Mauricetown and Haleyville.

New Castle, Pa.—The $6,000,000 merger of the Pennsylvania & Mahoning Valley and of the New Castle & Sharon Interurban Electric Lines, is fast nearing completion. The articles of incorporation have been received from Harrisburg. The shares are $10.

Oklahoma, Okla.—Work on the construction of the interurban electric line to connect this city, Edmond and Guthrie, will be commenced here in about two weeks.

Rochester, N. Y.—The New York Central Railroad Company has been negotiating with the Clark Syndicate, owning the Rochester Railway Company, and several suburban lines, for the transfer of all the railroad interests held by the Clarks in this city and vicinity.

Sacramento, Cal.—The board of supervisors has lately adopted a resolution agreeing to sell to the highest bidder a franchise to construct and operate an electric railway along Cypress avenue, in Oak Park, and then down the Upper Stockton Road, for a distance of 1,000 feet. Bids will be opened at the meeting of the board July 8.

St. Joseph, Mo.—Mrs. Alice M. Butler, general manager of the proposed St. Joseph, Stanberry & Northern Electric Line, has signed a contract with a St. Louis Trust Company to advance $566,000, two-thirds of the estimated cost of constructing the line. The remaining third, she says, will be advanced by persons and interests in this city, Stanberry, Des Moines, and other points where she is known. The estimated cost of building the line is $850,000.

Toledo, O.—At a recent meeting of financiers at Lima, the plans for an electric line between Lima and this city were discussed.

POWER PLANTS.

Boulder, Col.—The power plant of the Fourth of July Mining Company was recently destroyed by fire, entailing a loss of $6,000.

Reading, Pa.—Because of the increased demand for power and for illuminating purposes, the directors of the United Traction Company have decided to construct an additional plant of 10,000 hp. along Tulpehocken Creek.

NOTES FOR INVESTORS.

Latest quotations for copper are: Electrolytic, 15@15⅛c.; Lake 15⅛@15¼c.; casting, 14¾@14⅞c.

The Philadelphia Electric Company last week paid out $250,000 in the form of its semi-annual dividend.

At a recent meeting of the board of directors of the Chicago Edison Company the retiring officers were re-elected.

The capital of the Morris County Traction Company of Morristown, N. J., has been increased from $250,000 to $2,750,000.

The adjourned special meeting of the Mexican Telephone Company will be held at the Astor House, New York City, June 29.

It is said that the Keystone Telephone Company of Philadelphia has sold $4,000,000 first mortgage 5 per cent. bonds to a New York syndicate.

The Washington, Baltimore & Annapolis Electric Railway Company has filed a mortgage to secure $1,000,000 second mortgage 5 per cent. 25-year bonds.

The Western Union Telegraph Company has declared the regular quarterly dividend of 1¼ per cent., payable July 15. Books closed June 20 and reopen July 1.

The Bangor (Me.) Railway & Electric Company has made a mortgage to secure $2,000,000 five per cent. 30-year bonds, subject to call at 107½, of which $800,000 are outstanding.

The directors of the Manchester (N. H.) Traction, Light & Power Company have declared a regular quarterly dividend of 1½ per cent., payable July 15 to stock of record July 1.

The Rochester, Syracuse & Eastern (N.Y.) Electric Railroad has filed a mortgage to secure not over $7,500,000 five per cent. bonds redeemable at 110 after 1915. The bonds are for construction.

The American Telephone & Telegraph Company has declared the regular quarterly dividend of 1½ per cent. and an extra dividend of ¾ of 1 per cent., payable July 15. Books close June 30 and reopen July 15.

The Charleston & Summerville (S. C.) Electric Railway Company has made a mortgage to secure $1,000,000 five per cent. 30-year bonds, redeemable at 110, for the construction of its proposed lines.

Trustees of the Boston & Worcester (Mass.) Electric Company have declared a regular semi-annual dividend of $2 on the preferred stock, payable July 1 to stock of record at the close of business June 24. The initial dividend on this stock was declared one year ago, this being the third payment.

First mortgage bonds of the Portland (Ore.) General Electric Company to the amount of $4,000,000, secured by a first and only mortgage on all property of the company, operating under perpetual franchises, are being offered to investors by N. W. Harris & Co. of New York. The company controls the electric light and power business of the city of Portland and surrounding territory.

Kuhn, Loeb & Co. have bought from the Metropolitan Street Railway Company of New York $1,250,000 of its 4 per cent. bonds, the proceeds of which will be used to retire certain bonds maturing in July. The bankers named have, therefore, bought all the bonds of the Metropolitan Street Railway system, from which fact Wall Street naturally is inclined to think they are favorably disposed to that company and the Ryan interests.

COPPER.

The new edition of the COPPER HANDBOOK lists and describes 3,311 copper mines and copper mining companies in all parts of the world, covering the globe, these descriptions ranging from two lines to twelve pages each in length, according to importance of the mines. The descriptions are not padded, but give facts in the most condensed and get-at-able form.

There are also fifteen miscellaneous chapters, devoted to the History, Uses, Terminology, Geography, Geology, Chemistry, Mineralogy, Metallurgy, Finances and Statistics of Copper, rendering the volume a veritable encyclopedia of the subject of Copper and everything pertaining to the metal.

IT IS THE WORLD'S STANDARD REFERENCE BOOK ON COPPER.

Every Miner, Prospector, Investor, Banker and Broker needs the book. Price is $5 in buckram binding with gilt top, or $7.50 in full library morocco, and the book, in either binding, will be sent, fully prepaid, on approval, to any address in the world, to be paid for if found satisfactory, or may be returned, within a week of receipt, and the charge will be canceled. Address the Author and Publisher,

ELECTRIC LIGHTING

VOL. I—THE GENERATING PLANT

By Francis B. Crocker, E. M., Ph. D.

Professor of Electrical Engineering in Columbia University, Past President of the American Institute of Electrical Engineers.

The first edition of this book appeared in 1896, and four editions containing revisions have been published since. The present edition has been practically rewritten, bringing the various branches of the subject thoroughly up to date. The original arrangement of topics and the treatment of fundamental facts are retained, but the earlier types of apparatus have been replaced by the latest examples. Much new matter relating to recent developments in station design, steam turbines, gas engines, direct-connected generators, storage batteries, etc., has been introduced. Particular care has been exercised in eliminating the dead wood consisting of antiquated illustrations and statements, which are too often left in revised editions of technical works. This book has been used for eight years as a textbook in a number of engineering schools, and as a result of this experience the new edition is still better adapted to its purpose. It is also intended as a handbook for engineers and architects, including those not specialists in electrical work, but who desire to obtain information regarding it. "Electric Lighting" is retained as the title, but generating plants for railway, power, electro-chemical and other purposes embody the same elements arranged in a similar manner, so that the book also applies to them. In a general treatise of moderate size it is impossible to cover this subject exhaustively, but the principle, construction and action of each main or auxiliary piece of apparatus, also its relation to others, is explained to an extent proportional to its importance.

ELECTRIC RAILWAYS. PRACTICALLLY TREATED.

By SYDNEY W. ASHE, B. S.

Department of Electrical Engineering, Polytechnic Institute of Brooklyn. Late instructor in electric
traction for the Brooklyn Rapid Transit Company. Associate member of the American
Institute of Electrical Engineers.

AND

J. D. KEILEY,

Assistant Electrical Engineer N. Y. C. & H. RR.

The absence of a modern treatise on electric railways, embodying all the recent developments in electric traction, has encouraged the authors in the preparation of this book. Their aim has been to treat the subject from the theoretical and practical sides. Realizing the immensity of the traction field and the urgency of the demand for information on this subject, the authors have restricted their efforts in the present volume, to the treatment of rolling stock, and have added thereto a chapter treating, mathematically, the speed time and power curves. It is their intention, should the reception of this volume be encouraging, to follow it by succeeding volumes covering the entire field. Much information has been culled from the publications of engineering societies and other sources in an effort to include in the work the most modern of railway data.

CONTENTS:

Units and Measuring Instruments: Mechanical. Electrical. Slide Rule, Planimeter.

Train Performance: Speed Time Curves. Power Curves. Equipment Calculations. Indicating and Recording Instruments. Curve Plotting.

Car Construction: Trolley and R. R. Tractive Force, Resistance, etc. Journals, Axles, Gears, Friction, Car Trucks, Strength, Durability. Lubrication and Testing. Control of Air, Air Pumps, Governors, etc. Brakes, Brake Apparatus, Brake Shoes. Platforms, Gates, Heating.

Car and Train Control: Hand Control. Trolley. Multiple Unit Control. Sprague System. Westinghouse Pneumatic. Sprague-General Electric. Westinghouse Turret or Unit. Switch Control. General Electric Bridge System.

Electrical Equipment: Series Direct-Current Motor. A. C. Single-Phase Motor.

Electric Locomotives: Mining Service. Industrial Service. Trunk Line Service.

Testing: Testing of Equipment. Testing of Electrical Measuring Instruments. Index.

ELECTRICITY.

VOL. XXVIII. NEW YORK, JUNE 28, 1905. NO. 26.

ELECTRICITY.

Published every Wednesday by the
ELECTRICITY NEWSPAPER COMPANY.

Publication Office, - - 136 Liberty St., New York.
Long Distance Telephone, 4021 Cortlandt

SUBSCRIPTION RATES:

United States, Canada and Mexico	$1.00
Foreign Countries	3.00
Single Copies	10 cents

Remit by Draft, Post Office Order, Registered Letter or in Stamps.

Owing to the expense involved in keeping back numbers, papers over two years old will be charged for at the rate of 25 cents apiece.

ADVERTISING RATES.

As ELECTRICITY reaches all classes interested in electrical work, its value as an advertising medium can be readily understood. Rates will be sent on application.

Changes of advertisements should reach the office not later than Saturday morning preceding the day of publication.

Entered at the New York Post Office as second-class mail matter.

EDITORIAL NOTES.

The Subway in Summer.

Before the Rapid Transit Subways in New York were completed a well-known engineer made the remark that the atmosphere in the tunnels would be warmer in winter than the outside air and several degrees cooler in summer. Experience has shown that the air of the Subway is warmer in cold weather, but it has also been demonstrated that it is warmer than the outside air in summer. This is an unlooked for and unpleasant state of affairs, and to make matters worse the air is contaminated by odors emanating from hot oil and grease.

The trouble undoubtedly lies in the ventilating system. Referring to the matter, Mr. Rice, the chief engineer, states that he conducted a careful investigation on his own account and found that the excessive heat was due to the motors on the cars. He says:

"By putting your hand close to the motors on an express train when it reaches the terminal you at once will feel the heat they throw off. Indeed, a person can feel it as an express train rushes past a local station, by placing his hand close to the floor of the platform near the edge. It is like a procession of red-hot stoves rushing past."

The so-called "red-hot stoves" may be responsible for the excessive heat, but only because the ventilating system is at fault. The Rapid Transit Commission suggests installing small refrigerator plants at each station and an experimental plant of this nature will shortly be constructed, probably at the 96th street station.

Plants of this description in connection with electrically-operated exhaust fans may bring relief, but there are bound to be odors in the Subway, especially in summer, until the masonry has had an opportunity of becoming thoroughly dry.

* * *

Are Electric Waves the Cause of Primitive Life Forms?

The study of biology leads us down through various paths to the lowest type of life in existence. It even teaches us that a point is reached where a germ-like cell is all that is left to remind us of the organic architecture of which it forms an indispensable part. According to our most advanced ideas, the human form, as a purely physical entity, in common with all other types of life, is built up, cell upon cell, until the finished structure appears. The cells form aggregations or communities; and it seems to be the peculiar duty of each group to do a certain service for the organism as a whole. One collection of cells form bone, another the flesh, another one organ, another some other organ, until the great scheme is complete. But in spite of the extreme difference in the functions performed by certain kinds of cells they have a common duty to discharge. They hold within themselves that which is called vitality. They take unto themselves the particular elements necessary for their continued growth and existence. They fight great battles on our behalf. Their well being means good health; their injury through neglect, intention or accident means physical evil. They are influenced by the subtle requirements of a nervous system which is itself composed of microscopic cells. But through all cells there is at work a most mystifying, a most incomprehensible force. The cells add to each other, yet not so unduly as to present other than the normal appearance in one species or another. From the top of the ladder of life to the bottom we still find about the same cell. Originally, it was the only one postulating life. Where it came from, how it was developed, are the great questions of the hour.

Dr. J. H. Burke has recently performed some experiments with a test tube of sterilized bouillon exposed to the action of radium rays. He produced what are called radiophobes. They are in many respects identical with the lowest type of cells discoverable with the microscope. They are like living cells and yet unlike them. This is the sensational information imparted to us from abroad. It has given a new stimulus to the question, "Are electric waves related to the primitive life forms?" Are we to believe, in common with the biologists, that a primitive cell arose into being, in obedience to laws and influences of which we are today entirely ignorant. Life is not a chemical accident. It is not anything else but a link in the chain of manifestations. At a time when matter was exposed to the first conditions of creation a pathway was being made for it. Whether these first conditions of creation called into action ether disturbances or not is not the important point. The pivot of all argument rests upon the question asked by science—the question of the influence of certain waves upon organic matter. If Dr. Burke can answer according to the strict requirements of science, then the point of contact has been touched upon which connects an emanation from the most mysterious of known elements with our own world of life. Electricity, biology and physiology are about to meet on a common platform. We must be prepared for wonders both as regards results as well as statements.

* * *

Production of Mica in 1904.

Although mica has been found in commercial sizes in about one-third of the States and Territories, it has been mined during the past year only in North Carolina, New Hampshire, Colorado, New Mexico, California, Georgia, South Dakota and Idaho, which are named in the order of their importance as mica producers.

The total quantity of sheet or plate mica produced in this country during 1904, as computed by Dr. Joseph Hyde Pratt of the United States Geological Survey, was 668,358 pounds, valued at $109,462, an increase of 48,758 pounds in quantity but a decrease of $8,626 in value as compared with a production of 619,600 pounds, valued at $118,088, in 1903. It appears that in 1903 and 1904 the production was nearly 300,000 pounds greater than in 1901 and 1902. This large increase in the production of sheet mica during the last two years is due to the very large quantity of the small-sized disks and rectangular sheets of mica that have been prepared for electrical purposes.

The production of scrap mica during 1904 amounted to 1,096 short tons, valued at $10,854, as against 695 short tons, valued at $6,460 in 1903. During 1903, however, there were also reported 964 short tons, valued at $18,580, which were sold in the rough blocks as produced. This probably made at least 800 tons of scrap mica, so that the actual production of scrap mica in 1903 was greater than that in 1904. Of the 1904 production 610,121 pounds of sheet mica, valued at $100,724, and 200 short tons of scrap mica, valued at $2,000, were produced in North Carolina. This was over nine-tenths of the total production of the United States in 1904.

The imports of mica have, in late years, been several times greater than the home production. This is partly due to the fact that mica from Canada and India, which can be entered at a low valuation, has a tendency to curtail the production of mica in the United States. During 1904, 1,085,343 pounds of unmanufactured mica, valued at $241,051, and 61,986 pounds of cut or trimmed mica, valued at $22,663, were imported into the United States.

UNDER THE SEARCHLIGHT.

Notes and Comments on Various Topics.

Mayor Dunne's idea of getting bids on 100 miles of city railway track has been blocked by the Chicago council. The Chicago Civic Federation has passed a resolution condemning municipal ownership.

A test of the first electric train on the Long Island Railroad showed that a maximum speed of 57 miles an hour was attained.

In an interview in the "Herald" Mr. Thomas A. Edison predicts that "radium is likely to be as cheap as coal one of these days." Discussing the wonders of radium Mr. Edison says: "Its effect on me was the most mysterious that I ever had occur. I found after a time that my eyesight was beginning to trouble me. That was the first symptom. I noticed that whenever I walked along the street and tried to read a sign a little ways off I would see double. After a while I found that every time I attempted to read it gave me a severe headache. This set me to worrying quite a little, as before I always had remarkably good eyesight. Mrs. Edison insisted that I was getting old and needed spectacles. Well, she might have been right about both statements. Anyway, I went to an occulist and had him examine my eyes. They stumped him. He puzzled over the case for a long time and finally confessed to me that he didn't know what was the matter. He said it was the most remarkable eye case that he had ever come across. One eye, he said, was perfectly normal and all right and the other about a foot out of focus. Besides the affliction radium has brought on me my assistant died about a year ago from its baneful effects. It first attacked him in the right hand. The surgeons were obliged to amputate it. Then they had to cut the limb off again at the elbow and still again at the shoulder. Then it attacked his left arm and that was amputated in two places. Then he died. Now when a mineral has such a subtle and untraceable effect as that it is a thing which should certainly be handled with the greatest caution."

Alexander Jay Wurts, Ph. B., M. E., E. E., of Pittsburg, Pa., has been appointed professor of applied electricity and head of the department of electrical practice in the Carnegie Technical Schools. Prof. Wurts will assist in the preparation of a curriculum and the equipping of the electrical laboratory for both night and day scholars in the school of applied science. The appointment takes effect September 1.

The yearly meeting of the American Street Railway Association will be held in Philadelphia in September. The convention will last a week. Messrs. W. C. Ely, of Buffalo, and John I. Beggs, of Milwaukee, were in Philadelphia recently making preparations for the meeting.

President Edgar, of the Edison Electric Illuminating Company of Boston, will soon sail for Europe to make a study of municipal ownership of electric lighting companies as practiced in foreign cities.

The accident to the New York Central's "flyer" at Mentor, O., last week, caused the death of three members of the Engineers' Club of this city—Mr. Wellman, Mr. Morgan and A. L. Rogers. Mr. Rogers was assistant to the president of the Platt Iron Works of this city and Dayton, O., and was well-known as an engineer. He was returning from a visit to the Dayton plant when he was killed. He was 40 years old and lived with his wife and one child at No. 10 Englewood Terrace, New Rochelle.

Annual Meeting of the American Institute of Electrical Engineers at Asheville.

About 200 members were present at the 22d general meeting of the American Institute of Engineers, held last week at Asheville, N. C.

President John W. Lieb, Jr., was the presiding officer, and after calling the first day's session to order introduced Mayor A. S. Barnard, who welcomed the delegates to Asheville by saying "that his city enjoyed new distinction as being the first to be visited in the South by the Institute." He said: "I esteem it a great privilege to meet the members of an organization that is doing so great a work. The South is rapidly developing, manufactures are spreading, and the Institute comes at an opportune time. The work of such organizations is fast obliterating those barriers imagined to exist between this and other sections of the country. The South has not been backward in adopting electrical methods. Asheville was one of the first cities to install an arc-lighting system."

President Lieb thanked the Mayor for his warm welcome and then delivered his annual address. He reviewed the work of the Institute for the past year and made many admirable suggestions for the administration of national engineering societies. He concluded his address as follows:

"It might be observed here that great care should be exercised in the conduct of a society occupied with a specific branch of engineering, that as far as practicable all of its divisions receive due consideration. In an Institute of Electrical Engineering, telegraph and telephone, electric traction and electric lighting, central station and isolated plant, transmission and distribution, design and construction, theory and practice, in fact all branches of electrical engineering, should receive consideration and in the solicitation of papers for the series of meetings held during the year a wide range of subjects should be covered so as to interest and attract the largest circle of members.

"The members at large should have a share in the benefits as well as the obligations of membership whether they be located near the headquarters of the society or at a distance. It is manifest that when the monthly meetings, as well as the more important annual functions, are held at the headquarters of the society, the members at a distance feel that they are at a disadvantage, and there is a tendency to form local clubs or organizations and secede from the parent society, or at least lose interest in it. The Institute has met this situation courageously and through the initiative of Past President Scott a series of local organizations was established and they have been added to under succeeding administrations; these organizations have done much to keep up the interest at distant points, and they have undoubtedly induced desirable accessions to the membership and have been an important stimulant of professional activity.

"Sister societies are facing the same problem and are watching the result of our undertaking—it can no longer be called an experiment—with great interest. But this scheme of local organizations while undoubtedly successful, is developing new problems and new conditions and requires the constant care and supervision of the central administration."

On motion of Mr. Calvin W. Rice the Secretary was directed to bring the address before the board of directors at the first September meeting.

The reading of the following papers was then called for by the President:

"High-Potential Oscillations of High Power in Large Power Distribution Systems," by Charles P. Steinmetz.

"An Experimental Study on Commercial Transmission Lines of the Rise of Potential Due to Static Disturbances Due to Switching, Grounding, etc.," by Percy H. Thomas.

Both papers were discussed by Messrs. H. G. Stott, P. N. Nunn, F. A. C. Perrine, S. M. Kintner, President Lieb and Dr. Samuel Sheldon.

Mr. P. N. Nunn, of Niagara Falls, held that generators, transformers and switching gear had now reached a state of great perfection and were more reliable than corresponding steam apparatus, but the transmission lines were not reliable and were lamentably far behind. No one knew the conditions obtaining on them exactly from moment to moment of the varying operations of the plant. When approached by capitalists to recommend very long transmission lines, he felt it better to be perfectly frank in stating that at present such work was to a great extent unreliable and experimental.

The next paper read was on "The Constant-Current Mercury Arc Rectifier," by Charles P. Steinmetz. The author said he had written the paper purely from an engineering standpoint and not on a metaphysical basis, and had found that he could treat the subject as a pure problem of the arc, without relation to theories.

The paper was discussed by president Lieb and Messrs. J. W. Howell, Dr. E. F. Northrup, P. H. Thomas and F. A. C. Perrine.

During the morning and evening sessions the following papers were read:

"Experimental Data Relating to Conductors and Underground Electric Cables," by Henry W. Fisher.

"Methods of High-Pressure Measurement," by S. M. Kintner.

"Some Comments on Remarks Made by Col. R. E. B. Crompton before the International Electrical Congress at St. Louis," by John W. Howell.

"The Preservation of Southern Streams —A Forest Problem," by C. E. Waddell.

"Three-Phase Traction," by F. N. Waterman.

"Heavy Electric Freight Traction," by C. De Muralt.

"Weight Distribution on Electric Locomotives, as Affected by Motor Suspension and Draw-Bar Pull," by S. T. Dodd.

"Choice of Motors in Steam and Electric Practice," by William McClellan.

"Electrical Features of Block Signaling," by L. H. Thullen.

"Limits of Injurious Sparking in Direct-Current Commutation," by Thorburn Reid.

"A Study in the Design of Induction Motors," by C. A. Adams.

"Limitations in Direct Current Machine Design," by Sebastian Sonstius.

"A New Instrument for Measuring Alternating Currents," by E.F. Northrup.

A brief discussion followed each paper as read. In the discussion on Mr. Howell's paper he claimed that tests showed that British lamps were found not to be equal to lamps of American manufacture.

The members and their friends enjoyed a number of trolley rides and the reception and ball was largely attended.

A banquet was given in the main dining room of the Battery Park Hotel. Mr. T. Commerford Martin acted as toastmaster. President Lieb and Mayor Barnard delivered felicitous speeches, and the following were the toasts:

"The Institute," Dr. S. S. Wheeler; "Theory and Practice," Dr. C. P. Steinmetz; "Technical Institutions," Dr. Samuel Sheldon; "Industrial Development of the South," Mr. John H. Finney, of the local committee; and "The Utilization of Natural Resources Through Electricity," Dr. F. A. C. Perrine.

The Railway Electric Power Company will use the Ganz system of three-phase, alternating-current electric traction.

ALTERNATING-CURRENT MOTORS IN INDUSTRIAL SERVICE.*

BY P. D. IONIDES.

The industries most generally requiring variable-speed motors having a wide range of speed are those connected with the making of paper, printing, dyeing and bleaching. In some cases the speed variation required is so wide and so gradual as to preclude the possibility of using induction motors, and until the recent development of the single-phase series motor there was no alternating-current apparatus which could meet these requirements. In the majority of cases, however, the requirements of speed variation can be met by the use of induction motors of either the squirrel-cage or slip-ring type. For paper calenders the usual requirements are (1) the dead slow speed for threading in the paper; (2) minimum speed for calendering certain classes of paper; (3) top speed for calendering other classes of paper.

These requirements can be met in the following manner: There is a small auxiliary motor driving the main motor through a worm gear and free wheel clutch, so as to give the required slow speed for threading in. The main motor is wound and connected to a controller of the tramway type, so that the coils of the stator can be grouped to form eight poles, at which the medium speed would be obtained, or four poles, at which the full speed would be obtained. In this particular apparatus the supply is at 25 cycles, and consequently the speeds of the motor are 360 and 720 revs. per min., making the usual allowance for slip. The changing from dead slow to half speed and from half speed to full speed is obtained by means of tappings from a pair of auto-transformers and a number of notches on the controller, whereby a gradual increase in voltage is applied to the motor as the controller is moved from notch to notch. This insures an even acceleration, and prevents any tearing of the paper. It would have been equally feasible to have wound the motor with 12 and 8 poles, so as to give three-quarter and full speed, or other combinations. The controller is placed remote from the motors for the convenience of the operator, and all movements are controlled by one handle. The whole apparatus is no more costly than direct-current apparatus to accomplish the same results would have been, and the operation is equally satisfactory.

A modified form of the arrangement just described for paper calenders can be used to great advantage on other classes of work; for example, in the driving of air compressors or hydraulic pumps. In this arrangement the motor is wound for two speeds—i. e., tappings are brought out from the windings so that the coils may be grouped to give full speed and half speed, or full speed and three-quarter speed, as the case may be, and connected to a double-throw switch, which when thrown in one direction will give the full speed, and in the other direction will give the half speed. This switch can be controlled either mechanically or electrically to regulate the speed of the motor to suit the demand. This arrangement is as simple, or even simpler, than any direct-current device to give corresponding changes in speed. A still simpler form of this speed-changing device can be used on squirrel-cage motors employed to drive machine tools and punching and shearing machines, where different speeds are required, and in this case the switch, which changes the grouping of the coils in the motor, is simply operated by hand. As an example—a 10 hp. motor used to drive a punching and shearing machine. For very heavy work the motor is required to operate at about 75 per cent. of the speed at which lighter work could be done. To meet this requirement, the tappings for the grouping of the coils should be so arranged as to give three-quarter or full speed. If half speed and full speed are required, the tappings could be arranged accordingly. The output of the motor is varied in direct proportion to the change in speed—i.e., a 100 hp. motor at 480 revs. per min. will give 75 hp. at 360 revs. per min. and 50 hp, at 240 revs. per min.; but the efficiency at any of these speeds is as high as it is possible to obtain within a very small percentage. As the power required to drive most machinery varies directly as the speed at which it is driven, the output of the motor corresponds very nicely with what is required of it.

The foregoing examples all deal with classes of work where certain fixed speeds will meet the requirements, and all that is necessary is the gradual acceleration between the fixed speeds, but there are other classes of work where it is necessary for the motors to have a speed variation of perhaps six or eight to one, with the possibility of being able to run continuously, and with high efficiency, at any intermediate speed. This requirement is principally found in connection with paper-making machinery, and in some cases with calico printing, bleaching and dyeing. The only electrical apparatus which can accomplish this result has, until recently, been the shunt-wound direct-current motor operating on two or more voltages, so as to give the required range of speed. The direct-current apparatus for this purpose has always been more or less expensive, and difficult to design. The single-phase series motor offers a method of accomplishing this result which is simpler and more efficient. For this purpose the apparatus will consist of a single-phase motor controlled by an induction regulator, which is a boosting transformer placed in series with the motor. This regulator or transformer raises or lowers the voltage, depending on the relative position of the primary, which is moved in relation to the secondary by means of a worm wheel and worm. Any required voltage from zero to full-line pressure can be applied to the motor, and consequently any required speed can be obtained. The losses in the induction regulators are simply the magnetization and C^2R losses. It will thus be seen that the arrangement is not only very efficient but provides for a range of speed variation in five shades which cannot be approached by any continuous-current device, unless it be very elaborate and costly. For variable-speed work, where contact stopping, reversing and starting again is required, both the squirrel-cage motor and the slip-ring motor may be used. With the former, the control is effected by applying different voltages to the primary by means of auto-transformers and a controller. For this service the resistance in the secondary should be increased so that the maximum torque is obtained at zero speed. This is accomplished by constructing the end rings, to which the bar windings are bolted, of metal having a higher resistance than that used in the construction of a constant-speed squirrel-cage motor. The torque of this motor varies as the square of the EMF. applied to the primary. This applies to the torque at all speeds—i.e. EMF. = 100 per cent., torque = 100 per cent.; EMF. = 90 per cent., torque equals 81 per cent.; EMF. = 80 per cent., torque = 64 per cent., and so on. By means of the auto-transformers and the controller, any voltage can be applied so as to give the required torque and speed. With the slip-ring motor, the control is effected by varying the resistances in the secondary circuit of the motor, and this method of control corresponds to inserting resistances in the armature circuit of a shunt-wound motor.

For overhead traveling-crane work, the squirrel-cage motor pessesses some advantages over the slip-ring type, in that three wires only need be led to each motor, and if three motors are used on the crane, one wire may be common to all three motors. Again, one set of auto-transformers can be used in conjunction with the three controllers for the control of the three motors, provided the capacity of these auto-transformers is equal to the maximum demand which will be made by the three motors. For operating winches, live rolls and work of this class, the slip-ring motor is preferable for the reason that, in the first place, the starting currents are not so heavy, and, in the second place, the currents handled by the controller are all in the secondary circuit, and consequently at a low pressure, which results in less burning of the contacts.

ELECTRICITY LEAFLETS.

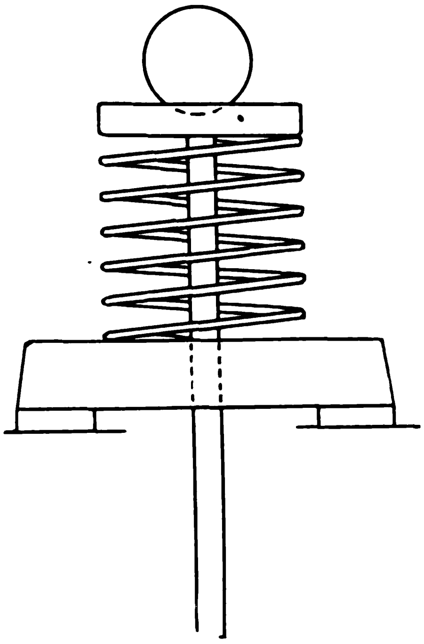
BY NEWTON HARRISON, E. E.

THE TRANSMISSION OF POWER.

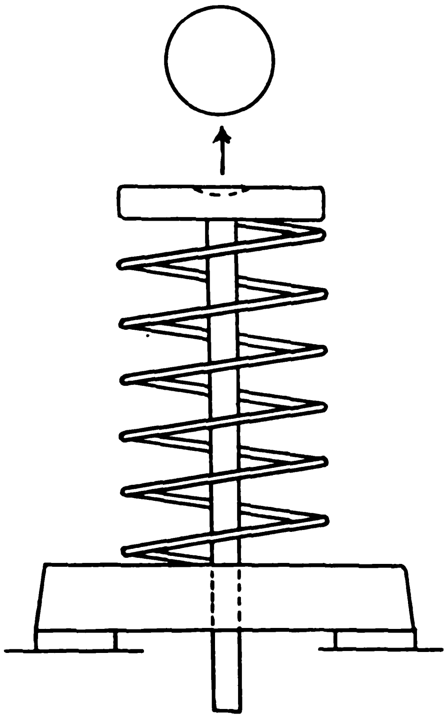
Definition of Power Transmission.—The phrase is self-explanatory, in that it refers to the *transmission* of power; the development of power at one point, and its delivery at another distant point. While the term power might be popularly considered with respect to this subject as a useful form of energy, it is evident that the new expression *energy*, equally metaphysical, takes its place. In order to clear away any misconceptions that may arise in connection with this subject, it is deemed advisable to give explicit definitions of the words, force, energy, work, power, machine, efficiency, etc.

Force Defined.—According to the Newtonian definition, force is that which moves or *tends* to move a body from a condition of rest to motion, or from a condition of motion to rest. There are two types of forces: those which act upon a body from without, and those which act upon a body from within. The first class are called external forces, the second class, molecular forces. Under either or both of these influences the phenomena of nature are produced in the organic as well as the inorganic world. Other expressions, such as muscular force, intellectual force, vital force, etc., relate to the force emanating from the muscles, developed by the brain or body as indicated.

Energy Defined.—Energy is defined as the power of doing work. A moving body which overcomes resistance displays energy. The amount of energy it displays depends upon its speed of motion or velocity and its weight. There are two kinds of energy—kinetic and potential. Kinetic energy is due to motion, potential energy to position. The latter is more generally interpreted as the power of doing work. When it is said that a thing possesses potentiality, a certain capacity or possibility is expressed. Potential energy resides in gunpowder or dynamite. It is the only form of energy possessed by a body high in the air at the instant before falling. In this case the potential energy is rapidly transformed into kinetic entirely through the influence of position. Water in an elevated reservoir presents the same case. The vapor of the clouds at the instant before condensation, or the liquid possibilities of the waterfall one instant before moving or falling, being merely an instance of potential energy, but instantaneously a striking illustration of developed kinetic energy. It must be remembered, however, that in the case of a falling body, at every point in its downward path, potential energy is undergoing transformation into kinetic. The cessation of potential energy is rapidly proceeding, that is to say, the kinetic energy is increasing in a falling body but the potential energy is diminishing. This represents a case of the energy due to position being transformed into the energy of motion. For this reason the reverse can be expected, the transformation of the energy of motion into that of position. This case appears in a body projected high into the air, the kinetic turns into potential energy; if permitted to fall it is retransformed again into kinetic.

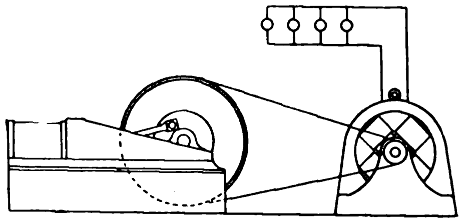


Potential energy of a spring.

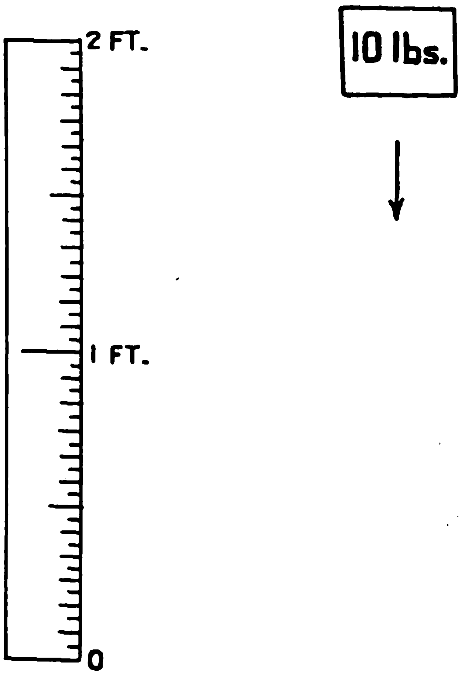


Kinetic energy of a spring.

Work Defined.—When motion is produced against a resistance work is done. The act of doing work is really the act of developing energy to accomplish a purpose. This idea presupposes some resisting influence. It may not be limited to visible results though the popular conception of the meaning of the word calls for such. In a mechanical sense, work means the employment of certain forces to perform certain operations. The tides, the wind, the power of steam, water, gas or electricity are utilized to

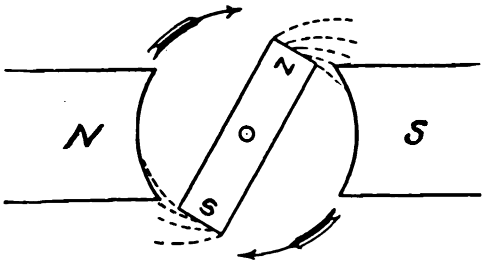


Work done by an engine.

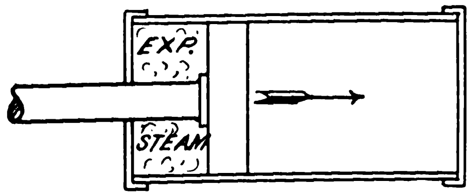


Twenty foot pounds developed.

do work. This work may consist of lifting, or moving plates along a horizontal plane. It may mean the application of forces to perform a service at a distant point. The measurement of work is made in foot pounds. A foot pound is the amount of work done in lifting 1 pound 1 foot against the force of gravity. According to the French system in which the kilogram, a weight of about 2.2 pounds is employed, and the meter, a distance of more than a yard, a kilogram meter is the unit.

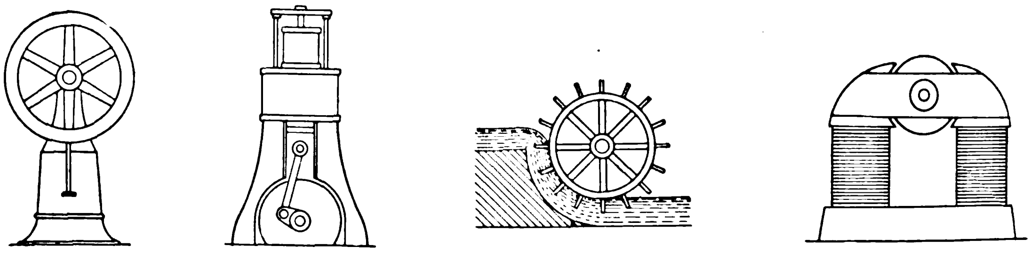


Magnetism producing motion and power.



Steam producing motion and power.

Power Defined.—The force applied to a machine is called the power. The expression power is also used in relation to the amount of work that is being done in a certain period of time. A horse power, for instance, is the rate of doing a given amount of work per minute or per second. It is given as equal to 33,000 foot pounds per minute. By this is meant that a weight of 1,000 pounds lifted 33 feet in a minute, requires 33,000 foot pounds to perform this effort. It also means that any rearrangement, such that the weight is greater or less, or the distance greater or less, which when multiplied give 33,000 foot pounds, represents a horse power. The element of time must be considered, otherwise the rate at which the power is being produced cannot be estimated. The time need not necessarily be a minute; it may be a second during which power may be used. In this sense, power may be rated according to its amount at any instant. An effort of a horse power may last only through a second, in which case one-sixtieth of the power is manifested. The 33,000 foot pounds a minute may be 550 foot pounds a second, or 55 foot pounds for a tenth of of a second, etc. The rate at which power is produced to do work, with respect to a given standard illustrates this idea. A steam engine, a gas engine or a motor are rated according to this basis. They are built to produce power at a certain rate per second or per minute. This determines their horse power and governs the statement made with respect to such an output. A motor, which is a machine in which electricity is transformed into mechanical energy is rated by the second, a steam engine by the minute. But if a 10 hp. motor or a 10 hp. engine are compared with each other, it will be found that each produces 330,000 foot pounds per minute or 5,500 foot pounds per second. The volts and amperes required for the electrical machine, and the quantity of steam and pressure required for the steam engine are simply different forms of power. In the first case, the electricity is transformed into magnetism through which a push and pull is developed in the motor, causing rotation. In the second case, steam is expanded in the cylinder of the engine, and while thus expanding, transmits its power to the piston which in turn rotates the flywheel. The results are the same though the means employed are different.



Gas Engine. Steam Engine. Water Wheel. Electric Motor.

Machines Developing Useful Mechanical Energy.

A Machine Defined.—If using explicit terms, a machine would be defined as a device by means of which force is able to produce an effect. It is to be understood, in the majority of cases, that the machine does useful work, though this is not necessarily required of it. The force applied to the machine is called the power. A distinction is made at times between a machine and a motor. In some instances a motor is regarded as the source of power, but in a purely mechanical sense. The power of this motor is the cause of motion. A motor, from this standpoint, may be the expansive force of steam, the effort of the muscles, the impact of the wind, or the explosive force of gas. Although the term motor is applied to a machine which transforms electricity into mechanical power, it is easy to understand that its most authoritative use would be made when the expression is applied to the electricity itself. Adopting the common phraseology, however, with its accompanying meaning, the word motor is applied to any machine which transforms energy into mechanical motion. The broad application of the word energy is here made, according to the most advanced ideas of physicists. Electricity is a form of energy; steam or gas another phase of its existence. The machines through which electricity, steam or gas can be transformed, so that their respective powers can be utilized, are very different from each other. They represent, as it were, a channel through which their agencies can operate. The agencies differ, but their mechanical results are alike. If, in operating through a machine, one form of energy is more readily convertible in mechanical motion, or into the other form of energy required than another, it is said that a higher efficiency results.

Efficiency Defined.—The engineer deals with the problem of efficiency from a commercial as well as a scientific standpoint. The commercial considerations involved are such that it does not pay to gain a high efficiency at too great an expense in construction. The scientific considerations involved are such that it is useless to experiment unless there is an absolute reason for seeking more advantages. The laws of nature on the one hand, and the influences governing supply and demand on the other hand, exercise control. Efficiency in a device is expressed by the ratio between the power taken out and the power sent in. For instance, if an electric motor develops 8 hp. and an amount of electrical energy equal to 10 hp. is sent in the efficiency would be the ratio of 8 to 10 or $\frac{8}{10}$, equal to 80 per cent. If other intermediate devices lie in the path of the incoming energy, they must be considered in connection with the machine receiving the power. In other words, the net result in energy obtained, must be compared with the sum of the energy applied, in order to institute a relationship called efficiency. In power transmission, the efficiency is the most prominent feature under consideration. A choice of power transmission methods is guided entirely by the efficiency in prospect, and the cost due to such an installation.

Methods of Transmitting Power.—Although modern science and engineering have demonstrated that the electrical transmission of energy is by far the most efficient method in existence, it must be remembered that other methods have been tried very extensively with varying degrees of success. Power can be transmitted by means of steam, compressed air, water, wire rope or electricity. It can be transmitted in some other forms as well, but they cannot receive consideration on account of their impracticability. In Manhattan Borough of Greater New York, steam pipes extend over a distance of several miles, from one end of the city to the upper section. The steam is used for heating or for power as required. It may be stated that its utilization of power is very limited in comparison with its use for heating. In this respect, the manner in which the power is distributed along the route is indicative of the fundamental difference between the transmission and the distribution of power. The same practice would be carried out in the case of pipes carrying compressed air. In Paris a system of this kind met with general success for a while. It is not employed for the transmission of power between points widely apart. It really represents a case of the distribution of power, and over short areas is used quite extensively. In mining, compressed air is of great service because of the supply of pure air a method of this kind guarantees. In private homes it would also find a place. Cool fresh air in hot weather would find a ready sale if directed into rooms escaping the influence of brisk circulation. In the same sense water under pressure could be readily converted into power by means of small water wheels. It has been employed for this purpose in the past. It is not a very good method where distances are great between the points of application of the power and the generation. Wire rope transmission belongs to a category all by itself, yet it only emphasizes the principle of conveying power from point to point by means of a medium possessing a great inertia, weight, friction, etc., in comparison with one entirely different in character. A wire rope moving over a distance of several miles cannot be very efficient. The friction, inertia, weight and repairs are naturally great. It has been estimated that the comparatively recent cable systems in New York and Chicago barely reached the figure of 20 per cent. efficiency. Out of every 1,000 hp. developed only 200 proved effective. The same sized copper conductor as that employed as a steel wire rope in cable service would transmit more than 50 times as much power in the form of electricity. Wire rope transmission is highly inefficient over comparatively short distances. Over long distances, such as 10 miles, the wire rope, compressed air, water or steam methods of power transmission would prove commercial failures.

Character of the Electric Power Transmitted.—There are two kinds of currents which may be transmitted over long distances. One is called direct and the other alternating. The transmission of a high tension *direct current* is attended with difficulties which are almost insuperable objections to its use. The alternating current in a modified form seems to be particularly adaptable to long distance power transmission. The character of the electric power transmitted is thus the solution of the problem, if due consideration is given to the machines necessary to make such an enterprise a success. The reasons why direct current cannot be employed are first insulation, second transformation, and third cost of installation. They might be summed up in the phrase, insulation, transformation and installation. On the other hand, where an alternating current is employed for long distance transmission the insulation problem is readily met in the transformers employed. There is no necessity for revolving parts developing a high potential. Transformation from a high to a low potential or vice versa, or from alternating to direct, is readily and in many respects cheaply as well as efficiently accomplished. The cost of installation is much less with alternating current generators than with direct.

The alternating current employed for long distance power transmission is not the ordinary single-phase current, but a two or a three-phase current. A two or three-phase current is employed because it makes an appropriately constructed motor self-starting. This fact is of importance in the further transformation at the end of the power circuit of alternating into a direct current.

THE CHOICE OF AN INSULATED CABLE.*

BY WALLACE S. CLARK.

(*Concluded from page 355.*)

This saves in first cost, in cost of installation, and in cost of ducts. If a number of small leaded cables are run in one duct, which is necessary in order to keep the duct investment reasonable for the arc circuits, one cable burning out in a duct is very likely to injure the others. Further, the cables are liable to mutual injury when being installed, and it is quite difficult to draw out one cable without damaging the others. These are defects that may be avoided if a multiple-conductor cable is used.

Single-phase two-wire lines not exceeding No. 0000 size should be run as twin conductors unless numerous taps are made, in which case the greater convenience in making joints may justify the use of the single-conductor cable. The concentric type of cable for single-phase work is losing favor in England and on the Continent and has never been in favor in this country. The most serious objection is that in a large network of concentric cable on single-phase or three-phase alternating circuits, great care is required in switching, since the outer conductor has a very much higher electrostatic capacity to earth than the inner conductor, giving rise to surging of the voltage and current and to burn-outs. For three-phase work, three-conductor cables, and for two-phase (quarter-phase) four-conductor cables are required, both on economic and engineering grounds.

Types of Insulating Material for Different services: (a) Station Wiring.—I believe the majority of engineers who have had experience in central-station construction now consider that cables without metallic sheaths are better than leaded or other metal-sheath cables for this class of work. The lead sheaths are generally grounded, and must be grounded in a high tension system to prevent the accumulation of static charge. These grounded lead sheaths offer the arc from any conductor to earth in their neighborhood a ready inducement to spread and cause trouble on adjoining cables. The lead sheath on circuits exceeding 5,000 volts, and on all voltages if the cable is paper or fibrous insulation, must terminate in an end bell or pothead to prevent the breakdown of the cable at the terminus of the lead sheath. This end bell in addition serves as a seal to prevent the absorption of moisture in the case of paper or similar cable.

Cables for tensions not exceeding 750 volts that can be run in dry non-metallic ducts without pockets where water may collect, or on suitable incombustible insulators—porcelain, glass, slate shelves, concrete, etc.—require insulation only to prevent shocks to operatives and short-circuits due to mechanical causes, such as a workman dropping a wrench or bar across two bare conductors. An excellent type of cable for this work is one insulated with varnished cambric tapes and asbestos (asbestos being on the outside), finished with a flame-proof braid. Such a cable can be operated continuously at the boiling point of water without injury. The varnished cambric, being inclosed in asbestos, does not introduce any additional fire risk, as do weatherproof or rubber cables. The rate of deterioration is less than with other types and the cost low. The first use of this type on a large scale was in the Harrison street station of the Chicago Edison Company in 1893. Since then they have been largely used in station practice and have never given any trouble; they have in one or two cases come through fires practically uninjured.

---

*Paper read before the National Electric Light Association at its 28th convention, held at Denver-Colorado-Springs, Col., June 6-11, 1905.

For pressures of 1,000 volts and upward we must use rubber cables of good quality, or some satisfactory substitute. Such cables, unless protected by individual fireproof runways, should be protected on the outside by an asbestos jacket. This jacket will prevent fire following along the cable or bunch of cables; it also acts as a protection, to a considerable extent, from the destructive action of an arc from an adjoining conductor.

If rubber insulation is used it should be of good quality, and such cables cannot be cheaply made owing to the present extremely high price of the better grades of crude material. Rubber cables should not be operated at temperatures exceeding 125 degs. F. if reasonable long life is expected of the insulation. Lower operating temperatures are most desirable, as they will do much to prolong the life of the insulating wall. Higher temperatures cause very rapid deterioration of the insulation. In England, and to a less extent on the Continent, various patented compounds, made usually from oils and bitumens, have been tried, and with fair success, on low-tension work, and where they were not subjected to any high degree of heat. These cables are not adapted to the high temperatures that prevail during summer in most stations, nor will they give satisfaction when run at the high-current densities common in this country. The best that can be said of these insulations is that they are more or less successful imitations of vulanized rubber and generally have all the faults of rubber insulation more or less exaggerated.

You are all no doubt familiar with the large use of oil varnish films in the insulation of electrical apparatus such as transformers, generators, motors, etc., usually used in combination with some woven fabric to give mechanical support to the film. Six years ago, after extended experience with this type of insulation, the company with which I am connected became convinced of the value of the insulation for cable work, especially on cables of large size or for very high voltages. The insulation developed consists briefly of cloth tapes especially treated and coated on both sides with multiple films of varnish. These tapes are applied to the cable and between the tapes is a thin film of plastic insulating material which does not dry or become hard. The function of this plastic layer is to increase the flexibility of the cable by allowing the tapes to slide one upon another when the cable is bent. Cables thus insulated are tested and finished the same as rubber-insulated cables with braid, lead or any other desirable finish.

This type of insulation has all the good qualities of paper cables. It will withstand as high temperatures; it is more flexible; has a considerably higher dielectric strength; and finally, most important of all, does not absorb moisture and can be used in interior work without a lead jacket. The varnish and cambric insulation, which I will speak of as V. C. for the sake of brevity, will not decentralize or deteriorate under temperatures destructive to rubber insulation. Mineral oil will not rot it. So far as data are obtainable, its rate of deterioration is less than that of vulcanized rubber of the best quality under like conditions. Its dielectric strength is fully equal to that of rubber insulation. The method of manufacture is one insuring a homogeneous insulation of uniform dielectric strength—a point extremely difficult of attainment in rubber-insulated cables for high voltages. This type of insulation, I believe, is especially suitable for station wiring in the higher potentials and larger sizes of cables. It lacks only one quality to make it approach very near the ideal—it is not in itself fireproof, neither is rubber nor paper. Like rubber-insulated conductors, it may be flame-proofed with asbestos on the outside, or, in fact, with any available material that can be used over the other insulations. It has not as yet been applied to very small conductors for potentials below 1,000 volts; for these, rubber is at present the best available insulation. For small conductors for high tension an inner wall of rubber and an outer wall of varnished cambric makes an extremely effective cable and one much cheaper than cable built entirely of rubber.

Passing to conductors outside of the stations, these may be roughly divided into transmission lines, practically always operated at potentials of 4,000 volts or more and running to sub-stations. The second class of cables comprises the distributing systems with feeders seldom exceeding 3,000 volts and mains to which customers are directly connected operating at 500 volts or less. Circuits outside of the station using insulated cables are practically all underground. There are a few cases where high-tension leaded cables are run on pole lines supported by a steam cable similar to telephone practice, but this may be regarded as a temporary expedient.

Underground construction in this country consists almost entirely of lead-jacketed cables in conduits, the most permanent type of duct being thoroughly vitrified tile. For installations where electrolysis can be guarded against, or is not to be feared, paper-insulated lead cables give thoroughly satisfactory service when carefully installed. Where severe electrolysis is counted on or where the ducts are filled with water for considerable lengths of time varnished cambric or rubber leaded cables should be used to insure against interruptions of service.

There are some successful installations of rubber cables, not lead-sheathed, in operation. It is, however, questionable if this is the best practice, since the ultimate life of the leaded cables will, I believe, be sufficiently extended to warrant the extra cost of the lead jacket.

Services to customers are installed in short lengths, although amounting to a considerable proportion of the cost of an underground system, and are most convenient when insulated with a material not requiring special sealing of the ends to protect against the absorption of moisture, and it is a common practice to use rubber-insulated cables for this purpose. I believe varnished cambric to be equally well suited to the requirements.

Where sub-aqueous lines are called for various constructions are possible. With narrow, shallow streams or canals the line of conduits may be dropped with deep manholes and the ducts carried underneath the bed of the stream. This usually necessitates draining the ducts toward one manhole and providing a small pump to keep the manhole clear of water seeping in. Wide, shallow streams can have a trench dredged or dug across them and cables with band steel armor laid in the trench which will usually be rapidly filled with silt. For deeper streams or wider streams armored submarine cable is required. A method used with success in some cases is to lay a cast-iron water main with specially bolted ball and socket joints along the bottom of the river and to draw an unarmored leaded cable through it. Tunnels can, of course, be used, but except for a very heavy line containing a number of cables this construction is extremely expensive, and it is cheaper to install one or more spare cables which can be switched into service in case of accident to one of the operating cables. It is perhaps well to mention here that where a submarine cable or underground cable is inserted in a pole line of any length adequate lightning protection should exist at each end of the cable.

There are many cross streets where only a distributing main of, say, three 0000 conductors is required. A single duct with small manholes every 75 feet for service distribution will cost at least 50 cents per duct foot, including service manholes and omitting all paving charges. Single .0000 cables suitable for this use can be armored for approximately 8 cents per foot, or 24 cents for three cables, showing a direct saving of 16 cents per foot of three-wire main, allowing 10 cents for trenching. If smaller sizes of conductor were used in the comparison the saving of the armored cable over the duct would be largely increased, since the duct charge is fixed, while the cost of armoring is approximately proportional to the size of the cable. With such constructions services can be installed at any point, the joint being protected by cast-iron T boxes. Such cables are usually installed inside of the curb lines, saving the expense of disturbing expensive pavement. Cables thus installed can run into manholes belonging to the conduit system at either end of the block and be then worked in with the regular distributing system. For service to buildings set back from the street, for an underground system connecting a group of buildings of a permanent character such as a college with fine grounds, where overhead lines are an eyesore, and for complete systems in small cities where the conduit system is too expensive, this type of cable represents a neglected opportunity, I believe, to American engineers.

PROPER REQUIREMENTS AS TO TEST PRESSURES.

Before it is shipped from the maker's factory every cable should be tested with an EMF. higher than the maximum working pressure. If possible, a similar test should be made after the cable is installed and jointed. As to the relation which these test pressures should bear to the working pressure, the duration of the tests, etc., there exists considerable diversity of opinion. For a good many years the writer has advocated two and one-half times the working pressure for 30 minutes to an hour as a factory test and twice the working pressure for the same length of time after the cable is installed. Cables tested under these requirements have given no indication in practice that the margin of safety was not ample. Some engineers, desiring a higher factor of safety on important and large installations, specify a factory test of three times the working pressure and a test installed of two and one-half times. Any requirement more severe than this represents a questionable investment on the part of the purchaser. It is especially undesirable to make very high potential tests for very short periods of time, since the cable may be decidedly weakened by such treatment, although it does withstand the high-potential test for the brief period specified. In short, the words "breakdown test" should not appear in cable specifications, in the writer's opinion. Boilers are tested to see if they are safe for a given working pressure, but such test is not usually referred to as a bursting test. Cable tests should be considered on the same basis. They are not to show the ultimate strength of the cable but to show that the cable is safe and satisfactory cable for the purpose for which it is intended.

EDITED BY H. C. ABELL.

Balancing a Circuit by Grounding the Neutral.

We have on our direct-current, 220 to 440-volt three-wire system, a 75 hp. 220-volt motor, which runs from midnight to 6 o'clock A. M. This greatly unbalances the load, and as the motor is a mile and a half from the station the drop in the neutral was at first considerable. By means of switches at each end, the neutral is now grounded while the motor is running, the other wire being of sufficient cross-section to carry the current. This has completely overcome the difficulty and no more trouble has been experienced.

H. S. RUSSELL, Denver, Col.

Protecting Apparatus from Water in Case of Fire.

The installation of sub-stations in the basements of commercial buildings that are not classed as fireproof buildings makes it imperative that some protection be given the apparatus installed against flooding by water in case of fire.

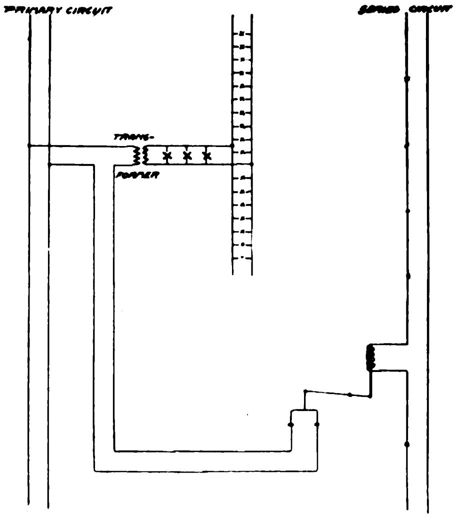
In a sub-station recently installed under such conditions a 12-inch pipe was installed in the floor and connected with the service. It is supplied with a valve for normally keeping the pipe closed, but which is be opened by the operator in case of fire, and as the apparatus is on foundations raised above the floor level, with a water-tight floor overhead, little if any flooding will be possible that this pipe will not care for.

EDISON ELECTRIC ILLUMINATING CO.,
Boston, Mass.

An Automatic Switch for Controlling Constant-Potential Lights from a Constant-Current or Street-Lighting Circuit.

This consists of a pair of arc-lamp magnets with suitable contacts mounted on a wooden frame and placed in an old 1,000-watt transformer case.

The illustration shows switch used to control eighteen 25 cp. incandescent street lamps from a 7.5-ampere series arc circuit. The nearest series incandescent circuit was 3½ miles away and it would not pay to extend the line for 18 lamps.



DIAGRAM

They were at first turned on and off by hand, but after being out all night and burning all day a few times this method was found unsatisfactory, and the automatic switch was designed to start and stop the lights when the arc lamps were put on or taken off.

J. T. COWLING,
Mt. Vernon, N. Y.

Method of Installing Bell and Push Button on Old System.

Several months ago I was called to our leading hotel to install a bell and push button between two rooms. The party was confined to his bed and wished to call his nurse from the other room.

The hotel was wired on the return call system; we had no bells or batteries in stock, and the job was urgent. After looking over the layout I opened the bell connection on one side, connected lamp cord in series with bell, inserted push button in other end of lamp cord, which I made long enough to reach to patient's bedside. I then had bell and push in series. To get the battery I short-circuited push button at office annunciator three floors below. It worked all right.

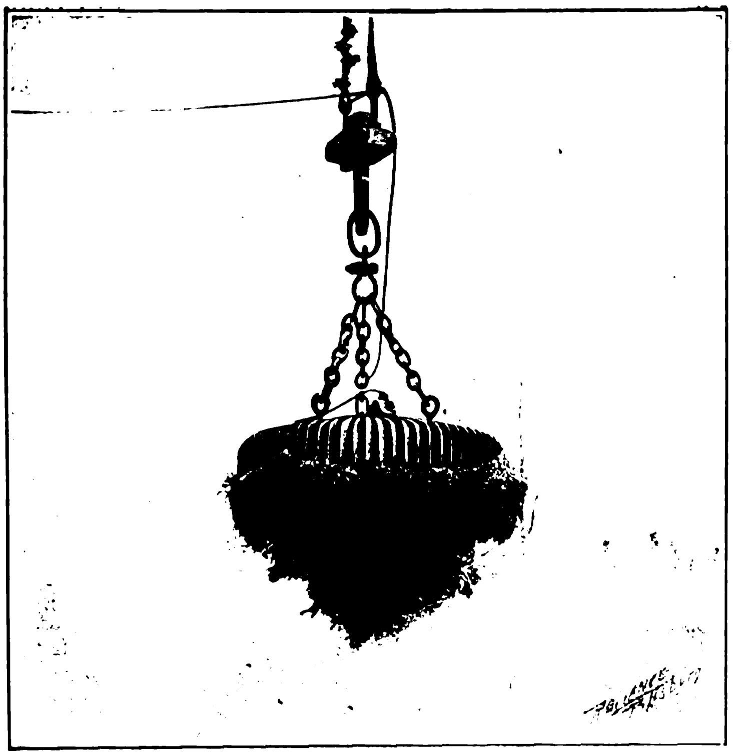
*Paper presented before the National Electric Light Association at its 28th convention, held at Denver-Colorado Springs, Col., June 6-11 1905.

LIFTING MAGNETS.

The idea of utilizing magnetic force for lifting purposes is not new, but it is only comparatively recently that the apparatus and mechanism has been perfected.

The Electric Controller & Supply Company of Cleveland has devoted much time to testing and perfecting various forms and types of magnets for handling iron and steel, such as light and heavy melting scrap, steel ingots, blooms, billets, etc., which has resulted in electric magnets being extensively adopted by various concerns engaged in the iron and steel industry.



Magnet Handling Machine Borings.

It may not be generally known that a single design of magnet is not adapted to handling the full range of material above mentioned; on the contrary the magnet must be designed to suit the class of metal to be lifted. A magnet, for instance, which would handle five tons in the form of an ingot, might not lift over 600 pounds in the form of thin plates. In other words, the magnet has to be designed with a general view to the work it is expected to perform.

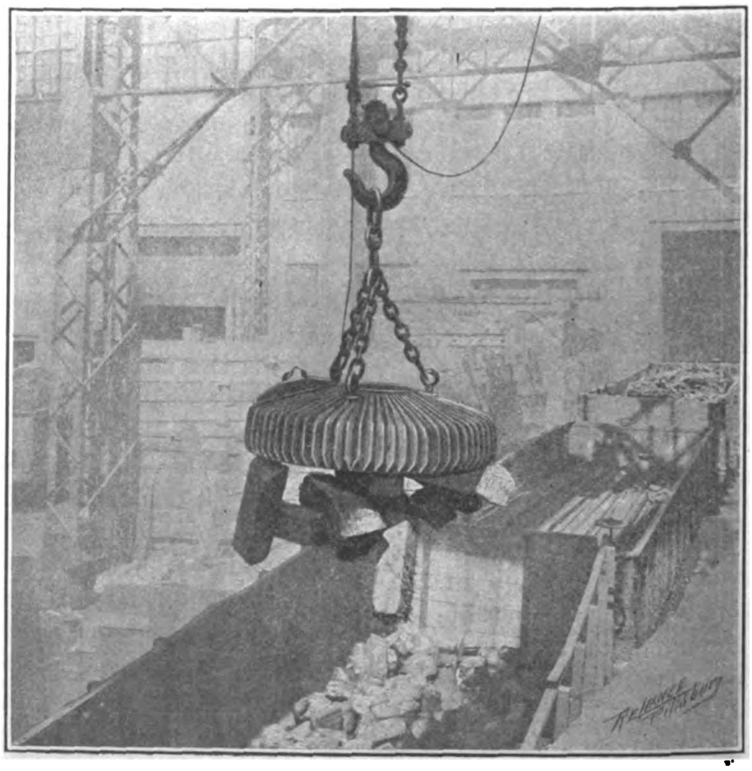
Magnet Handling Rail Ends.

Experience has proven that the advantages of the electric magnet over other forms of lifting machinery are saving in time, saving in labor and a saving in storage space. That they do their work well may be inferred from the fact that in practical trials electric magnets have lifted as much as 11,000 pounds and could undoubtedly be designed to lift even heavier loads. As an illustration, however, of the capacity of an ordinary electric magnet in every-day work, assuming the average lift to be 1,000 pounds, and that the work is to consist of loading from cars into furnace charging boxes; also that the crane man can make a transfer in 45 seconds, or 90 per hour, and that the crane works 11 hours in each 12-hour turn, a crane using such a magnet will have a loading capacity of 1,000 × 90 × 11 ÷ 2,000 = 494 tons per turn.

One five-ton crane is generally provided for every three fifty-ton furnaces in an open-hearth plant, and three such furnaces would require about 225 tons of stock per 12-hour turn.

It is evident, therefore, that with such a magnet a five-ton crane could serve four such furnaces with ample margin of safety, thus increasing the capacity of the crane besides saving the wages of the labor ordinarily used for filling the boxes.

There are two general methods of wiring electric magnets used for lifting. Of course, a controller must be mounted in the crane cab. A drum is then mounted on the trolley and geared to a hoist shaft. A twin conductor flexible cable conveys the current to and from the magnet, the drum taking care of the slack. The cable is connected to a pair of contact rings on the drum and the current is conveyed from the controller in the cab to the drum through an extra trolley wire and returned through the common return trolley wire. In the second method the twin conductor cable goes up through a pulley block attached



Magnet at Work Handling Heavy Crop Ends.

to the crane trolley; back to a block attached to the girder near the cab; down through an idle block, and back through the second block to the switch or controller in the cab. A weight is attached to the idle block which rises and falls to take care of the slack cable required.

Fast Electric Traction.

(From the London Post.)

At present public interest in Germany is concentrated on the possibility of high-speed electric traction between Berlin and Hamburg, which, if a new straight line were built, would be 155 miles distant by rail. During the discussion of the high-speed experimental line , Messrs. Siemens & Halske proposed a single-track electric line at a cost of $17,500,000, on which trains would run the whole distance either way, with a stop half way, in five minutes under two hours. The General Electric Company proposes a double line, on which trains would travel 100 miles an hour and do the journey in 1 hour 25 minutes, for $32,500,000. For $37,500,000 they believe they could raise the speed to 125 miles an hour.

The Steam Turbine Controversy.

The Edison Electric Illuminating Company, of Boston, has been running two 5,000 kw. Curtis turbines for a year, and their operation has been so successful that the company has ordered the third installation of a 5,000 kw. Curtis turbine.

A leading official of the Edison Company says: "There seems to be considerable discussion in the press as to the merits of the Parsons and Curtis turbines, the former controlled by the Westinghouse Company and the latter by the General Electric Company. Both are good machines, but the General Electric Company has already sold three Curtis turbines to one Parsons in this country and the Curtis machine is by far the younger machine. I understand that the General Electric Company has sold 300 Curtis turbines and has delivered 190."

Canadian Electrical Association Convention.

Nearly 300 members were in attendance at the 15th annual convention of the Canadian Electrical Association, held last week at Montreal. The programme, as published in last week's ELECTRICITY, was carried out in every detail. The following papers were read:

"Effects of Frequency and Voltage on Transformers," by Mr. M. A. Sammett; "Transformers," by Mr. R. T. McKeen; "Selection and Maintenance of Service Meters," by Mr. William Bradshaw; "Incandescent Lamps," by Mr. A. B. Lambe; "The Operation of Alternators in Parallel," by Mr. A. L. Mudge; "Induction Motors," by Mr. H. A. Burson; "Heating of Inclosed Inductors," by Prof. R. B. Owens;. Economy of Isolated Plants," by Mr. K. L. Atkin; "Notes on Steam Engines and Boilers," by Mr. William McKay.

New York Electrical Society's Annual Meeting.

At the 24th annual meeting of the New York Electrical Society it was announced that the finances and membership list of the society were in a sound condition, and Secretary Guy's report showed that 46 members had been elected during the season; the loss by death had been 4, by resignation, 25; ten had been dropped and the total existing membership was 636. The report of the treasurer showed a steady improvement in the finances of the society. The officers elected were:

President—W. S. Barstow.

Vice-presidents—H. G. Stott, Putnam A. Bates, Max Loewenthal.

The vice-presidents elected in 1904 for two years are Albert F. Ganz, Louis B. Marks, W. S. Rugg.

Secretary—George H. Guy.

Treasurer—H. A. Sinclair.

Electric Process of Smelting Ores.

The Dominion Government has appropriated $15,000 for the purpose of making experiments with tho electric process of smelting ores and manufacturing steels. The experiments will take place at the plant of the Consolidated Lake Superior Company at Ottawa, which concern will supply 400 hp. for four months without charge.

Soldering Paste.

As every one in the trade is aware there are numerous makes of solder or soldering paste on the market. Soldering paste plays a very important part in many lines of industry and frequently very much depends on its holding or binding qualities. In view of this fact it is only natural that the best soldering paste should be sought for especially in the electrical industry, where so much depends in the way of electrical resistance on a joint.

From tests that have been made, as well as from practical experience, the soldering paste manufactured by the Chicago Solder Company, 46 North Union street, Chicago, would seem to meet every requirement. Persons interested may obtain full information on the subject by addressing the above concern.

ELECTRICAL PATENT RECORD.

LETTERS PATENT ISSUED JUNE 20, 1905.

Electric Railways and Appliances.

792,689. Circuit-Closer for Trolley-Signals. Harold E. Bradley, Warwick, R. I. Filed Oct. 19, 1904.

792,818. Railway Signaling System. Ezra R. Fern, Scranton, Pa., assignor of one-third to John W. Barnes, same place. Filed Sept. 6, 1904.

792,903. Trolley-Stand. Frank N. Kelsey, New Haven, Conn., assignor of one-half to Cornelius Conway, Jr., same place. Filed April 14, 1905.

792,919-920. Car-Fender. John O'Leary, Cohoes, N. Y. Filed Nov. 7, 1904, and Feb. 28, 1905.

792,959. Clamp for Trolley-Wires. Chris C. Bakewell, Kaylor, Pa., assignor of one-half to T. W. Minford, same place. Filed March 31, 1905.

792,963. Railroad-Signal. Albert M. Bullard, Somerville, Mass., assignor to the American Signal Company. Filed May 8, 1903.

Electric Lights and Appliances.

792,738. Electric Cigar or Lamp Lighter. Frank W. Smith and William H. Smith, New York City. Filed Aug. 1, 1902, Renewed Jan. 9, 1905.

792,756, Illuminated Sign. Hjalmar Christensen, Seattle, Wash., assignor of one-half to Aral Gustavus Walin, same place. Filed Nov. 28, 1904.

Electrical Machinery and Apparatus.

792,684. Electric Motor. Thomas S. Watson, Milwaukee, Wis. Filed March 21, 1905.

792,734. Automatic Electric Switch. Herman A. Schultz, Berkeley, Cal. Filed Jan. 3, 1905.

792,748-749. Power-Transmitting Mechanism. Bion J. Arnold, Chicago, Ill. Filed Jan. 31 and Feb. 19, 1900.

792,762. Dynamo-Electric Machine. Gano S. Dunn, East Orange, N. J., assignor to the Crocker-Wheeler Company, Ampere, N. J. Filed Oct. 24, 1904.

792,787. Electric Unloader for Air-Compressors. William Prellwitz, Easton, Pa., assignor to the Ingersoll-Sergeant Drill Company, New York City. Filed Nov. 20, 1903.

792,845. Electrical Switch. Hubert Pfirmann, Frankfort-on-the-Main, Germany. Filed Aug. 20 1902.

792,859-860. Electromagnetic-Switch. August Sundh and David L. Lindquist, Yonkers, N. Y. Filed Oct. 27, 1904.

792,875. Block-Signaling Mechanism. Charles P. Bass, Portland, Ore. Filed March 7, 1904.

792,974. Countershaft Attachment for Electric Motors. Edwin R. Douglas, East Orange, N. J., assignor to the Crocker-Wheeler Company Ampere, N. J. Filed Oct. 17, 1904.

793,035. Electric Meter. Isidor Kitsee, Philadelphia, Pa. Filed Nov. 17, 1902.

Telephones and Telephone Apparatus

792,601. Sanitary Attachment for Speaking-Tubes or Telephone-Mouthpieces. Walter S. Little, Lynn, Mass. Filed March 3, 1905.

792,691-693. Telephony. Edward A. Buell, Dekalb, Ill., assignor to the Selective Signal & Telephone Manufacturing Company, Sycamore, Ill. Filed May 9 and Oct. 25, 1904.

792,927. Telephone-Transmitter. De Elbert A. Reynolds, New York City. Filed Feb. 25, 1905.

Miscellaneous.

792,597. Electrolytic Cell. John F. Kelly, Pittsfield, Mass., assignor to the Southwestern Exploration Company, Alamagordo, N. Mex, Filed Sept. 9, 1904.

792,611-613. Battery Grid. Henry C. Porter, Waukegan, Ill., assignor to the Evansville Battery & Electric Company, Evansville, Ind. Filed Aug. 19, 1904.

792,612. Battery-Plate Separator. Henry C. Porter, Waukegan, Ill., assignor to the Evansville Battery & Electric Company, Evansville, Ind. Filed Aug. 19, 1904.

792,639. Vapor Electric Apparatus. Willis R. Whitney, Boston, Mass., assignor to the General Electric Company, Filed Dec. 19, 1903.

792,776. Magnetic Separator. Elwin C. Kavanaugh, Holyoke, Mass. Filed April 15, 1904.

792,855. Electric System. Axel L. Sjoberg, Union Hill, N. J. Filed Sept. 23, 1904.

792,892. System and Means for Laying Electrical Wires in Conduits. Guy M. Gest, Cincinnati, O. Filed Feb. 14, 1903.

793,033. Electric Circuit. Isidor Kitsee, Philadelphia, Pa. Filed Aug. 16, 1901. Renewed Oct. 16, 1903.

793,036. Electric Clock. Isidor Kitsee, Philadelphia Pa. Filed Nov. 17, 1902.

793,037. Electric Telegraphy. Isidor Kitsee, Philadelphia, Pa. Filed Feb. 4, 1905.

793,039. Process of Treating the Metal Mixtures Produced as a By-Product in Electrolytic Metal-Refining. Anson G. Betts, Troy, N. Y. Filed May 20 1904.

THE TELEPHONE WORLD.

Proceedings of the Interstate Independent Telephone Convention at Chicago—Tragic Death of Mr. S. P. Sheerin While Responding to the Address of Welcome.

The annual convention of the Interstate Independent Telephone Association at Chicago last week was well attended, but the first day's session was cut short by the sudden death of Mr. S. P. Sheerin.

The convention had met in the hall on the sixth floor of the Auditorium at 10 o'clock for the first business session. Mayor Dunne was scheduled to give the welcoming address, but, unable to be present, he was represented by Public Prosecutor Howard S. Taylor.

Mr. Sheerin was selected by the executive committee as the man to answer the welcome of Mayor Dunne as given by Mr. Taylor.

The address of Mr. Sheerin, which he had only partly completed when he was stricken, is as follows:

"On behalf of the delegates present and the 2,500,000 telephone users in the United States whom we have the honor to represent, I thank you most sincerely for this cordial welcome to Chicago. I may now be in answering Mayor Dunne's welcome, addressing one of Chicago's future mayors. At least I hope so."

At this point the speaker's face blanched and turning to President Powers he said:

"Colonel, I feel one of my—"

Mr. Powers arose to assist him. As he tottered for a moment and closed his eyes, the chairman, who had one arm in a sling, reached out to hold him, but he slipped to the floor with a crash. Several of the convention members sprang to their feet and hurried to Mr. Sheerin, but it was apparent that he had died almost as he fell.

Messengers were sent for a doctor, but both of the Auditorium house physicians were out, and the hotel management spent some time trying to find them. It was half an hour before friends of Mr. Sheerin succeeded in bringing Dr. Alfred A. Watson and Dr. J. Mitchell Taylor to the hall. Their efforts at causing artificial respiration were useless.

The convention adjourned immediately after adopting a resolution of respect and appointing an honorary escort to accompany the body to Indianapolis.

During the first day's session it became known as a result of a committee meeting that a contest had developed between various insurance companies throughout the United States and the Independent telephone associations.

For years, the Independent telephone men declare, insurance companies have been charging what the telephone men deem to be excessive rates for insuring telephone switchboards and appliances. An attempt is to be made, it is said, to form a co-operative telephone insurance company.

The only business transacted during the first day's session was the ratification of the movement of several months ago, combining the National Association and the National Interstate Association. It was decided that passage of the resolutions on the death of Mr. Sheerin, and election of officers should be the only business done. All social features of the convention were abandoned.

On Wednesday morning the committee on nominations reported, and on its recommendation the following were elected:

OFFICERS ELECTED,

President—James B. Hoge, Chicago.

First vice-president—Theodore Gary, Macon, Mo.

Second vice-president—John Van Lieu, Los Angeles.

Secretary—A. L. Leu, Nashville.

Treasurer, James B. Splane, Pittsburg.

Mr. A. B. Green Shields presented a paper on "The Value of Telephone Securities," which analyzed the finances of various classes of public service corporations and showed that Independent telephone securities presented decided advantages to the investor.

The committee on standardization of equipment recommended the establishment of a National Bureau to take cognizance of the details of such standardization.

There was a roll-call of States in the afternoon, and the delegate from each State was asked to present information showing the condition of Independent telephony in his State. California reported 20,000 Independent telephones in Los Angeles. Iowa proved to be the banner State, there being 220,000 telephones and a State organization in existence since 1896. Emphasis was placed on the strength which rural lines gave to the Independent movement, this development being the secret of Iowa's success.

Invitations for the next convention were received from Atlantic City, Nashville, Detroit and Put-in-Bay, and were referred to the executive committee.

Mr. W. L. Lunbach read a paper on "Standard Toll Signs," in which he urged the adoption of a uniform sign or trademark for all Independent telephone companies.

A paper by Mr. S. G. McMeen on "Combined Telephony and Telegraphy," was then read by title. An address on the programme by President Hoge, on "The National Interstate Telephone Association," was also read by title, owing to lack of time. The committee on advertising again reported in favor of the red, white and blue sign, and after considerable further discussion its report was adopted. The convention then adjourned its session. Thursday was given up entirely to inspection of exhibits by the members in attendance.

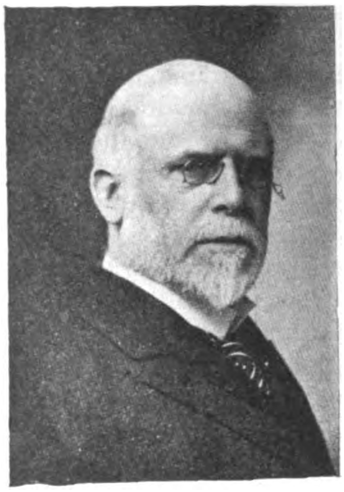
SIMON P. SHEERIN.

It is safe to assert that Mr. Sheerin was the most popular man in the Independent telephone movement and the most prominent Independent telephone magnate in the country.

Mr. Sheerin was born in Dublin, Ireland, February 14, 1846. His father, an Irish revolutionist, left Ireland for the United States in 1849, landing at New Orleans. Later the family located at Dayton, O. In 1875 Mr. Sheerin became the editor of the "Logansport Pharos," one of the important Democratic papers of Indiana.

In 1888, at the Democratic National Convention in St. Louis, Mr. Sheerin was elected a member of the National Convention, and in the same year in Washington was elected secretary of the National Committee. He was re-elected secretary of the National Democratic Convention in 1898. In recent years he had been identified with large enterprises, such as natural gas and telephones, and was president of the New Long Distance Telephone Company of Indianapolis

He is survived by a widow and eight children. Mr. Sheerin had not been in good health for some time, and, although he is said to have suffered an attack similar to this one four years ago, he attributed his indisposition to overwork.



SIMON P. SHEERIN.

New York State Independent Telephone Convention.

At a recent annual meeting of the New York Independent Telephone Association, held in the Common Council Chambers at Albany, about 78 delegates were present, representing the properties of Independent Telephone Companies throughout the State having an investment of more than $15,000,000. After the appointment of the various committees by President Howard Hendrickson, Secretary T. S. Lane made his report.

A resolution was adopted setting forth that inasmuch as several of the State departments are not equipped with Independent telephones it is deemed advisable that an effort be made at once to have such installed. The claim is made that if the rates of the Bell telephone were reduced to the rates of the Independent companies, that both systems might be installed at the cost of one. The matter was referred to the executive committee with full power to act.

The following officers were elected; President, Howard Hendrickson, Albany; first vice-president, Boyd McDowell, Elmira; second vice-president, W. R. Campbell, Niagara Falls; treasurer, T. Harvey Ferris, Utica; secretary, T. S. Lane, Buffalo.

The Morrow County, O., Telephone Company has increased its capital stock from $30,000 to $150,000. Amzi A. Whiting is the president and Mark Cook, the secretary.

The Pataskala & Hebron Telephone Company, Pataskala, O., has increased its capital from $65,000 to $100,000. Frank L. Beam, president, and D. E. Sopp, secretary.

GENERAL ELECTRICAL NEWS.

LIGHTING.

Adairsville, Ga —An election for water and electric light bonds will soon be held here.

Baltimore, Md.—At the annual meeting of the stockholders of the Mount Washington Electric Light & Power Company, held lately at the company's offices, Mount Washington, the following officials were elected for the ensuing year: President and general manager, Thomas W. Offutt; vice-president, Allen S. Miller; secretary and treasurer, Harry J. McIntyre. The company is expending about $100,000 for the building and new machinery, and will have the new plant, which is expected to be one of the best in the country, in operation by September 1.

Chilton, Wis.—The Chilton electric light plant, owned by Nicholas Bink, of this city, has been sold to the American Electric Light, Heat & Cold Storage Company for $20,000.

Covington, Ga.—This city will rebuild the electric light plant during the next 50 days.

Ensley, Ala.—At a recent meeting of the mayor and board of aldermen the initial step was taken looking to the erection of an electric light plant by this city. The practicability of building a plant was referred to the light committee with instructions to get up all the data on the subject, plans and specifications and report back to the council at its regular meeting on July 6 The vote on the question was unanimous.

Fayetteville, Tenn.—The Fayetteville Electric Light Company has contracted for a power house and a stone dam across Elk River about 1½ miles from here above Bonner's Island. The cost is estimated to be about $250,000.

Grayson, Ky.—Claude Wilson, of Olive Hill, has secured franchises here for waterworks, electric light plant and telephone system.

Jacksonville, Fla.—A franchise has been granted to T. R. Osmond for the construction of an electric light plant.

Lehi, Utah.—The Utah Sugar Company will install an electric light plant here.

Melrose, Minn.—This city will have a new electric lighting plant.

Prosser, Wash.—At a recent city council meeting the Prosser Falls Land & Power Company applied for a new electric light franchise. The ordinance will come up for final passage on the first Tuesday in July.

Rock Run, Pa.—There is a movement on foot among the citizens of this place to have electric lights installed here, particularly along the road leading to the village: The officials of Valley Township are going to try to break up the highwaymen's pranks along the Rock Run road, and they see no better way than to have lights along the thoroughfare in question.

San Angelo, Tex.—Plans are being made at Miles for the organization of an electric light company to furnish light and power for the town. The citizens are very desirous of securing this plant, and the installation is a certainty.

Spirit Lake, Ia.—This city is preparing to make a $6,000 improvement on its electric light plant.

Sunny Side, Wash.—This town and Mabton are figuring on putting in electric lights and waterworks and the company will probably make a proposition to not only light both towns, but also to furnish them electric power for manufacturing purposes transmitting the current from the large plant at Prosser that is just being completed.

Thomasville, Ga.—This city has received a donation of $3,000 for the purpose of erecting an electric light plant to light the streets, parks and public buildings of this city. The contribution is from a number of citizens known as the light committee, consisting of F. D. Dismuke, R. H. Neel, N. C. Ball, F. H. Smith and W. H. Brandon.

STREET RAILWAYS.

Albany, N. Y.—The State Board of Railroad Commissioners last week granted the application of the Buffalo, Batavia & Rochester Electric Railway Company to construct the proposed road from Williamsville, through Batavia to Rochester. It is an extension of the Batavia & Williamsville Railway. The company, has a capital of $3,500,000 and the road will be 65 miles long.

Alexandria, La.—T. H. Bush, of Mobile, is at the head of the project to construct an electric street car line in this city.

Alton, Mo.—Officials of the Alton, Jacksonville & Peoria Railway Company recently announced that they expect to begin constructing their electric line in this city.

Bellefonte, Pa.—The State College engineering corps has completed the survey for a trolley road from here to State College, with loops to Milesburg and to Coleville and perhaps other points. Active steps will soon be taken toward the construction of the line.

Bluffton, Ind.—The Fort Wayne, Bluffton & Marion Interurban Company has at last secured a right of way into this city. This was done without the aid or consent of the city council, and as the right of way is all over private grounds, no objection can be raised.

Cleveland, O.—Plans for the entire reorganization of the Eastern Ohio Traction Company were lately prepared by George D. Bishop, H. P. McIntosh, W. D. Rees, H. A. Everett and W. H. Lamprecht after several months of careful investigation and study of the situation. The plans call for the formation of a new company to be known as the Cleveland & Mahoning Valley Traction Company with a capital stock of $3,000,000. The road is to be extended from Garrettsville to Leavitsburg, where it will connect with the Pennsylvania & Mahoning Valley Traction Company to Warren, Youngstown and Newcastle, giving the line an important connection for through travel and some good territory for its own business.

Donalds, S. C.—The question of building an electric line between here and Due West, is again being discussed, and it really looks as if something would be done this time. The promoters of the road are planning to get the electric power from Ware's Shoals.

Magnolia, Miss.—The city council has considered the application of the Magnolia & Summit Electric Railway Company for a franchise. It is understood that the work on the line will be commenced in a short time. The company has been chartered something more than a year, and the promoters have been engaged in securing rights of way and making other preliminary arrangements.

Mansfield, O.—The Cleveland, Ashland & Mansfield Traction Company, of this city, with $1,000 capital, was incorporated by W. H. Abbott, A. J. Halle, C. W. Collister, Frank Butter and H. B. Cavanaugh. The company proposes a traction line between here and Ashland, and a company having the same name consented to the use of it by the new one.

Newark, N. J.—President McCarter, of the Public Service Corporation, has announced that a high-speed electric road is to be built from Park place, Newark, to New York by a subsidiary company. Mr. McCarter said that the scheme has already been financed and that work on the new road will be pushed as rapidly as possible. It is proposed to run at a high rate of speed, so that passengers from Newark can reach the center of New York in less than 30 minutes.

New York City.—For the purpose of introducing the three-phase alternating current electric traction system on steam railroads, the Railway Electric Power Company has been organized with a capitalization of $1,500,000, Among the directors are John Borne, president of the Colonial Trust Company; William L. Bull, of Edward Sweet & Co.; Henry Seligman, Stephen Peabody, H. R. Du Val and Gustave Leve.

Oskaloosa, Ia.—Local business men lately subscribed $130,000 in stock, and the interurban trolley line from here to Buxton is assured.

Riverton, N. J.—The Camden & Trenton Railway Company is trying to get the right of way to run a line through this place and direct to Philadelphia by way of Palmyra and West Palmyra, and thus avoid the necessity of using the Camden & Suburban Road to reach the Camden ferry.

Schenectady, N. Y.—A project is on foot to build and equip a trolley line between this city and Middleburg.

BIDS WANTED.

Brooklyn, N. Y.—Sealed bids or estimates will be received by John T. Oakley, Commissioner of Water Supply, Gas and Electricity, until 2 o'clock P.M., on Wednesday, July 19, for this city, for furnishing constructing and installing three electrically-driven, pumps with all appliances complete, for high-pressure fire service, in a pumping station to be erected on the northwest corner of Willoughby and St. Edward's streets. The time allowed for doing and completing the work will be 220 working days. The security required will be $25,000. Also for furnishing, constructing and installing three electrically-driven pumps, with all appliances complete for high pressure fire service, in a pumping station to be erected on the northeast corner of Furman and Joralemon streets. The time allowed for doing and completing the work will be 220 working days The security required will be $45,000. Bidders shall submit plans with their bids showing the general style of motors and pumps proposed and of the foundations to be provided. No bid will be received unless accompanied by the above plans.

NOTES FOR INVESTORS.

Latest quotations for copper are: Electrolytic, 15@15⅛c.; Lake 15⅛@15¼c.; casting, 14¾@14⅞c.

The Electric Storage Battery Company has declared the regular quarterly dividends of 1¼ per cent. on its common and preferred stocks.

The syndicate which bought the $4,000,000 bonds of the Keystone Telephone Company of Philadelphia is headed by Fisk & Robinson of New York.

The Trolley Electric Vehicle Company of America, of Wilmington, Del., has been chartered to carry persons, freight and express; capital, $1,000,000.

The United Gas & Electric Company of New Jersey has declared the regular semi-annual dividend of 2½ per cent. on its preferred stock, payable July 15 to holders of record June 30.

New York and Brooklyn traction stocks were lively during the past week. They are about the easiest stocks to move on account of being controlled by cliques of financiers and politicians.

The Westinghouse Electric & Manufacturing Company has declared the regular quarterly dividends of 2½ per cent. each on its preferred, assenting and non-assenting stocks, payable July 10.

William F. Harrity of Philadelphia, acting for the reorganization committee, bought the franchise and properties of the Lehigh Valley (Pa.) Traction Company at the recent foreclosure sale for $2,000,000.

The entire outstanding issue of bonds of the Cumberland (Tenn.) Light & Power Company, a subsidiary concern of the Nashville Railway & Light Company, has been called for payment on July 1. The issue amounts to $387,000.

The Detroit United Railway Company has declared a dividend of 1¼ per cent. This is an increase of ¼ of 1 per cent. over the previous payment and places the stock on a 5 per cent. basis. The dividend is payable August 1. Books close July 15 and reopen August 2.

From present indications the street railway problem in Chicago is in just as much of a tangle as ever, and investors will not know where they stand in the matter of the value of their securities until the rights of the companies under the old Illinois State law have been defined by the United States Supreme Court.

The Commonwealth Electric Company of Chicago has sold to a syndicate composed of the Merchants' Loan & Trust Company, N. W. Harris & Co., and Russell, Brewster & Co., $1,000,000 of the company's first mortgage 5 per cent. bonds. The price has not been made public, but is understood to have been well above par. The last sale of Commonwealth bonds on the Chicago exchange was at 107.

It is reported in Wall Street that the Long Island Consolidated Electrical Companies, which has a number of well-known Pennsylvania Railroad officials as directors, may be made a holding company for the stocks of the Long Island traction companies, which the Pennsylvania Railroad Company, through the Long Island Railroad Company, and the Interborough Rapid Transit Company have jointly purchased. The Consolidated Electrical Companies is authorized to build and operate or to furnish power for railroads and for other purposes, and to buy and hold the stocks of electrical and railway company.

POSITIONS VACANT.

FREE ADVERTISING.

Inquiries from those seeking employment as Electrical Engineers, Superintendents, Foremen, Salesmen, Dynamo-tenders, Constructing and Designing Engineers, Electro-metallurgists, or in other positions requiring technical experience or intimate acquaintance with the electrical trade, will be inserted in this column Without Charge. Each advertiser invited to repeat his advertisement in case the first one produces no results.

It is the desire of the management of this paper to bring the unemployed and employer together to their mutual benefit, and to this end they invite the former to make use of this column without charge. No advertisement exceeding five lines (about 35 words) will be inserted, but advertisers may write fully of their qualifications and these letters will be kept on file for future reference in filling vacancies which may occur.

Applicants should write clearly and distinctly and enclose postage to secure attention.

Address all communications to Free Advertising Editor, "Electricity," New York.

Electrical Engineering,
By E. ROSENBERG.
A work intended for students and practical men. Fully illustrated. price $1.50. Sent Postpaid on receipt of price.
ELECTRICITY NEWSPAPER CO
136 Liberty St., New York.

SOMETHING NEW.

In Line with the Twentieth Century Advancements of the World's Industries.

WHEN THE COVERS TO PRACTICAL ELECTRICITY ARE THROWN BACK

The Student, the Steam Engineer, the Practical Man, the Electrical Engineer and the College Professor see therein a new light, illuminating the way to an easy and effective method of studying the art of Electricity. The publishers have on file over four hundred letters, the writers ranging in rank from beginner to noted Electrical Engineers, commenting on the merits of this new work.

BOOK CONTAINS:

287 Pages of Subject Matter.

162. Pages Dictionary and Tables

427 Questions and Answers.

95 Illustrations.

20 Tables (all that's required).

Size 6 x 4½ inches.

Flexible Binding.

Set in 8 Point Type—a good, readable size.

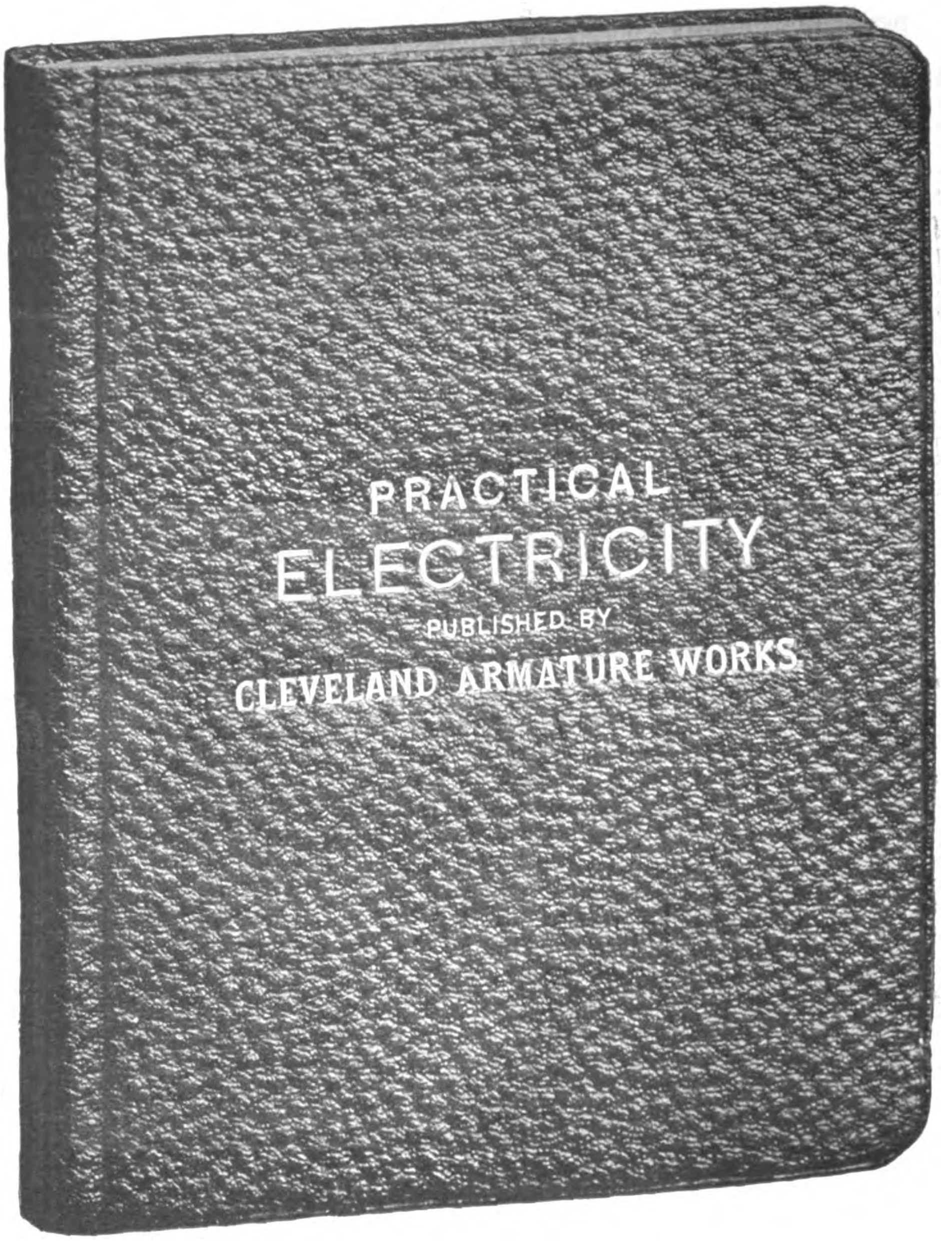

TABLE OF SUBJECTS:

Chapter.
I—Wiring.
II—Electric Batteries. Electric Plating.
III—Magnetism.
IV—The Magnetic Circuit.
V—Magnetic Traction.
VI—Magnetic Leakage.
VII—Energy in Electric Circuit.
VIII—Calculation of Size of Wire for Magnetizing Coils.
IX—Calculation of E. M. F.'s in Electric Machines.
X—Counter E. M. F.
XI—Hysteresis and Eddy Currents.
XII—Armature Reaction.
XIII—Sparking.
XIV—Winding of Dynamos and Motors.
XV—Proper Method of Connecting Dynamos and Motors—Self Excitation.
XVI—Diseases of Dynamos and Motors, their Symptoms and how to Cure Them.
XVII—Arc and Incandescent Lamps.
XVIII—Measuring Instruments.
XIX—Alternating Current.

A Dictionary of over 1500 Electrical Words, Terms and Phrases, giving a brief meaning of all which are in common use.

Extracts of a few of the hundreds of Letters on file.

Geo. E. Hanscom, Electrical Department Mare Island Navy Yard, says: "Send two more copies of Practical Electricity. Find this work invaluable. I guess my friends do also as they never let a chance to steal them escape. I am having chains made to attach them to my desk."

Herbert W. Kimble, Electrician, Haverhill, Mass., says: "I saw in Dartmouth College Library a copy of Practical Electricity. I was so much pleased with it I want a copy."

L. D. Burlingame, Pasadena, Cal., says: "In a trip to Arizona I lost my copy of Practical Electricity. I prize the book so highly that I enclose money order for another."

Wm. Hickey, Sec'y Electrical Workers' Union No. 49, Chicago, Ill., says: "This book is a little wonder. Every Question and Answer is given so plainly that any one can understand them. It is not only instructive to beginners, but to those advanced as well."

Camble Courtney, Newry, S. C., says: "I know nothing about Electricity yet your book gives a great deal of valuable information, it is written in such a common sense way."

Lewis P. Osborn, Wardner, Idaho, says: "Mr. Livingston, Chief Electrician of the light plant at Bozeman, Mont., gave me a copy of your book while I was in his employ. I lost it in a hotel fire; find money order for another copy."

James H. Kendle, Marine Engineer, Detroit, Mich., says: "I purchased your book from Burrows Bros. of your city. I think so much of the book. I have quite a library of books and have none I think more of than Practical Electricity."

Price $2.00. Delivered. Third Edition. Address

ELECTRICIANS' HANDY BOOK

By PROF. T. O'CONOR SLOANE, A.M., E.M., Ph.D.,

Author of "Arithmetic of Electricity," "Standard Electrical Dictionary," etc., etc.

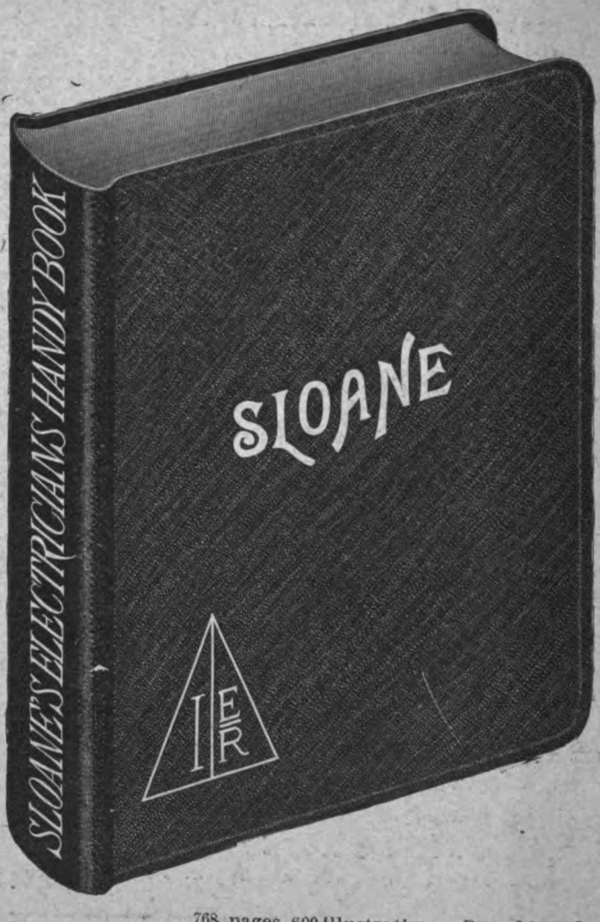
768 pages, 600 engravings. Handsomely bound in red leather, pocket-book style. Price $3.50.

A NEW BOOK FROM COVER TO COVER

A thoroughly practical book of 768 pages, covering the entire field of electricity. Contains no useless theory. Everything in it is to the point and can be readily understood by the student, the practical worker, and the every-day working electrician. The electrical engineer will also receive great benefit from its perusal and study.

It is a work of the most modern practice, written in a clear, comprehensive manner, and covers the subject thoroughly, but so simply that anyone can understand it fully. It teaches you just what you should know about electricity.

A practical work for the practical man which is without a peer. Contains 41 chapters, 600 engravings. It is the standard work on the subject. There is not a student, engineer, electrician, business manager or foreman who can afford to be without the information contained in its pages. You are doing yourself an injustice if you don't procure this book at once.



768 pages, 600 illustrations. Bound in red leather. Gilt edges. Pocket size, 4½x6¼.

CONTENTS

Chapter 1. Mathematics.
" 2. Electric Quantity and Current.
" 3. The Electric Circuit.
" 4. Ohm's Law.
" 5. Electro-Chemistry.
" 6. Primary Batteries.
" 7. Storage Batteries.
" 8. The Field of Force.
" 9. Magnets.
" 10. Induction.
" 11. Direct-Current Generators and Motors.
" 12. Direct-Current Armature Winding.
" 13. The Direct-Current Generator.
" 14. Armature Reactions.
" 15. Characteristic Curves.
" 16. The Direct-Current Motor.
" 17. Open Coil Generators.
" 18. Generators and Motor Construction.
" 19. The Alternating Current.
" 20. Alternating Current Generators.
" 21. Alternating Current Motors.
" 22. Transformers.
" 23. Management of Motors and Dynamos.
" 24. Care of Dynamos and Motors.
" 25. Station Notes.
" 26. Switchboards.
" 27. Voltmeters and Ammeters.
" 28. Distribution.

EDITORIAL NOTES.

The Steam Producer in Electric Plants.

The responsibility for the rapid development in engines and boilers rests largely upon the shoulders of our pioneers in electric lighting. The steam producer in electric plants has received a degree of attention that seems to leave little to be desired by those whose inspection of the subject is but casual.

When steady steam pressure is a necessity, combined with an economy that does not threaten the dividends of the plant, a peculiar combination is required in boiler design which partakes of the commercial as well as the engineering aspect.

To get up steam quickly is not so vital a question as to burn the coal properly. By this is not meant the mere combustion of the fuel as it is ordinarily understood, but the use of the fuel in such a manner that as much of its caloric energy as it is possible to get is absorbed by the boiler. The entire proposition is thus seen to be one in which the energy of the coal is absorbed by the boiler. If this is well accomplished a difficult problem has been solved, but not all that relates to boilers by any means. The cleaning of a boiler is of equal importance with this first requirement. A tube boiler whose incrustations are very severe runs the risk of explosion unless frequently cleaned. It is impossible to regulate and purify the water so that every sign of foreign matter is removed. The accumulations from the evaporated water form a heavy sediment which clogs up the tubes and endangers the entire plant. The steam producer is therefore not only to be considered as such but as a sediment producer as well. Alterations in the design of boilers are soon to be expected in the light of the latest applications in steam. A higher pressure and a better economy are demanded for certain purposes. This our most progressive manufacturers are attending to with every credit to their training and talent.

* * *

Activity Among Our Manufacturers.

Originally everything pertaining to electricity belonged to the category of the experimental. The old text books abound in sketches of Leyden jars, static machines, magnets and batteries. The hand magneto was a constant source of mystery, but belonged essentially to the laboratory. With the exception of lightning rods, it can hardly be said that the early days of the history of electricity represented very much in the way of manufacturing. It was not until the telegraph was well established, and electric lighting was elevated from its experimental plane to the dignity of an industry that the phrase "electrical manufacturing" deserved any special consideration. To-day, however, viewed from the standpoint of the merchant, electrical industries are matters of supreme importance. The telegraph, telephone, dynamo, motor, electric light and street railway comprise a collection of applications of electricity which have called into existence large factories. The acreage occupied by these factory sites is beginning to compete with that of the large steel corporations.

The demand for copper, iron and steel has increased so remarkably in the last few years that special agreements have been necessary between the corporations engaged in the exploitation and sale of these commodities.

Activity among our manufacturers has been rapidly increasing of late, not only because of the enormous home consumption of electrical devices and accessories, but through the influence of an incessant demand from the other side for what is now generally known as the better grade of American manufactures. This new requirement or call upon the American manufacturer has had an immensely stimulating effect upon the large plants devoted to the production of what are generally called electrical supplies. The railroads operated by electricity call for large quantities of goods of this nature. When it is considered that by far the greatest amount of electric power generated in the United States is consumed by the street railways and that this, at a rough guess, is unquestionably the heaviest quota of power utilized in the country for any purpose whatsoever, it is easy to realize that with this we find an increasing demand for new equipments as time goes on.

The statistics from which references could be made speak of the hundreds of thousands of horse power in rolling stock and plants. The element of depreciation here, where the severest practice is experienced, means a constant expenditure to make up the wear and tear of travel. The limit is not reached in this respect even under ordinary conditions, for the reason that completely new equipments must be installed before the older ones are worn out. Manufacturers are thus forced to keep up to date to meet the demand. It is the constant newness of electrical appliances that forces our factories up to the limit. This, supplanted by the gigantic nature of important electrical enterprises, means activity in an electrical sense for many months to come.

* * *

A Novel Scheme for Extending Our Export Trade.

A recent issue of the Boston "Herald" contains some excellent suggestions for the promotion of manufacturing interests within the United States as well as for advancing the country's export trade. The suggestions originated with the Massachusetts State Board of Trade in a communication to the Bureau of Manufacturers at Washington.

The document is a lengthy one and full of common sense. Among other things it says:

"Our unused water powers, either for direct power or the generation of electricity, should be utilized to the fullest possible extent. Our tariff laws should permit a much larger entry of raw materials free of duty. Reciprocity with the Dominion of Canada and Newfoundland, or any nation or dependency on this continent should be encouraged and adopted if it will give manufacturing a better opportunity and the United States a more extended market. The best and most improved machinery should be employed in all our mills and factories."

Referring to means that might be adopted for gradually improving our export trade, the communication contains the following:

"We might make one suggestion that may possibly have some flavor of novelty. For years we have had occasion to glance through the consular reports regularly, often reading them with care. While the department is to be congratulated on the considerable development of this important phase of consular work, it seems to us that there is still much room for progress in this direction. In the last 30 years there has grown up a group of publications known as 'trade papers,' which have come to be of very great importance in the industrial and commercial world. To-day each trade and manufacturing field has its organs carefully read by all progressive and ambitious. merchants and manufacturers, edited with ability by men anxious to print all the helpful information they can secure.

"If, acting through the medium of the editor of the consular reports, every member of the consular force could be made an occasional correspondent of every considerable trade paper in the land, information could be disseminated in far greater abundance, and with greater likelihood of its accomplishing the desired purpose, than by the present plan of putting it all into the covers of a single monthly periodical, even though daily bulletins help out somewhat. For instance, if the consul at Bombay or Adelaide or Rio Janeiro were directed to write once a year a letter discussing the chance for electrical apparatus in his vicinity, the electrical papers would gladly print it; the following month let him discuss textiles, the following month iron, steel, hardware, farm implements, and so on.

"This would mean the systematizing of the collection of news and suggestions from our corps of consuls, in place of what appears now to be a somewhat haphazard method of reliance, in whole or in part, on the enterprise and ingenuity of the consul himself."

The above suggestion is certainly original and novel, but if properly carried out good results should follow, and it would undoubtedly meet with the approval of every progressive trade paper editor.

◆

It is stated on reliable authority that $700,000,000 of American money is invested in Mexico in railroads, mines, ranches, street car systems and electric light and power plants.

◆

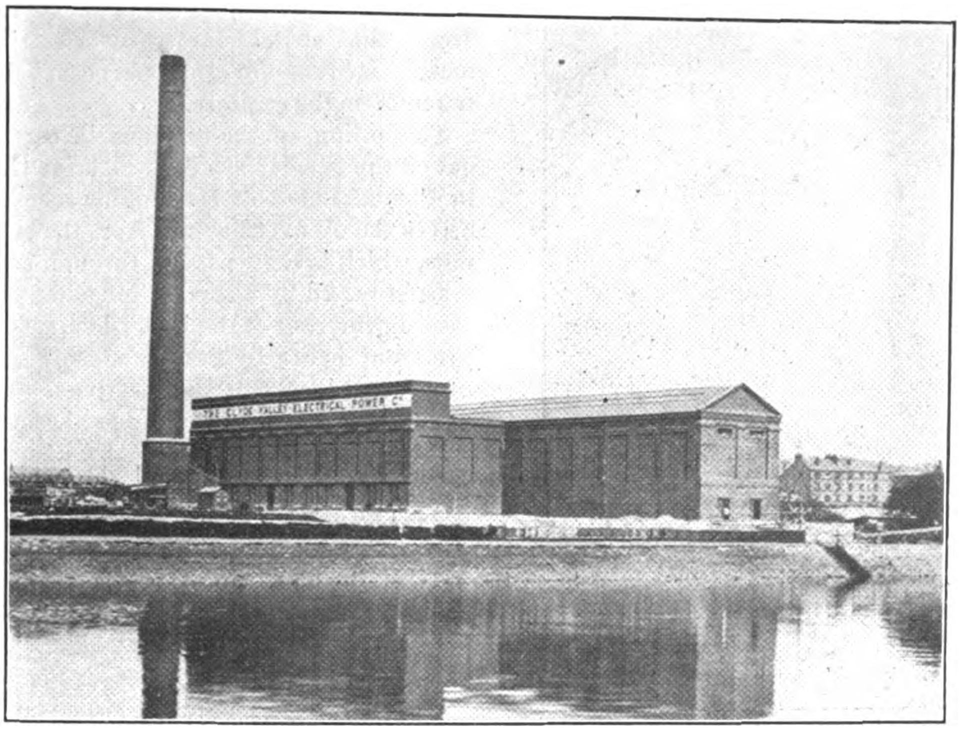
The Brooklyn Heights Railroad Company has closed a contract for two steam turbine electric generating units for extending the present power equipment of the Brooklyn Rapid Transit system. They will be the largest power machines in the world. The contracts call for a maximum guaranteed capacity of about 16,000 hp. each.

ELECTRICAL POWER SUPPLY IN THE CLYDE VALLEY.

(From our London Correspondent.)

When the various electric power supply schemes were introduced a few years ago, one was brought forward by those interested in the manufacturing industries in the district surrounding Glasgow, and this undertaking has now completed its first power station and system. The area in which the Clyde Valley Electrical Power Company, Limited, will operate, extends along the Clyde Valley from Craigdoran and Port Glasgow on the west, to Lanark and Shotts on the east, altogether some 750 square miles, containing the most important manufacturing and coal producing district in Scotland. There are two generating stations, one at Yoker and the other at Motherwell—5 and 15 miles out of Glasgow respectively; various sub-stations are dotted over the area.

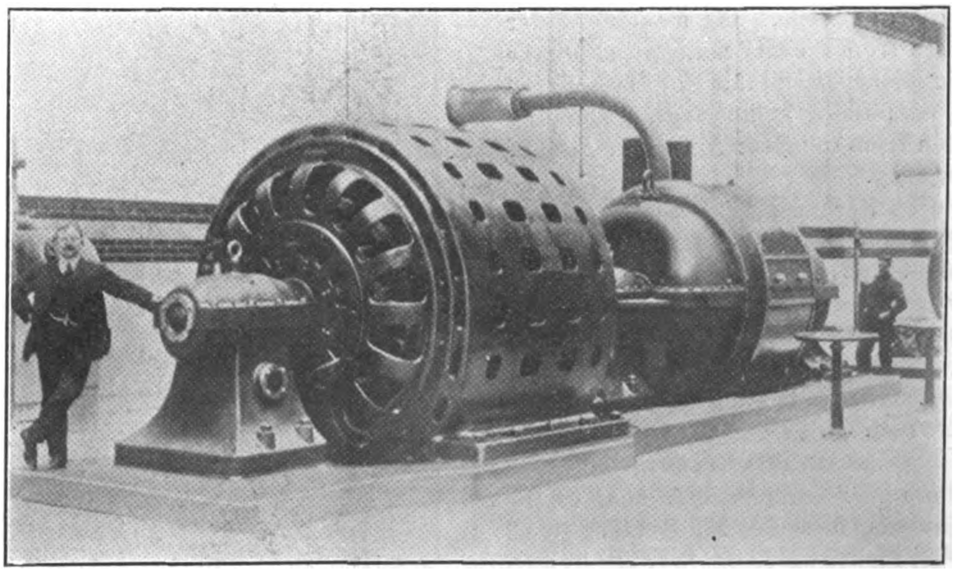


Clyde Valley Power Station at Yoker.

The Yoker generating station, of which a view is given, is situated on the banks of the Clyde, where an unfailing supply of water for condensing purposes is available. The Motherwell station being situated at a higher elevation, and above the level of the River Clyde, depends for its water supply for condensing, on electric pumps working against a head of 140 feet.

In the boiler-house there are at present four double-drum Babcock & Wilcox water tube boilers, each having a heating surface of 4,400 square feet, and fitted with superheaters capable of imparting 140 degs. F. of superheat. The boilers are connected to a main flue passing along the back, and a Green's economizer of two sections and 432 ten-foot tubes is installed. The chimney is built on the Alphons Custodis principle.

Each of the boilers is fitted with a Roney mechanical stoker, and adapted for burning efficiently a cheap class of coal. These are driven through special worm gearing by two 4½ inch by 4 inch 5 hp. Westinghouse standard engines, running at 400 r.p.m., and situated in the boiler house.



Generator End of a 2,000-kw. Turbo Set at Yoker.

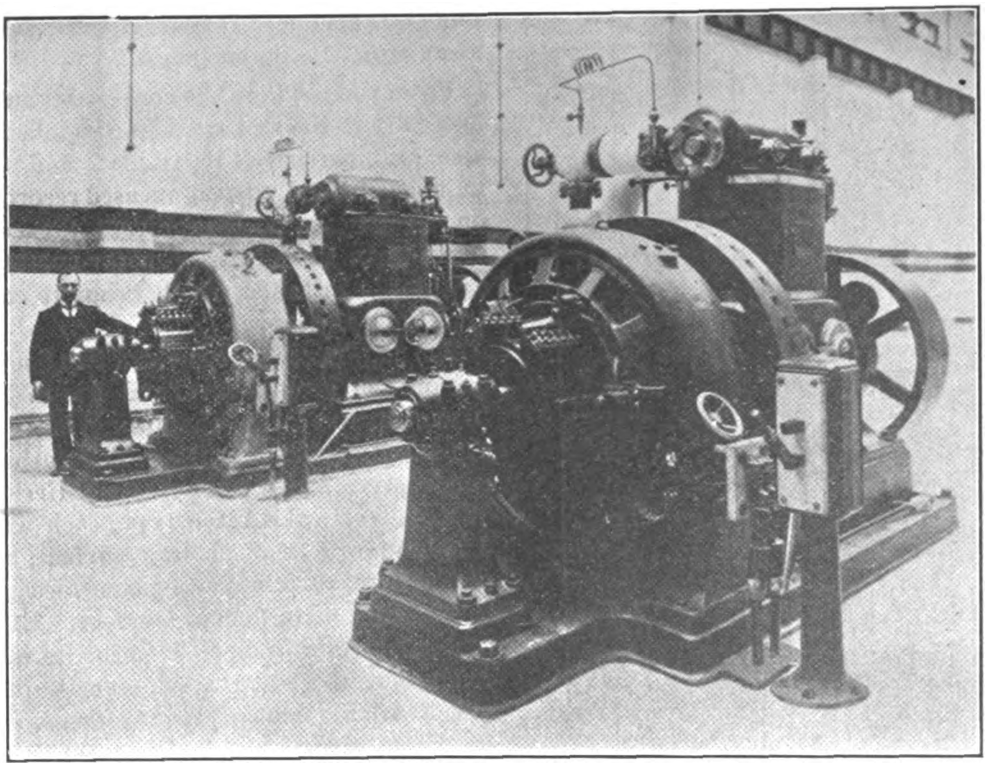
The coaling arrangements of the power station are most complete and from start to finish the fuel is untouched by hand. Coal is brought in wagons to the company's private siding where it is dumped by a hydraulic ram into the crusher pit passing through a crusher and screen operated by a 10 hp. inclosed shunt motor running at 650 r.p.m. It is there picked up by a bucket conveyor and carried to the storage bunkers over the boiler house. This conveyor, which is driven by a 15 hp. inclosed shunt wound motor, is also used for carrying the ashes away from the boiler house.

From the bunkers the coal passes automatically to the stokers, being weighed—also automatically—in transit, and the number of hundred weights used recorded on an indicator. To prevent the coal sticking in the shoots a motor-operated agitator is installed which keeps it constantly on the move.

The engine room consists of two floors, one on the ground level and one in the basement, the latter containing most of the auxiliary machinery. The turbine condensers, which are of the Mirrlees Watson vertical surface type, each with 6,250 square feet of cooling surface, are placed here, their upper ends projecting through the main floor a few feet. Each turbine exhausts directly into its own condenser, and each condenser is provided with a steam-driven, two-stage, dry air pump, situated in the basement. Arrangements have also been made for exhausting to atmosphere if necessary.

The circulating water for the condenser is drawn from the Clyde, running by gravity into a large circular well 18 feet in diameter and of a depth below the water level of 9 feet. There are two 30-inch pipes leading into the well from the river, and the water is drawn out through a 36 inch cast-iron pipe by means of a steam-driven centrifugal pump placed in the basement.

After passing through the condensers the water is discharged by a 36-inch pipe into a tank on the bank of the river. The condensed water is pumped into the hotwell, which is also in the basement, by a centrifugal pump driven by a 6 hp. vertical shaft shunt-wound motor running at 625 r.p.m. From here it passes to the suction of the two feed pumps, which are of Messrs. J. and P. Hall & Sons' tandem, compound, double-acting type, each capable of delivering 9,500 gallons per hour against a boiler pressure of 175 pounds. The make-up water is taken from the city mains, that of the Clyde being unsuitable for boiler-feed purposes; there is, however, a stand-by suction from the river for use in case of emergency.



Exciter Sets at Yoker.

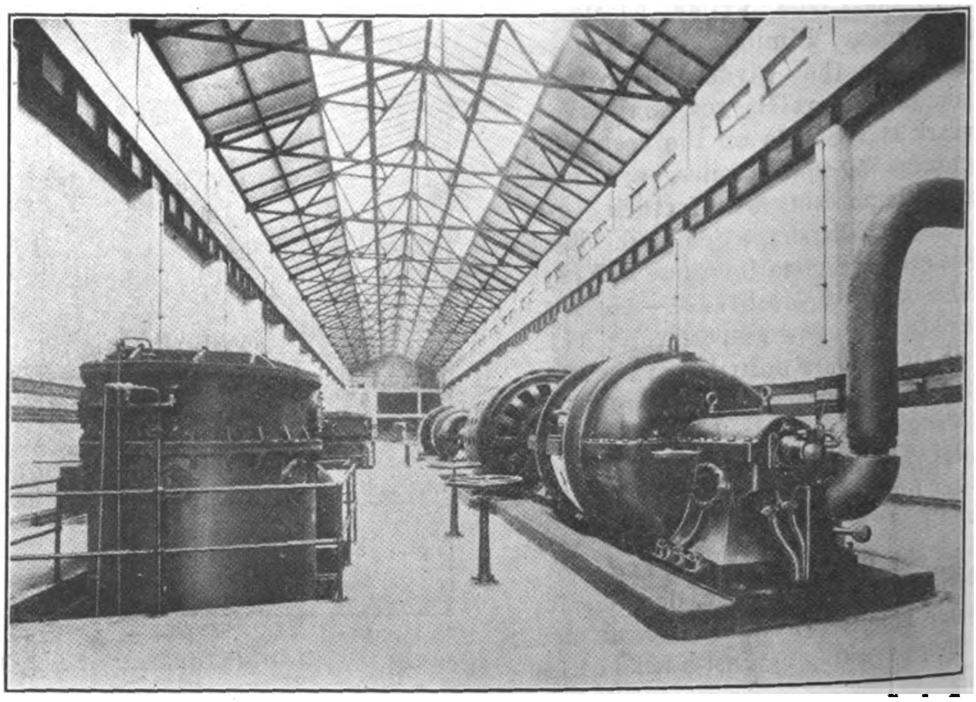
The exciter sets have their separate surface condenser which is of the Worthington Pump Company's make, and has 600 square feet of cooling surface.

In addition to the above auxiliary plant there is installed a feed water heater, having a heating surface of 700 square feet.

GENERATING PLANT.

The upper and principal floor of the engine room measures 252 feet long by 43 feet 5½ inches wide. It is well lighted from the roof, the walls are faced with white glazed bricks, and the floor throughout is paved with Italian mosaic work. At the north end are situated the switchboard galleries and offices.

The main generating plant at present installed consists of two Westinghouse-Parsons steam turbine units, each with a normal capacity of 2,000 kw. and an overload capacity of 3,000 kw. The speed is 1,500 r.p.m., which corresponds to a peripheral velocity of the rotating part of 5 miles per minute. The turbines are of the latest double flow pattern, steam entering at the center and exhausting at both ends, and each contains no less than 20,000 blades. These are securely fixed to the steel drum and are of drop forged steel in the first series, and special metal at the low pressure end so as to prevent corrosion due to the wetness of the steam. The cylinder is of close-grained cast iron, and the rotor consists of a rolled steel drum fixed to the shaft by the aid of forged steel umbrella-shaped disks shrunk into the drum and pressed on to the shaft.



Engine Room at Yoker.

Each of the turbines is directly connected to a 2,000 kw., 11,000 volt, 3 phase, 25 cycle, generator of the rotating field type.

The starting, stopping and speed variations of the generators are under control from the switchboards by electrical means, current for this purpose being taken from the exciters.

The oiling of the turbines is carried out on the gravity system. A large tank in the basement of the engine room receives the oil overflowing from the bearings, which is then passed through coolers and raised by a special oil pump to a tank in the roof of the boiler house, flowing from thence by gravity under a head of 50 feet back to the bearings. Oil pressure gauges are provided on the latter in order to indicate at a glance how the apparatus is working.

The engine room as at present constructed will accommodate one more 2,000 kw. set and a fourth unit of 3,500 kw., which will eventually make the total capacity of the station 9,500 kw. The additional sets will be added as soon as one of the present units is loaded up so that there will be always one spare ready at any moment in case of accident.

The two exciter sets situated at the south end of the engine room are each capable of furnishing the exciting current for both the main generating units at present installed. They are of 75 kw. capacity each, and consist of 11 by x 19 x 11 inches vertical, compound engine, running at 290 r.p.m. coupled direct to a 125 volt compound wound dynamo.

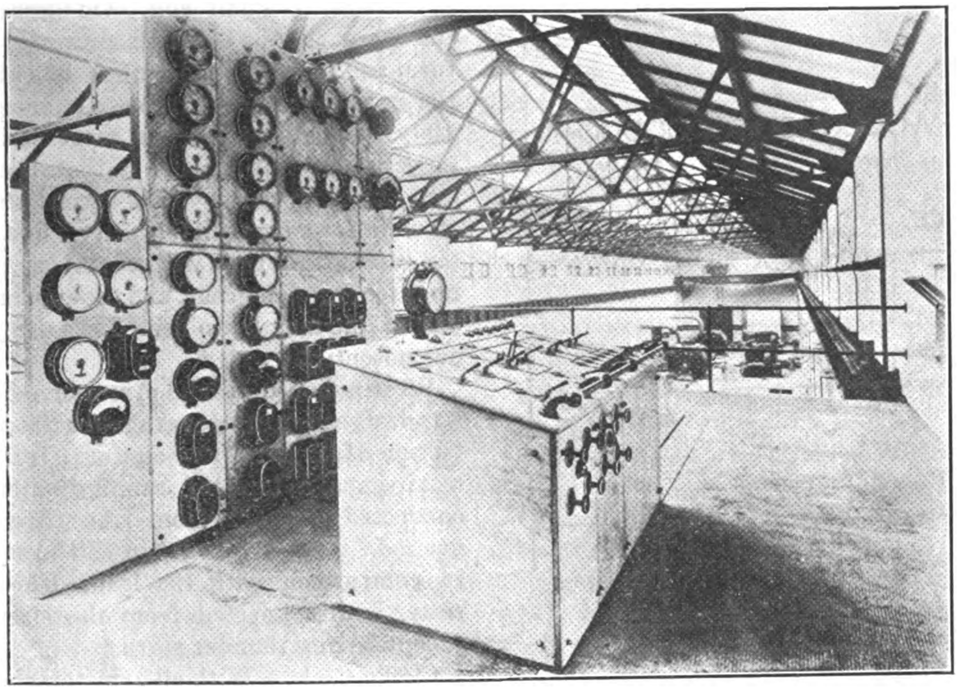
In addition to their natural function these exciters supply current for operating the motors of the coal and ash conveyor, crushers, agitators, economizers, pumps, traveling crane, etc., and also for the electrically operated main and other switches.

The traveling crane in the case of Yoker has a span of 42 feet. It is of 30 tons capacity, of the 3-motor type.

SWITCHGEAR.

The whole of the switchgear is contained in the three galleries at the south end of the engine room. That on the ground floor and the first gallery are devoted to the oil switches and feeders.

On the third or top gallery of the switchboard, are placed the main bus bars in brick compartments and the main controlling board as well as the resistances, etc. Following the latest practice, the control board consists of a small desk directly facing the various instruments, such as ammeters, voltmeters, power factor indicators, relays, etc.



Instrument Board at Yoker.

All the main switches and smaller gear are electrically operated from this desk by the exciter current as before mentioned, and the speed of the turbo-generators and their starting and stopping is also controlled from here.

The Yoker and Motherwell power stations are of the same size and almost identical in arrangement; the foregoing description therefore applies generally to both, with the exception of the condensing arrangements.

DISTRIBUTION.

Six feeders are provided for distribution from Yoker, and all are protected where they enter the building in the basement by lightning arresters.

The cables for supplying power to any part of the district between Clydebank and Scotstoun as well as to Temple are practically finished. They are all laid in duplicate, so that in case of any accident happening to one of them the spare one can be immediately connected while the duplicate is being repaired.

The Clyde Valley Company is authorized to supply in the adjacent Burgh of Clydebank, and for this purpose a special plant has been installed at Yoker consisting of two 150 kw. motor-generator sets. Each set is provided with a small motor coupled direct to the shaft which serves for starting and running up to speed.

The motor-generators are situated in the first switch gallery of the Yoker power station, and the switchboard controlling the distribution to this area is placed on the top gallery.

Both the high and low tension cables for the Clydebank district were supplied and laid by Messrs. W. T. Henley's Co., and the British Insulated Wire Company carried out the extra high tension cable work throughout the entire area.

The number of sub-stations at present installed in the layout of the scheme is ten for the Motherwell district and two for Yoker.

These two districts will not at present be connected in any way, although they may be in the future.

A so-called radium clock, "warranted" to run for 2,000 years, recently came over from England on the Campania for a Rochester, N. Y., electrician.

DESCRIPTION OF THE MAIN PARTS OF STANDARD ARRESTERS.*

BY ALEX DOW AND ROBERT S. STEWART.

ALTERNATING CURRENT.

General Electric Arrester for 2,000 Volts.—Two one-thirty-second-inch air gaps are connected from line to earth in series with a non-inductive high resistance. Cylinders are large, to give a large cooling surface for the arc. The current is kept low by the high resistance used. For protection from stresses between the separate wires of line, half of the gaps are cut out by a bridge connecting the two cylinders which are midway between the line and earth. The arrester thus connected will have the same number of gaps between the lines as from the line to earth. For very high-voltage systems several arresters are connected in series, This arrester should protect very well from ordinary disturbances, but the high resistance does not permit of rapidly dissipating the large amount of energy in a lightning flash.

Westinghouse Arrester for 2,000 Volts.—Six one-thirty-second-inch air gaps are in series from line to earth. Cylinders are made of non-arcing metal. No resistance is used with this when connected to lines fed by 2,200-volt generators of moderate size. When a higher potential than 2,200 volts is used more gaps are used and a resistance is connected in series with the arrester to prevent an excessive current from the generator flowing through the arrester. This arrester protects from severe flashes very well, but as the length of air gap is longer than in the General Electric arrester, a higher difference of potential is required to break down the gap. On discharging a line that has a static charge oscillating waves may be set up in the circuit, since no resistance is used.

These two arresters show how differently two companies will sometimes reason in designing apparatus for the same service.

Westinghouse Low-Equivalent Arrester.—This was designed five years ago in order to cut down the number of gaps required in the standard arrester when used on very high voltage circuits. It consists of a small number of gaps which should break down at a little above the line voltage. In series with these is a high resistance, and shunted across this resistance is a second set of gaps equal in number to the first set. In series with the whole arrester is a small non-inductive resistance, to keep down the main current. Non-arcing metal is used for the cylinders. The operation is as follows: If the potential of the circuit increases, the series gaps break down immediately. As the resistance of these gaps when broken down is small compared with the high resistance in series with them, practically full-potential strain is put on the gaps shunted across this resistance and they will break down. After the static discharge the arc immediately dies out in the shunted gaps, if the arrester is properly designed, and the high resistance cuts the current so low in the series gaps that the arc in these is next extinguished. This arrester combines the good qualities of both those already described for it furnishes a high-resistance path for small static discharges and a low-resistance for violent discharges.

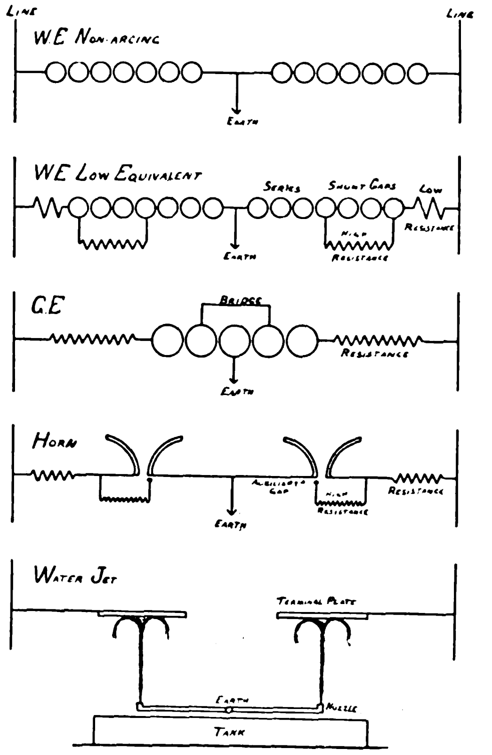
---

*Paper read before the National Electric Light Association at its 28th convention, held at Denver-Colorado-Springs, Col., June 6-11, 1905.

It was the privilege of one of the writers to install the first of these arresters. A considerable amount of lightning trouble had been experienced with a high voltage generator, several generator coils and a transformer having been burned out in a single year. The generator always ran through heavy thunder storms but a little lightning anywhere along the line would cause trouble. The trouble was always due to short-circuits, the discharges never going to earth except through the arresters. The arresters were changed by shunting part of the gaps by a high resistance. No trouble had been reported from this plant three years after this change was made.

Horn Arrester.—This consists of a single large gap, the sides of which are horn-shaped metal pieces to which iron pieces are fastened. The theory of the arrester is that the discharge across the gap sets up a magnetic field, which is distorted by the iron pole pieces. This field draws up the arc which follows the discharge to a point where the field will be symmetrical around the arc. At this point the gap will be so long that the arc will be extinguished, provided the current through the arrester is kept low by a non-inductive resistance. When used on very high voltage systems the air-gap has to be very large to prevent excessive current across the gap. To remedy this fault a small auxiliary gap and a high resistance are shunted across the main gap. When a discharge occurs across the auxiliary gap the heat of this starts an arc across the main gap. This would seem to be a defect, for by the time the arc had started across the main gap all the damage might have been done by the static wave. The reports concerning this arrester are too meagre for us to judge of its operation. It is used on several lines in Europe, but has been tried very little in this country.

Water Jet Arrester.—Water jet discharge devices have been used on some of the high-voltage transmission lines in Europe, and these are reported to be operating very satisfactorily. Jets of water are thrown from a grounded nozzle against terminal plates that are connected to the several wires of the circuit. These columns of water furnish high non inductive resistance paths from the line to earth for any static waves. The power lost is said to be about three kilowatts, and the water used less than one gallon per minute. It would seem that the resistance of the water columns must be so high that it could not dissipate the energy of a violent disturbance with sufficient rapidity.



LIGHTNING ARRESTER DIAGRAMS.

Direct Current Arresters.—In direct current service the arc formed by a discharge is much harder to extinguish than in alternating current service. Fortunately, however, direct current voltages are usually small.

Thomson Magnetic Blow-Out Arrester.—In this the single air-gap is between two metallic horns. An electro-magnet is placed with its poles opposite the lower extremity of the gap. This magnet is excited either by the discharge current or by the main-line current. The magnetic field set up blows out the arc immediately. The operation of this arrester is very satisfactory.

Westinghouse Direct Current Arrester.—This is built in accordance with the principle that if the voltage across a gap is very low no arc will be maintained in the gap. A large number of minute gaps are connected in series. Carbon particles are used to form the sides of these gaps. It is necessary in this arrester to keep the lines of carbon particles protected from the air, or an arc will be carried across the air above the carbon and will burn up the arrester. The objection to this arrester has sometimes been made that its operation has to be taken on faith. There is no evidence of discharge unless one is observing the arrester at the time of discharge. Tell-tale papers in a small auxiliary gap connected in series with the arrester would be advisable.

Garton Arrester.—Two gaps are connected in series with a non-inductive resistance. Shunted across part of this resistance is a small coil. On discharge the current in the coil lifts an iron armature, and increases the length of one of the gaps so much that the arc is immediately extinguished. The most serious objection to this arrester is that it contains moving parts. If a second static wave follows immediately after a first the air-gap at this time will be so long that no discharge can occur, and the apparatus on the line may be subjected to a dangerous potential.

Westinghouse Tank Arrester.—This was designed many years ago for the protection of large railway stations. Instead of air-gaps, a tank of running water is connected directly from the line to ground. The current taken will be small in comparison with the load. The arrester is disconnected from the circuit, except during thunder storms.

Choke Coils.—With all arresters choke coils are placed between the arrester and the apparatus to be protected.

A coil of wire offers opposition to the passage of an electric discharge through it. The more sudden the discharge the greater will be the opposition. The opposing EMF. in the choke coil may be so high that the path across the air-gap of an arrester will be easier than through the coil. In the case of lightning the discharges are either very sudden or they are oscillatory discharges of very high frequency, and a coil which offers practically no opposition to the main current is sufficient. The potential at a choke is greater than it would be if the coil were not present, for the potential is the resultant of the advancing wave and of the wave that is reflected by the coil. This resultant will always be greater than that of the advancing wave alone. It is standard practice to divide a choke coil into several parts and to place arresters between these so as to furnish paths to earth for any discharge that has passed the first arrester.

Distribution of Arresters.—In long-distance transmission the lines need no protection and the arresters are grouped at the two ends of the line. Several choke coils are used, and the arresters are connected to the line at several places between the coils, so as to be sure that some of the arresters will be at a maximum point of a static wave.

In distribution networks arresters should be scattered all over the network. There is no general rule as to the number necessary, except that the more arresters installed the better the protection.

In low-voltage networks that are tied together in many places, if one branch extends some distance from the network, weak spots near the end of the branch are punctured by discharges during thunder storms. Experiments with static machines and small networks of conductors showed the same phenomenon many years ago. A static wave traveling down the conductor is reflected back at the end of the conductor. The resultant of the advancing and reflected waves gives at the end of the line a potential strain that is double that of the advancing wave.

The remedy is to put choke coils in the branch at the point where it is connected to the network. The wave in the network will then be divided at the coil, part being reflected at this point and only a small part advancing along the branch.

Overhead Ground Wires.—In many long-distance transmission systems the lines are protected by ground wires strung above the lines. These ground wires are connected to earth every thousand feet. The theory is: If lightning strikes the line the ground wire would be struck directly instead of the line wires that are insulated from ground. As the earth's potential is above and also below the line wires these cannot be charged with static to a high potential. The inductive action of lightning on the line is much reduced, as the ground wire is much nearer the line than the earth is.

There is one case in which ground wires are of no service. If the earth and a cloud are charged, the line is charged to the same potential as the earth. If a disruptive discharge occurs, the line, being insulated from earth, is discharged much more slowly, and there may be a great difference of potential between the line and earth. Arresters would be required to protect the line from such strains. A ground wire is also no protection from strains caused by high-frequency waves that are set up in a circuit by sudden changes of load or by resonance.

The result of years of test has been favorable to ground wires in many cases. It is particularly noticeable that on lines provided with ground wires poles are not split by lightning.

Theoretically, barbed wire should be used for an overhead ground wire, as the points of the barbs draw off the charge from the suroundin air. The action is the same as that of the comb in a static machine. In practice, however, there does not seem to be any gain in the use of barbed wire. It is very difficult to string on poles, the points are far from being theoretical points, and the wire is of a poor grade. These disadvantages more than offset the theoretical advantages. A good construction would be No. 8 B. & S. gauge E.B.B. wire, strung on glass insulators, and grounded every thousand feet. The two outside pins on the top cross-arm are sometimes used for ground wires, but as the construction is expensive and there is some difficulty in connecting the wires to ground, a single ground wire, either above or below the circuit, is more frequently employed. Glass insulators are used so as not to subject the pole to any unnecessary electric strain from the line.

Conclusion.—There is still much to be done before we can claim to have our lines perfectly protected. The engineers of the manufacturing companies have developed apparatus that operates successfully under ordinary conditions, but each transmission line is a separate problem and can only be solved empirically. Complete records of static troubles and, so far as can be determined, their causes, should be kept by the different power companies to show how their apparatus is affected by the local conditions.

Automatic Ticket-Machine.

An interesting application of the slot principle has been made in England, where the Lancashire & Yorkshire Railway Company has introduced an automatic ticket-machine at a point where a large number of tickets for a neighboring station are sold. The machine is of simple construction, and when the coin is dropped into the slot and a handle pulled the ticket is dropped into an open receptacle. If the machines prove successful in operation it is proposed to install a large number at suburban stations, not only with the purpose of relieving the ticket office, especially during rush hours, but to enable passengers to purchase their tickets more speedily without waiting in a line at the window.

ELECTRICITY LEAFLETS.

BY NEWTON HARRISON, E. E.

THE TRANSMISSION OF POWER.

Efficiency in Transmission.—Whether direct or alternating current is employed, the efficiency or percentage of power returned, from the total sent into the line, demands attention. The problem of transmitting 100 hp. a given distance requires consideration based upon the conditions as follows: The drop in the line, the power wasted in the line, the pressure, the cost of copper employed, the relation between the cost of copper and the power wasted in transmission, and other data of importance. To examine a specific case according to the general ideas prevailing, take 100 hp. transmitted a distance of one mile with 10 per cent. drop. If the engine or turbine shows 100 indicated horse power, then the dynamo transforms 95 per cent. into electrical energy. When 95 per cent. or 95 hp. enters the line only 90 per cent. is delivered at the other end. The power delivered at the distant end of the line is 95 hp. minus 9.5 hp., leaving a balance of 85.5 hp. The process is not complete as yet, although the power is now at hand, ready for use. It is necessary to transform it again into mechanical energy. This transformation roughly involves a loss of from 5 to 10 per cent. This being the case the balance left will be the difference between 85.5 — 8.55 = 76.95 at 10 per cent. loss in the motor, or the difference between 85.5 — 4.275 = 81.225 per cent. at 5 per cent. loss in the motor. The efficiency of transmission in any case, with 100 hp. at one end, and the loss throughout in dynamo, line and motor of 10 per cent. apiece respectively, will be about 77 per cent. The 100 hp. is thus reduced to 77 hp. from the beginning to the end of the system. The question arising in connection with this subject is that of the cost of transmission. The actual transmission can be readily accomplished if the cost is not prohibitive, but in instances where this threatens to be the case, certain means must be employed to raise the efficiency and reduce the cost of installation.

A Higher Efficiency and a Lower Cost. —When power is subtracted from the total amount sent into the line, it disappears in the form of heat. It is called the C^2R loss, and is due to the degradation of electrical energy through resistance. This loss is serious in character and increases rapidly with any increase in current in the line. The relationship of power loss in transmission, to the number of amperes in the line, is shown by the following figures:

Amperes.	Volts.	Distance in Miles.	Resistance in Ohms.	Total Drop in Volts.	Loss in Heat in Watts.
10	1,000	1	10	100	1,000
9	1,111	1	11	99	891
8	1,250	1	12	96	768
7	1,428	1	13	91	637
6	1,667	1	14	84	504
5	2,000	1	15	75	375
4	2,500	1	16	64	256
3	3,333	1	17	51	153
2	5,000	1	18	36	72
1	10,000	1	19	19	19

The above figures illustrate the influence of a diminishing current and an increasing resistance upon the losses experienced in the line. The amperes are shown to diminish systematically, the volts to increase in like manner, but the total amount of power is kept constant. The loss of watts due to the current and resistance is shown to diminish with increasing voltage and even with increasing resistances.

The greater losses are those involved in the use of a heavy current. One of the axioms therefore of power transmission is that of keeping the current at a minimum. The conclusion to be drawn from this proposition is that the only way in which the watts wasted can be limited is by the employment of high pressures in transmitting the power. In the first line of figures given, the total drop with 10 ohms and 10 amperes is 100 volts. It is readily seen that 100 volts drop with 10 amperes in the line would mean the loss of 1,000 volts. The loss in volts and the loss in power are equally indicators of the percentage of power dissipated. For instance, a loss of 100 volts out of 1,000, shows a waste of 10 per cent. Similarly a resistance of 10 ohms causing this 100 volt drop causes a waste of 1,000 watts of power or 10 per cent. of 10,000 volts, the total power to be transmitted.

Effects of an Increased Pressure.—The transmission of power over a line in which the following conditions occur will illustrate another feature in connection with this subject. Suppose a power line a mile in length is erected whose total resistance is 2 ohms. If 10 kilowatts of power are to be transmitted at a pressure which is to be varied to obtain the most economic results, then the following considerations must be observed: The effect of an increasing pressure—the total amount of power remaining the same and the resistance of the line not varying—will be that of greatly improving the operation of the system. This improvement will manifest itself in a reduced loss in transmission, collectively represented by less drop and therefore less loss in heat. In the case specified 10 kilowatts of power represent 10,000 watts, which, at a pressure of 100 volts, will call for a current of 100 amperes. In a line whose resistance is 1 ohm, the total energy would be wasted in heat and the total pressure in drop. This is readily shown by squaring the current and multiplying it by the resistance, or 100 × 100 × 1 = 10,000 watts dissipated in heat, or 100 × 1 = 100 volts lost in transmission. This entire degradation of the sum total of power into heat illustrates a case in which the efficiency is zero. There is no return at the other end, and the line therefore, with respect to the conditions under which the power is being transmitted, is totally unsuited to the particular pressure employed. To carry out the idea further, let the pressure be raised to 10 times its value, which is 1,000 volts. Let the results of this change be carefully examined with respect to the applicability of the line as it is at present, that is, 1 ohm resistance. Under these circumstances 10,000 watts at 1,000 volts would mean a current of 10 amperes. At 1 ohm resistance, as stated in the line, the drop would be 10 × 1 = 10 volts. The loss in heat would be 10 × 10 × 1 = 100 volts. The influence of pressure therefore is manifested as follows: The increase of pressure to 10 times its original value, namely, from 100 to 1,000 volts, has had the effect of reducing the heat loss from 10,000 watts, representing the waste of all the power, to 100 watts, or only 1 per cent. of the power. Raising the pressure to 10 times its value has reduced the loss down to $\frac{1}{100}$ of its value. This relationship will be clearly shown in other ways in connection with power transmission problems. The fundamental fact is thus presented, that if the resistance of a line remains constant and the power constant, but the pressure increases, the loss becomes reduced inversely as the square of the pressure. According to this statement, doubling or tripling the pressure, the total power and line resistance remaining the same, means a reduction of the heat loss to $\frac{1}{4}$ or $\frac{1}{9}$ of its value with the original pressure.

TABLE SHOWING THE EFFECT OF A HIGHER PRESSURE IN TRANSMISSION.

Amperes.	Total Watts.	Volts.	Resistance of Line in Ohms.	Distance in Feet.	Drop.	C^2R in Watts.
1,000	100,000	100	10	50,000	10,000	Complete loss.
500	"	200	"	"	5,000	" "
250	"	400	"	"	2,500	" "
200	"	500	"	"	2,000	" "
100	"	1,000	"	"	1,000	100,000
50	"	2,000	"	"	500	25,000
40	"	2,500	"	"	400	16,000
25	"	4,000	"	"	250	6,250
20	"	5,000	"	"	200	4,000
10	"	10,000	"	"	100	1,000
5	"	20,000	"	"	50	250
2.5	"	40,000	"	"	25	62.5
1.0	"	100,000	"	"	10	10.0

The efficiencies will rapidly rise according to these figures as soon as a point is reached where the better effects of an increased pressure can make itself felt. The dead loss experienced in a 10-ohm line is felt all along until 1,000 volts have been passed. At this point 100 amperes are employed to give the full quota of power. The loss is complete however in the line. One thousand volts disappear as pressure, and 100,000 watts as power. With an increase in pressure, however, the conditions change for the better. The pressure is doubled, which would mean, according to the principle outlined, that the loss becomes one-quarter. Following the 2,000 volt pressure along to the loss in watts, it is seen that the dissipation of energy has become only 25,000 watts. Passing from the 1,000 volts with 100,000 watts loss, to four times the pressure or 4,000 volts, the loss is shown to be $\frac{1}{16}$ or only 6,250 watts. Following the 4,000 volts up to 10,000 volts, the loss becomes $\frac{1}{100}$ or only 1,000 watts. The immediate practical value of high pressures in power transmission is thus exemplified in showing as well the small loss in volts. Power transmission under these circumstances becomes a matter of high pressure to be successfully conducted and, as naturally follows, a matter of high grade insulation. The efficiency with 1,000 volts is zero in the foregoing table; with 2,000 volts it becomes 75 per cent.; with 4,000 volts it becomes 93¾ per cent., etc. These ideal figures merely serve to show the trend of an intelligent practice. When everything is considered, the efficiency falls very much lower though the chance of sustaining it lies in the pressure and line resistance. The decision regarding the line resistance is really a conclusion regarding its cost as copper. It does not take into consideration the cost of high grade insulators. It leaves out the question of poles and the cost of installing them. In fact, the principal problems are those, which, when solved satisfactorily in an electrical sense, call for financial consideration. The problem of the line becomes a fourfold one with regard to the engineering difficulties involved.

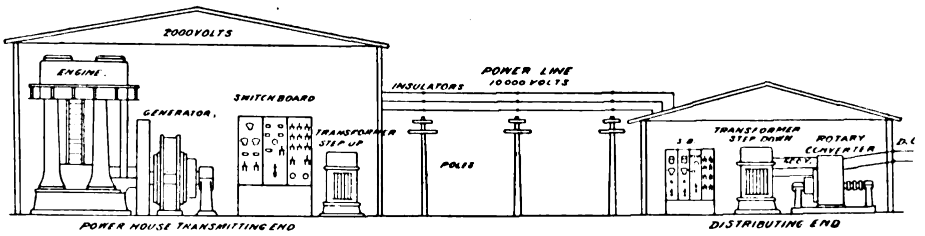
These might be included under the headings as follows:

Line	Resistance. Pressure. Insulation. Installation.

The resistance of the line largely determines the best pressure at which economical operation can be expected, or vice versa. The pressure determines the quality of the insulation and this and the other two the character and cost of the line as an installation.

Generating the Power.—The fact that a high pressure is necessary in developing useful power for transmission; that it must be transformed up or down, as the case may be, and that a commutator is absolutely out of the question for pressures beyond a certain point, leads inevitably to the conclusion that the only solution to this problem is to be found in the application of an alternating current. Here again a difficulty arises of a most important character The simple alternating current, though readily generated and transformed is hardly suited to the purposes ultimately held in view, namely, the transformation of electrical into mechanical energy. A simple alternating current motor, whose use in the conversion of alternating into direct or direct into alternating currents is so necessary, will not operate in its generally accepted form. Recourse is had to the two and three-phase alternating current for such purposes. These currents are serviceable in the use of self-starting economical motors for power transmission purposes. The power generated, therefore, must be in such a form that the accomplishment of the purpose in view can be successfully carried out.

Modern power transmission plants consist of a complete equipment consisting of two or three-phase alternators, step-up transformers, oil switches and either water power as an original source of energy or steam. The receiving or distributing end of the system holds step-down transformers and rotary converters. If the current is to be distributed simply as an alternating current useful for power purposes, no rotary is necessary. The essentials of a power house, and those of the distant end of the plant, are so related that the efficiency is preserved in every reasonable manner possible. Yet in spite of such precautions, the use of an alternating current, though absolutely necessary in power transmission, presents difficulties.



Elements of a power transmission plant for street railway service.

Use of Transformers.—The alternating current readily lends itself to the ready transformation of pressure up or down. The transformers stepping up the pressure or stepping it down are called "step-up" or "step-down" transformers. They serve the function in the power house of raising the pressure to the proper point for transmission. All of the energy enters them at one end of the circuit. Before it is handled for distribution it is sent through another set and "stepped down" to a safe pressure. The entire process, one very vital to the efficiency, is carried on in the following machines: In the engine or water wheel, in the generator, in the transformer, in the line, in the rotary converter and then into the city distributing lines. This may be represented in the following manner:

Power House.		Distributing Station.
Engine. Dynamo. Switchboard. Transformers, step up.	Line.	Transformers, step down. Rotary Converters. Street Lines.

If some estimate is made of the net results of the process from the standpoint of efficiency, based upon a general efficiency of 90 per cent. per machine throughout the plant, the figures would show a lower efficiency than would be anticipated at first glance. Taking 1,000 hp. in the engine, the dynamo would yield 900 hp., the switchboard and transformers 10 per cent. less, or 810 hp.; the line 10 per cent. less, or 729 hp.; the transformers 10 per cent. less or 656 hp., and the rotary converters and street lines, 10 per cent. less, or 590.4 hp.

Criticism could of course be justly made of this uniformly sweeping rating, but it serves the purpose in showing how a slight gain in the dynamo, transformers or line of distributing station will accrue to the benefit of the total efficiency. The erectors of our large plants claim higher percentages of efficiency than this, but a 30 per cent. loss is not to be considered as very large from end to end.

WRINKLES.*

EDITED BY H. C. ABELL.

Three-Wire Underground Services.

In making three-wire underground connections to buildings, either from pole line or underground conduit, run duplex rubber-covered, lead-cased wire, fore the outside wires, and bare copper wire, either stranded or solid, depending upon the size, for the neutral; all to be run in wrought-iron pipe, either red-leaded or asphalted inside and out. This makes a cheaper service connection than if the three wires were all insulated, and also helps to ground the neutral better than is apt to be the case where the only secondary grounding done is by digging a hole at the foot of the pole, where the soil may or may not be damp at all times.

P. C. Brown, Brookline, Mass.

A Scheme for Operating 1,100-Volt Series Incandescent Circuit from a 2,200-Volt Circuit.

Upon changing the primary voltage from 1,100 to 2,200 volts, the question came up of what to do with the series incandescent street circuits in one of the suburbs of Denver. To change these circuits to 2,200 volts would entail considerable expense and time. It was overcome as follows:

A tap was brought out from the middle point of the primary coil of a 4-kw., 1,100-

---

*Paper presented before the National Electric Light Association at its 28th convention, held at Denver-Colorado Springs, Col., June 6-11 1905.

2,200-volt, shell-type transformer; the street circuits were connected between this neutral and the outsides, and balanced as nearly as possible. The 2,200-volt feed was connected to the two outsides. The voltage was found to be a little low on one side, so the circuits on this side were connected in series with the secondaries of the same transformer, and the voltage thus boosted. The balancing set, as it might be called, has been in operation for two years and has never given a particle of trouble.

J. F. Dostal, Denver, Col.

Transmission Line.

During the past year we contracted to furnish a large amount of power to a dredging company situated about 11 miles from our station. This power was transmitted at 11,000 volts, three-phase, 60 cycles and stepped-down to 370 volts and fed directly to a synchronous converter.

As the dredges were to be moved about considerably, we built a small wooden transformer house of sufficient size to hold three 50 kw. transformers and lightning arresters. This house was mounted on a wooden sledge and by means of a team of horses can be easily moved about. In order to allow the dredge considerable travel without necessitating the moving of the transformers, the secondary leads were brought out of one end of the transformer house in the shape of a single triple-conductor, rubber-insulated flexible cable. This cable lies on the ground and often lies partially submerged in water. In order to better protect the cable an ordinary fire hose of extra quality was slung on over the cable. This arrangement has now been in operation for about 8 months, and thus far it has given perfect satisfaction.

C. W. Humphrey, Denver, Col.

Home-Made Oil Switches.

A short time ago it became necessary to have some oil switches on short notice. We had some old air-brake feeder switches on hand, so we made some tin boxes, filled them with oil and put the old switches in the oil—the switches being placed in a horizontal position with handles at right angles—and led the high-tension wires in through porcelain tubes. This scheme was very satisfactory.

G. F. Willard, Denver, Col.

A Scheme to Bring Up Potential for Alternating Current Series Arc Circuits.

The tub transformer broke down, but we had six old transformers, so we connected the primaries of three of them in parallel across the mains, and the secondary of each was connected to the secondary of one of the other three, and the primaries of the last series were all connected in series to the arc circuit.

G. F. Willard, Denver, Col.

LIEGE ENGINEERING CONFERENCE.

(Special Correspondence of "Electricity.")

At the Liege meeting of the British Institution of Mechanical Engineers, held on June 20-23, some noteworthy papers were read. One was devoted to the subject of "Electric Winding Machines," and was prepared by Prof. Paul Habets of Brussels. Considerable attention was devoted to the dynamic investigation of haulage, and the starting properties of electric motors for haulage work. A full description was given of the electrically-driven winding machines at the pit of St. Nicolas at the collieries of Esperance & Bonne-Fortune, Montegnee, also of the results of a series of trials made, with the object of giving an account of the performance of the Ilgner system; also of testing the consumption guaranteed by the contractor, and of determining the consumption of energy under actual working conditions. The trials were made in January this year, and in Prof. Habets' opinion, it is safe to conclude from them that the electric haulage machine, even if it is not more economical than the best steam-driven machine, is certainly not more expensive. The greater facility and safety with which it can be manipulated, the smoothness with which it works and its much greater flexibility, will often make it preferable to the steam-driven machine, even in the case where transmission of energy is not required, and Prof. Habets says "there can be no hesitation in the choice between the two systems, when the power to be transmitted from a distance, or, as in the case of the pits of St. Nicolas, where the production of energy can be centralized at one power station."

Effects of Steam Jacketing.

One other paper read at the conference should have mention here. It consisted of an account of interesting investigations which have been made upon the experimental engine at the Municipal School of Technology, Manchester, Eng., by Mr. A. L. Mellanby with a view to determining the effects of steam jacketing upon the efficiency of a horizontal compound steam engine. The following is a summary of the most important results obtained:

Best Mean Pressure.—The compound engines with a boiler pressure of 150 pounds may be worked with a mean pressure referred to the low pressure cylinder of about 40 pounds per square inch without any loss of efficiency in terms of the brake horse power.

Maximum Efficiency.—That the jackets have their maximum efficiency when the whole of the high pressure and the ends of the low-pressure cylinders are jacketed with high pressure steam.

Variation of Indicated Horse Power.—That when the jackets are applied to the high pressure cylinder the total indicated horse power is slightly reduced, but when applied to the low pressure cylinder the total indicated horse power is considerably increased.

Initial Condensation.—That the jackets have little effect in the high-pressure, but have a considerable effect in the low-pressure cylinder upon initial condensation.

Temperature-Cycle of Metal.—That the temperature-cycle of the cylinder walls next to the steam must be considerably less than that of the steam.

1. Because the actual missing quantity is much less than it would have been had the steam and metal gone through the same temperature changes.

2. Because the mean temperature of the metal is higher than that of the steam.

Missing Quantity.—That the greater part of the "missing quantity" must be due to leakage and not to initial condensation.

1. Because the application of the methods suggested by Callendar and Nicolson shows the condensation to be but a small fraction of the total missing quantity.

2. Because the apparent re-evaporation during expansion is less for jacketed than for unjacketed engines.

Report of New York's Municipal Lighting Committee.

Messrs. Cary T. Hutchinson, Nelson P. Lewis and George F. Sever, the special committee appointed last fall by Mayor McClellan to prepare plans for a lighting plant to furnish all the public lighting for New York City, has submitted its report to the Board of Estimate. The committee estimates the initial cost for the acquisition of property and equipment of plant at $7,567,000. It places the operating expenses at $1,269,000 annually and the cost of each arc light at $64.07 per year, compared with $146 at the present time, while for incandescent service the cost is estimated at 5.5 cents per kilowatt hour, against 10 cents, the present basis. The committee points out several ways in which a material reduction can be made in the cost, in such a manner as to effect a saving of $1,481,000 annually to the city through the operation of its own lighting plant, or an amount equal approximately to 20 per cent. of the initial investment. The report was referred to Nelson P. Lewis, chief engineer of the board, and Controller Grout.

Alleged Discord in the American Institute of Electrical Engineers.

Leading members of the American Institute of Electrical Engineers ridicule the story published in the New York "World" on Sunday, "that revolt divides the Institute." The article in the "World" is as follows:

"There is dissension within the ranks of the American Institute of Electrical Engineers.

"The complaint comes from the members at large. It is said, sub rosa, that the Institute is no longer national in its scope, but has become a local affair, in that all the officers at present are interested in matters in the city of New York rather than in the country at large, and the plea among many members is, that the New Yorkers in the organization are running the society.

"'About the size of it,' said a member yesterday, who did not wish to have his name published, 'is that the highest offices in the Institute are being hogged right along by the New York City men. We fellows in the country are trying to get along without anything but hope. We think it is time to give us a show at other things. We don't want New York City to get it all.'

"Those posted as to the inner workings of the organization say that President Lieb has sought for some time to smother the revolt by striving to change the Institute's constitution so that the selection of nominees for office could be made by a committee that would have a membership representing the different sections of the United States.

"It is pointed out, however, by the dissenters that the Institute's existing constitution contains specific provisions for the geographical distribution of offices, but that these provisions have been flagrantly violated or deliberately ignored.

"'Another point to consider' said another member last night, 'is that New York members have time and time again been selected for high offices at the expense of out-of-town members, although they have received a smaller number of nominating votes than out-of-town members.'

"The feeling is so bitter that some of the outside members are talking of breaking away from their New York brothers and forming a new organization."

Electrical Contractors' Convention.

The fifth annual convention of the National Association of Electrical Contractors will open in Mechanics Building, Boston, on Saturday evening, July, 15. A reception committee will be at headquarters Saturday, Sunday and Monday, and will meet the specials due from New York and the West on Tuesday afternoon and evening.

The open session of the convention on Wednesday will be a notable event. Addresses of welcome will be delivered by F. L. Barnes, president of the Massachusetts State Association; by Governor Douglas in behalf of the State, and Mayor Collins in behalf of the city. E. McCleary of Detroit, Mich., president of the National Association, will then deliver the annual address, after which will come several other addresses.

An executive session of the National Association will be held Wednesday afternoon, and the annual dinner to the members of the National Association will be given in the evening. Thursday forenoon will be devoted to a session of the association. Friday will be given to executive sessions of the National Association and Saturday will be spent in sightseeing and entertainment.

New York Street Railway Association Convention.

The 23d annual convention of the Street Railway Association of the State of New York was held June 27–28 at the new Fort William Henry Hotel, Lake George. The meeting was called to order by the president, C. Loomis Allen of Utica, who gave an address of welcome, after which several interesting papers were read on practical subjects. H. W. Blake of New York held the close attention of the delegates during the reading of his paper on "Contrast Between Company and Municipal Ownership of Public Utilities." J. Harvey White of the Boston Elevated system presented a paper on "Publicity." The general programme was concluded by a question box conducted by C. B. Fairchilds.

The following officers were elected for the ensuing year: President, R. E. Danforth, Rochester; first vice-president, B. B. Nostrand, Jr., Peekskill; second vice-president, J. H. Pardee, Canandaigua; secretary, C. B. Fairchilds, Jr., New York; treasurer, William W. Cole, Elmira; executive committee, E. F. Peck of Schenectady, T. M. Wilson of Buffalo, Oren Root, Jr., of New York, and J. N. Shanahan of Gloversville.

ELECTRICAL PATENT RECORD.

LETTERS PATENT ISSUED JUNE 27, 1905.

Electric Railways and Appliances.

793,304. Trolley-Wheel and Guard Therefor. Fridolin Koenig, Newark, N. J., assignor of two-thirds to Charles Koenig, same place, and Fridolin Koenig, Jr., New York City. Filed Dec. 17, 1904.

793,312. Automatic Trolley-Pole. Alfred W. Morgan, Longbeach, Cal. Filed Jan. 30, 1905.

793,343. Car-Fender. Peter Best, Elizabeth, N. J. Filed Sept. 27, 1904.

793 344. Trolley-Base. Peter Best, Elizabeth, N. J. Filed Sept. 29, 1904.

793,430. Trolley. David C. Evans and Oliver O. Patterson, Uniontown, Pa. Filed March 15, 1905.

793,479. Switch for Electric Railways. Carl Voss, New York City. Filed April 1, 1905.

793,480. Electrically-Operated Railway-Switch. Bryan S. Wakeman, Scranton, Pa., assignor, by direct and mesne assignments to the Scranton Electrical Switch & Signal Company. Filed Aug. 30, 1904.

Electric Lights and Appliances.

793,211. Method of and Apparatus for Finishing Electric Lamps for Bulbs. George P. McDonnell, St. Louis, Mo., assignor to the American Electric Company, East Orange, N. J. Filed Nov. 9, 1904.

793,440. Arc-Lamp Yoke. Charles E. Harthan, Lynn, Mass., assignor to the General Electric Company. Filed Dec. 13, 1902.

Electrical Machinery and Apparatus.

793,066. Electric Switch. Monroe Guett, Hartford, Conn., assignor to the Hart & Hegeman Manufacturing Company, same place. Filed Nov. 1, 1904.

793,429. Electrically-Operated Hydraulic Valve. Carl Engberg, St. Joseph, Mich., assignor to the Engberg Electric & Mechanical Works, same place. Filed Feb. 23, 1904.

793,454. Multiple-Switch Rheostat. Frederick Mackintosh, Schenectady, N. Y., assignor to the General Electric Company. Filed Dec. 5, 1903.

793,474. Brush-Holder and Brush-Holder Support. Leonard A. Tirrill, Lynn, Mass., assignor to the General Electric Company. Filed Nov. 28, 1904.

793,491. Maximum-Current Indicating Device. Maurice J. Wohl, Brooklyn, N. Y., assignor to the General Electric Company. Filed Nov. 21, 1904.

793,493. Rheostat. William C. Yates and Alexander M. Fenwick, Schenectady, N. Y., assignors to the General Electric Company. Filed Sept. 26, 1904.

793,570. Motor-Controlling System. Arthur C. Eastwood, Cleveland, O. Filed April 15, 1905.

Telephones and Telephone Apparatus

793,325. Noise and Lightning Arrester for Telephone-Wires. Alexander Stiles, Martinsville, Ind. Filed Nov. 10, 1903.

783,398. Telephone Service-Meter. Frank R. McBerty, Evanston, and James L. McQuarrie, Chicago, Ill., assignors to the Western Electric Company. Filed Nov. 19, 1902.

Miscellaneous.

793 063. Electrical Instrument. John J. Ghegan, Newark, N. J. Filed Jan. 27, 1904.

793,076-077-078. Anode and Cathode-Plate for Batteries, Harry C. Hubbell, Jersey City, N. J. Filed Oct. 3, 1904.

793,093. Battery-Grid. Henry C. Porter, Waukegan, Ill., assignor to the Vesta Accumulator Company, Chicago, Ill. Filed Aug. 19, 1904.

793,117. Storage-Battery Jar. Thomas S. Witherbee, Jersey City, N. J., assignor to the Witherbee Igniter Company. Filed March 12, 1904.

793,158. Electric Heater. Charles A. Rolfe, Adrian, Mich., assignor, by mesneassignments, to the Rolfe Electric Company, Rochester, N. Y. Filed Nov. 14, 1903.

793,188. System of Electrical Distribution. Charles M. Green, Lynn, Mass., assignor to the General Electric Company. Filed Nov. 3, 1897.

793,244. Electric Signalling System. Herbert B. Taylor, East Orange, N. J., assignor to the Advance Signal Company, Newark, N. J. Filed Sept. 1, 1904.

793,313. Insulator. Bertie B. Moss, Pekin, Ind., assignor to Leander G. Davis and Milton Hottel, Salem, Ind. Filed Feb. 1, 1904.

793,329. Relay. Herbert B. Taylor, Newark, N. J., assignor to the Advance Signal Company, Newark, N. J. Filed Dec. 4, 1903.

793,424. Electric Oven. Levitt E. Custer, Dayton, O. Filed 14, 1904.

793,445. Lightning Arrester. Thomas J. Johnston, Brooklyn, N. Y., assignor to the General Electric Company. Filed Nov. 8, 1901.

793,513-514. Circuit-Controlling System. Arthur C. Eastwood, Cleveland, O. Filed Dec. 19, 1904, and April 15, 1905.

THE TELEPHONE WORLD.

Keystone Telephone Company's Bonds.

Fisk & Robinson are the head of a syndicate of New York and Boston bankers who have recently underwritten an issue of $4,000,000 5 per cent. 40-year coupon or registered bonds of the Keystone Telephone Company of Philadelphia. The bonds were issued for the purpose of retiring the company's floating indebtedness and to provide funds for development work. This issue is the first lot of bonds which has been put out and constitutes a first lien on the property of the company.

The company has a perpetual franchise and has outstanding $6,000,000 common stock and about $2,000,000 6 per cent. cumulative preferred stock. The bonds will be sold largely in Philadelphia and New York. Such bonds as are to be sold in Boston will not be offered to investors until some time in the early part of July.

At a recent meeting of the Vallejo, Cal., city board of trustees, Attorney Frank R. Devlin, of that city, filed a petition asking that the board advertise the sale of a franchise to maintain through the streets of Vallejo for the period of 50 years a telephone system. Mr. Devlin refused to disclose his plans, but says that the new company will install a system on the lines of the new "Home" telephone system. It is believed the new $4,000,000 incorporated company, composed of the most prominent capitalists in San Francisco, is behind Mr. Devlin and intends to build in cities other than San Francisco. The Pacific States Telephone Company is preparing to meet the new line by spending nearly $20,000 to entirely rebuild the Vallejo system.

The People's Line Telephone Company, of Ontario County, held its annual meeting in Canandaigua, N. Y., last month and elected the following named officers for the ensuing year: President, Hector W. Blake, Naples; vice-president and general manager, John Litzendorf, Honeoye; secretary, George B. Hemenway, Naples; treasurer, George R. Granby, Naples; directors, D. O. Pierpont, Richmond; E. C. Church, Canandaigua; R. B. Abbey, Richmond.

The Sleepy Eye, Minn., Telephone Company, recently organized with a capital of $25,000, has begun active work in extending lines through that section of Brown County. It has completed one line running south of Sleepy Eye to Lake Hanska, about 15 miles.

Articles of association were lately filed by the Holton, Mich., Rural Telephone Company. The capital stock is $5,000. Herbert O'Connor owns 498 shares, and his brothers, Herman and Wiley, one share each,

The Harrah, Okla., Telephone Company is a newly organized concern capitalized at $5,000. The incorporators are Karl Haas and Marion Platt, of Harrah; J. W. Stephens and W. G. Henderson, of McLeod.

The Imboden, Ark., city council at its last meeting granted a 50 years telephone franchise to M. H. Long.

Government Pays Smallest Price for 'Phone Service.

As a result of the investigation into the Government telephone service in Washington, made by Secretary Morton at the instance of President Roosevelt, a new contract has been made, which will amount in a saving on the business for the fiscal year of 1905-6 of $17,635.

Secretary Morton in reporting to the President on the result of the negotiations for a new contract for departmental telephone service in Washington, states that the rate given the Government in Washington, "is the lowest telephone rate in existence in any large city in the United States."

A reduction in the rental of stations in private branch exchanges from $12 to $6 a year is announced, and a reduction in the message rate from 3 cents to 2½ cents has been secured. Considerable economies have been accomplished in wire rental.

The total amount it is expected the Government will pay to the company during the coming year is $47,562.

Independent Telephone Deal.

An important deal in the Independent telephone situation in Northwestern Iowa has lately been concluded, which involves the absorption of all the toll lines, rural lines and local exchanges belonging to the Monona Telephone Company of Onawa by the New State Telephone Company of Sioux City, a millon-dollar corporation recently formed to conduct the toll business in connection with the new automatic telephone system being installed in Sioux City, the service for which will be ready by the middle of this month. The stockholders of the Monona Telephone Company accept $60,000 worth of stock in the new State Company. Sixteen towns are on the list. The new State Company now owns all of the Independent telephone lines and local exchanges within a radius of 50 miles of Sioux City, including 15,000 'phones in all. Copper trunk lines are being built to Le Mars, Correctionville, Sioux Falls, Yankton and Fremont, Neb.

The Lake Champlain Telephone & Telegraph Company was recently incorporated with the Secretary of State to operate lines from Eagle Bridge through Rensselaer, Washington and Essex Counties in New York, and Bennington, Rutland and Addison Counties in Vermont. The capital stock is $250,000, and the directors named are Henry E. Hawley, of Albany; J. N. Keller, F. A. Houston, C. T. Keller and F. W. Story, of Boston, Mass.; O. A. Dennis, of Whitehall, and E. D. Raymond, of Fair Haven, Vt.

Some 30 'phones are now installed on the rural system between Strawberry Ridge, Jerseytown, White Hall and Exchange, Pa., and although connection is not yet established with the United system the subscribers are enabled to talk with each other over the wide territory embraced by the above-named towns.

Steps looking toward the extension of the telephone system to include the towns of Tracyton, Silverdale, Wash., and terminating at Brown's Bay, are being contemplated. Negotiations are in progress with Manager W. D. Colder, of the Peninsular Telephone Company.

Syndicate Buys Telephone Company.

A syndicate formed by the Mississippi Valley Trust Company has purchased the Suburban Telephone Company, operating in St. Louis County, Mo., within a radius of five miles from Clayton. The lines will be increased to include all of St. Louis County. The intention of the new controlling interests are to increase the capital stock from $100,000 to $500,000,

The price paid for the stock of the Suburban Company has not been made public. A working agreement is planned to be made between the new company, which will be Independent, and the Kinloch Telephone Company.

James Houseman, original promoter of the Suburban Company, and a principal stockholder, closed the deal for the sale. Stockholders from the Suburban and Kinloch companies are included among those interested.

Consolidated Company Increases Directorate.

The Consolidated Telephone Company, which recently acquired the stock of the Frontier Telephone Company, of Buffalo, N. Y., has increased its directorate by electing the following men: John Markle, Wilkes-Barre, Pa.; J. Sloat Fassett, Elmira; E. Frank Brewster. Rochester; George W. Thayer, Rochester; V. Moreau Smith, Rochester; Charles W. Goodyear, Buffalo.

Coloma, Cal., is to have a local telephone system. Business has increased to such an extent that the telephone company has seen the need of additional service. The preliminary steps have been taken and the new line, it is expected, will be in full operation in a short time.

The Highways Commission of Maryland, has granted permission to the Chesapeake & Potomac Telephone Company to build a line from White Hill to Bluemont, and from Herford to Mount Carmel. When this is done the telephone company will have extended its lines to every section of Baltimore County.

The Home Telephone Company, of San Francisco, Cal., stands ready to spend millions of dollars in constructing an up-to-date plant the moment permission is granted it for a city franchise.

The Independence, Mo., Home Telephone Company has filed notice of an increase of its capital stock from $30,000 to $60,000.

The Auglaize County, O., Telephone Company has increased its stock from $15,000 to $25,000.

Telephone Incorporations.

The German Telephone Company, Craigville, Ind. Capital stock, $10,000. Directors: John H. Barger, William H. Deihl, Alfred S. Abbott, Walter Reed and David C. Huffman.

The Automatic Telephone Manufacturing Company, Augusta, Me.—to manufacture telephones, etc. Capital stock, $200,000. President, L. J. Coleman, Gardiner; treasurer, W. S, Lee; clerk, C. L. Andrews, both of Augusta.

GENERAL ELECTRICAL NEWS.

LIGHTING.

Aledo, Ill.—Bolton Brothers have been granted a franchise to operate an electric light plant here.

Alma, Kan.—It has been reported that this city is to have an electric light plant to be installed in a few months.

Bellevue, O.—The Mutual Light & Water Company will be the name of the new company granted a franchise to light the streets of this city by electricity. Its capital stock is $50,000, and incorporators, E. C Crocker, B. F. Bell, Peter Brady, W. H. Bell and C. W. Bell.

Cairo, N. Y.—The Cairo Electric Light & Power Company, capitalized at $50,000, has been formed with the following directors: C. E. Hewitt, M. G. Hubbard, Chatham, N. J.; F. G. Walters, Cairo.

Carbon Hill, Ala.—The citizens have voted to issue bonds to put in a waterworks system and electric lights.

Center, Tex.—The electric light plant here was lately destroyed by fire.

Coalgate, I. T.—The Coalgate Electric Light & Power Company has been incorporated with a capital of $100,000.

Dayton, Ia.—The citizens have organized a light and power company, with a capital of $10,000, and will install an electric light plant.

Friar Point, Miss.—A committee composed of J. H. McClelland and O. G. Johnston, was lately appointed to correspond with sundry firms to ascertain the cost of installing an electric light plant in this town.

Galva, Ill.—This town will issue $5,000 in bonds to build a new police station and extend the electric light service.

Kennewick, Wash.—C. R. Wood, of Genesee, has asked for a franchise for an electric light and water system for this city.

Kingsley, Mich.—Business men of this village are considering a plan whereby they can secure electric lighting for the business places and streets of this village. It is proposed that they shall install poles and lamps, and the Boardman River Electric Light & Power Company furnish the current from its plant.

Little Falls, N. Y.—At a recent special meeting of the common council, the matter of the street lighting contract was taken up. Attorney Rush F. Lewis asked that a franchise be given the Hudson River Electric Power Company to operate in this city. The matter was placed in the hands of a committee with full power to investigate and appear at a subsequent meeting of the board. The committee consists of Mayor Douglas, Aldermen Staus, Dettinger, Livingston, Ash, Walrath and Jennings.

Quincy, Ill.—At the annual meeting of the Quincy Gas & Electric Company it was voted to increase the capital of the company from $600,000 to $2,000,000. The officers are K. I. Lynn, president; M G. Borgmah, treasurer.

Scottsbluff, Neb.—Charles Johnson, of Iron Mountain, Mont., says he will put in an electric light plant either here or in Gering if he can get enough renters to sign a contract promising not to rent of any other person or party for at least five years.

Snohomish, Wash.—The Snohomish electric light plant was totally destroyed by fire, entailing a loss of $10,000.

South St. Paul, Minn.—The South St. Paul Electric Light, Heat & Power Company has filed articles of incorporation with a capital of $50,000. The incorporators are Michael O'Toole, Emil Gardie and others.

St. Augustine, Fla.—The city council has accepted a bond for $5,000, furnished by T. R. Osmond and W. D. Barnett, as a guarantee for the construction of an electric light plant and street railway.

Tecumseh, Neb.—This city will increase the capacity of its electric light plant.

Temple, Tex.—O. W. Jones, of Oscar, located seven miles east of this place, has been here making arrangements for installing an electric light and telephone plant at Rogers, 15 miles south of this place on the Santa Fe. Mr. Jones and his associates will build an up-to-date electric light plant. They will likewise build a first-class telephone exchange and furnish local service not only to the town of Rogers, but to a large section of fertile farming country extending around it.

Van Horn, Ia.—A new electric light plant will soon be installed here with 1,000 lights capacity. O. H. Hartung and John Holler are at the head of the enterprise.

Webb City, Mo.—The Southwest Missouri Electric Light Company has asked the city council to grant a franchise for it to furnish this city and its citizens with lights and power.

Winfield, Kan.—An electric lighting plant, to cost $45,000, will be installed here soon.

STREET RAILWAYS.

Barberton, O.—The Barberton, Wadsworth & Western Traction Company was lately granted a franchise for 25 years to operate its line over three of the county roads.

Carlisle, Pa.—It is said on reliable authority that the Dillsburg branch of the Cumberland Valley Railroad, running from Mechanicsburg to Dillsburg, will soon be operated by electricity, making hourly communication to Harrisburg by connection with the Valley Traction cars at Trindle Springs.

Indianapolis, Ind.—A company of Dayton, O., electric road builders and financiers have been making arrangements for the building of an electric road from the army post to the end of the College avenue city line.

Jacksonville, Fla.—W. A. Riddle and J. D. Lawrence, of Philadelphia, will build an electric railroad from this city to St. Augustine.

Lansing, Mich.—The Lansing City Electric Railway Company, through a communication from Superintendent James R. Elliott, has accepted the franchise granted it by the council.

Marietta, O.—The work of taking up rights of way for the extension of the electric line from Devol's Dam to Lowell will begin at once.

Millville, W. Va.—The Winchester & Washington City Electric Railway Company of Winchester, Va., has purchased a site here upon which a large power house will be erected.

Newport, Ky.—A traction line to connect the localities of Brent, Phoenix Grove, Glen Park, Melbourne and Ross, and give rapid transit communication with this city, is being agitated by the residents of the places named.

North Yakima, Wash.—This city is to have an electric railway system to tap the valleys that are tributary to it.

Riverhead, N. Y.—The officers of the Pennsylvania Railroad, operating the Long Island Railroad system, are said to be considering the construction of a new trolley line running from Wading River to Mattituck, a distance of 18 miles. The proposed route has been surveyed. The line would run through the northern part of this village and parallel Long Island Sound for several miles, connecting the Wading River branch of the railroad with the main line.

Schenectady, N. Y.—Extensions of the trolley lines will be built in this city.

POWER PLANTS.

Charleston, S. C.—Plans are said to have been nearly perfected for the development of the water power at the Great Falls on the Catawba River, near Chester and Winnsboro. The promoters of the project have secured possession of the properties on the river at that point for a distance of eight miles, in which there is a fall of 173 feet. This power will be developed in units one-third its total capacity. Each unit will give from 25,000 to 30,000 hp. The main line from this point will transmit the current at 44,000 volts.

Galion, O.—The Crawford Gas & Electric Company, recently organized by local and Eastern capital, is preparing to erect an up-to-date electric power house to cost about $75,000 to furnish electric power for manufacturing and other purposes in this city. The company will also furnish light and power to all neighboring cities with which it can secure contracts, the service to be furnished from the plant in this city.

Housatonic, Mass.—To develop 1,000 hp. on the Housatonic River in Glendale and Stockbridge, the Monument Mills Company, of this place, will spend $100,000. A dam 200 feet long and 25 feet high will be built, and half a mile below will be a power house.

New York City.—The Kings County Electric Light & Power Company is to double its total authorized capital stock. To this end a special meeting of the stockholders has been called for July 10 to vote on a proposition to increase the capital of the company by $5,000,0000 to $10,000,000. W. W. Freeman has been elected vice-president and general manager in place of the late E. A Leslie.

BIDS WANTED.

Astoria, Ore.—Captain Goodale, Constructing Quartermaster, United States Army, of this place, will receive bids for electric light fixtures, and for the installation of an exterior and interior lighting system at Fort Stevens.

Omaha, Neb.—Sealed proposals in triplicate will be received for an electric lighting system at Fort Crook. Address Major M. Gray Zalinski, Constructing Quartermaster, Army Building, Omaha, Neb.

Washington, D. C.—Sealed proposals will be received until July 18 by C. F. Larabee, acting commissioner of Indian Affairs, this city, for furnishing electric light and constructing an electric lighting system at the new school near Wahpeton, N. D.

NOTES FOR INVESTORS.

Latest quotations for copper are: Electrolytic, 15@15⅛c.; Lake 15@15¼c.; casting, 14¾@14⅞c.

A dividend of 1¾ per cent. will be paid on the stock of the Consolidated Traction Company of New Jersey on July 15.

The Independent Telephone Company of Syracuse, capital $1,000,000, has been incorporated to operate in 16 counties of central New York.

The Omaha Electric Power Company has declared a dividend of $2.50 per share, payable August 1 to stock of record July 20.

The adjourned special meeting of the Mexican Telephone Company at the Astor House, New York, was again adjourned to July 19 at 10:30 A. M.

The Kings County (Brooklyn) Electric Light & Power Company stockholders meet July 10 to vote on a proposition to increase the capital from $5,000,000 to $10,000,000.

The New York & New Jersey Telephone Company has declared the regular quarterly dividend of 1½ per cent., payable July 15 to stock of record July 5.

The latest earnings of the Philadelphia Rapid Transit Company show that it closed the fiscal year, ending June 30, with an increase in net earnings over 1904 of about $270,000.

Plans for an immense holding company, which will take over all the electric traction lines centering in Indianapolis, Ind., are being made by the Widener-Elkins Syndicate of Philadelphia.

A schedule has been filed with the referee in bankruptcy showing the liabilities of the National Electric Company of Milwaukee, Wis., to be $1,259,671; assets, $3,500,000. Of the liabilities, $1,120,000 is secured.

There has been placed on record at Newark, N. J., a mortgage for $3,000,000 from the Morris County Traction Company to the Trust Company of America of New York, as security for an issue of bonds to be used in extending the lines of the Traction Company in Morris and Union Counties, N. J.

The General Transmission Company of Buffalo, N. Y., recently filed a mortgage of $15,000,000 on its property to the Buffalo Loan, Trust & Safe Deposit Company. The object of the mortgage is to enable the company to issue bonds. The company operates an electric system and gets its power from Niagara.

The reorganization committee has recommended a sale of the Eastern Ohio Traction Company's property under foreclosure of the consolidated mortgage, and the organization of the Cleveland and Mahoning Valley Traction Company to take over the properties, to manage which the Eastern Ohio was organized in 1902. The proposition is to issue $2,000,000 common, $1,000,000 preferred, and $2,500,000 new first consolidated mortgage 5 per cent. bonds. The new company will need $878,000 for various purposes.

The National City Bank of New York and N. W. Harris & Co. have jointly purchased direct from the company, and are offering to investors, $3,250,000 of first mortgage 5 per cent. gold bonds, due December 1, 1948, of the New York Gas and Electric Light, Heat & Power Company. With the purchase of these bonds the entire issue of $15,000,000 is now outstanding. The New York Gas and Electric Light, Heat & Power Company was consolidated with the Edison Electric Illuminating Company in 1901, thus forming the New York Edison Company, practically the entire capital stock of which is owned by the Consolidated Gas Company of New York.

EDITORIAL NOTES.

What Electricity is Doing for Long Island.

The artificiality of city life must give way periodically to the imperative demands for fresh air and freedom. Recuperation is so great a necessity that a denial of this requirement leads to physical bankruptcy. In certain respects, Long Island has been the camping ground for tired and anaemic citizens for many seasons. It is endowed by nature with many advantages that have led to its exploitation as a place for winter and summer homes; but a most valid objection was raised and has been raised for many years by prospective settlers. The transportation facilities were regarded as part and parcel of a system touching upon the archaic. Condemnation, however varied and profuse, led to but temporary improvements. Long Island, for these and other reasons of a secondary nature, developed in a sluggish and unsatisfactory manner. Its enormous stretches of snow-white sand remained deserted. Even if such spots were accessible, the fare was prohibitive to those with whom economy was dictated by necessity. This is the situation to-day, at a time which might be practically regarded as the dawn of a new era in the history of Long Island. This new era was inaugurated in 1905 by the laying of a third-rail and the bonding of tracks to certain crowded sections of this island of summer homes. It has rarely happened that the introduction of electricity for such purposes has failed in its accomplishment. It means the thin edge of the wedge, the beginning of great changes in transportation facilities. Electricity is making Long Island a near-by suburb of New York. This not only means civic stimulation of the healthiest character, but it supplies an outlet on the east for the population of a city whose only line of expansion hitherto was northward. It brings health resorts within a reasonable time of New York, and under such circumstances by increased traffic will probably lead to a reduction in rates. Now that progress is the watchword, the electrification of Long Island will represent one of the most interesting phases of third-rail traction in the United States. It is one of the most substantial methods possible of opening up a territory suitable in every respect to the peculiar needs of Greater New York from the double standpoint of expansion and hygiene.

The Bronx is getting its subways, and already possesses elevated roads and surface cars. These are remedies which quickly alleviate certain of our city complaints. A little touch of the same medicine would rapidly transform Long Island into the scene of growth and improvements second to none in the entire country.

* * *

China and Our Electrical Industries.

If the spirit of change is causing a national ferment in China, as it did in Japan, then the opportunities for commercial and industrial development there are far greater than anywhere else in the world. The population of this comparatively untouched corner of the globe exceeds 500,000,000 people; and it is merely necessary to glance over the possible needs of this enormous community—when awakened to the same conditions of activity as Japan—to see what may be done along the lines indicated. Exclusiveness has never led to greatness in a national sense, and it may be stated now, with much of truth, that the leaven of change is disturbing the inner and more conservative circles of Chinese life as never before.

The rapid decay of Russian assumptiveness before the mailed hand of Japan hes moved this national anachronism to accept a broader view of Western civilization, if for no other reason, for that at least, of emulating her neighbor's example in acquiring to some degree, a knowledge of our arts and sciences. China is nothing more nor less than an overgrown nation, which will in the course of time become more and more susceptible to Western influence. This influence is bound to grow, and will, in the natural course of events, lead to a rehabilitation of her policy in internal as well as external affairs. The potentiality of this great aggregation of human beings, with their multifarious needs, has struck the average American with great force. The awakening of China means an industrial activity in this country which will be beyond easy measure.

Electrical equipments, such as those required for electric lighting, power and street railway service will be in the greatest demand. It might be said that England is on the ground now and will control the trade. The answer to this will be found in the following incident: When England advertised for bids for electric elevators for her subways, the contract was obtained by Americans because of their lower price and quicker delivery. The same has been true in connection with contracts in Soudan for steel bridges or in South Africa for railway equipments. China must call for these supplies and outfits and none can deliver them with the same celerity as ourselves. For this reason, the future prospects of radicalism in China are in many respects the future prospects of increased trade in this country. In spite of the Dowager Queen the growth of a definite public opinion in China is increasing. Newspapers of a reform character are beginning to circulate widely, and there is every reason to believe that the inner heart of Chinese conservatism will soon be pierced. So auspicious an event as this will be best recognized by a flood of orders from the Celestial Kingdom. Americans have a matter calling for their most careful consideration in dealing with this new problem in our international relations. They want China's trade, but some of our California friends don't want her people. It looks as though the near future will soon decide as to whether we will have both or none.

◆

The contract for the construction of the United Engineering Building on west 39th street has been awarded to Wells Brothers' Company of this city for $795,000. This does not include any allowance for steam heating plant, electric wiring, etc. The ground is already excavated and work will begin at once. It is expected that the edifice will be completed by October, 1906.

◆

UNDER THE SEARCHLIGHT.

Notes and Comments on Various Topics.

The prominent peak, Eismeer, on the Jungfrau railway in Switzerland, which is destined to rank as the highest railway station in the world, has just been reached by the successful piercing of a tunnel on the new line 1,500 yards in length. The Eismeer station is 13,400 feet above the sea, and 100 feet above the magnificent glaciers on the south of Mont Eiger. The station will be open for traffic in August and will make an incomparable starting point for glacier excursions and ascents.

◆

The North-Eastern Railway Company of England has adopted on a short stretch of road the "Hall" signaling system. In this system carbonic acid gas is made use of. The gas is contained in a cylinder at a pressure of 600 pounds to the square inch (reduced to 500 pounds working pressure), and the valves for admitting the air to the operating cylinder are electrically controlled.

◆

According to statistics during 1904, Great Britain sent $222,485 worth of electric apparatus and machinery to Egypt as against $25,855 imported from the United States. Our electric exporters should improve upon this.

◆

One of the most severe storms of the year swept over Greater New York last Monday afternoon. In ten minutes 1.2 inches of rain fell. Lightning and wind accompanying the storm played havoc in many places.

◆

Mayor Dunne has informed the Chicago City Council of his plans for municipal ownership of traction properties. It was not municipal ownership exactly, either, but, as the Mayor explained, the nearest thing possible under existing conditions, and he asked the aldermen to consider it carefully. Absolute municipal ownership and operation, the Mayor said, he does not consider practical just now. The plan which the Mayor offered in the first message he sent to the council since his inauguration provides for "the incorporation of a company, managed by five men who command the confidence of the people of Chicago, for their personal integrity, their business ability and their pronounced sympathy with the policy of municipal ownership. To this company is to be granted a 20-year franchise covering the streets in which the rights of the old companies already have expired, or will soon expire. It is to be stocked to the amount necessary to establish a street car system in these streets roughly estimated at 240 miles. No bonds are to be sold. The stock is to be deposited with a trust company which the five directors are to select so as to prevent a purchase of it and consequent control by outside interests."

◆

The necessary license has been granted by the Government of India to the Brush Electrical Engineering Company to supply electricity to the town and island of Bombay for lighting and power purposes. Two years are allowed for the laying down of cables in the principal portions of the city. The company has proceeded with the installation of the plant, while the Government has been considering the question, and during the past year several miles of cable have been laid down, and a generating station erected.

◆

High-speed trials with steam locomotives on the military railway between Marienfelde and Zossen in Germany, have been continued during the past few months with a 2.4 coupled express engine, superheated on the Schmidt system, and weighing, all told, 85 tons, of which 35 tons represent the four-axled tender. Coupled to three corridor cars, the engine covered the measured course at a mean rate of 84½ miles an hour, and drawing twice that number of cars at the rate of 80 miles per hour. The superheated steam locomotive employed on the Government railway lines has developed a speed of about 62½ miles an hour. The trials have shown that this type of engine is more powerful than the usual type of express locomotive, in that it can cover greater distances without changing, and is more economical in coal and water consumption.

◆

The Brooklyn Rapid Transit Company is about to introduce an elevated school car for the instruction of elevated trainmen. The car has been specially built for the purpose. It is 50 feet in length and has end vestibules, and sliding doors at each end with a pneumatic buffer, the doors being controlled by air. The car is thoroughly equipped with all sorts of electrical devices and is up-to-date in every particular. The interior is fitted up with sectional apparatus and a full train of six cars is shown in the motor equipment and air brake appliances. Both the drum type and switch group type of control are shown as well as the manner in which automatic couplings are made. This car will be in operation on or about the first of the coming month.

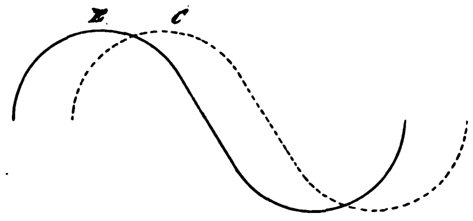
◆

ELECTRICITY LEAFLETS.

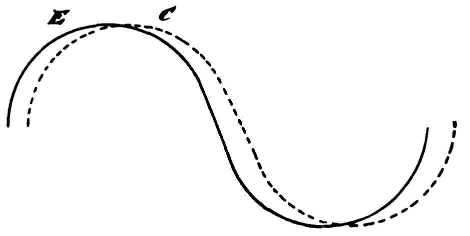
BY NEWTON HARRISON, E. E.

The Transmission of Power.

Effects of Frequency.—The effect of high or low frequency upon the capacity of a line to conduct a given amount of energy has led to the adoption of as low a frequency as is consistent with a continuity of flow. It is also evident that the question of resistance is secondary in circuits carrying a current of high frequency. The inductive resistance is the limiting influence in all cases where a high frequency is employed. The frequency is generally from 50 to 120 cycles per second in electric lighting. The effect of increasing the frequency is to make the copper conductor become inoperative. The cross-section of the conductor is not permeated by the electrical energy. It passes along the outer surface more and more as the frequency is increased, until at very high frequencies a thick copper bar becomes absolutely non-conductive to that particular form of energy Low frequencies in power transmission plants are necessary features if conductivity and efficiency are important considerations. The effects of the static capacity of the line and its inductance increase with the frequency. The sketch shows how the current and pressure become separated by the effects of induction and frequency. The development of a form of energy which is ineffective or *wattless* is readily discovered when the above conditions are exaggerated.

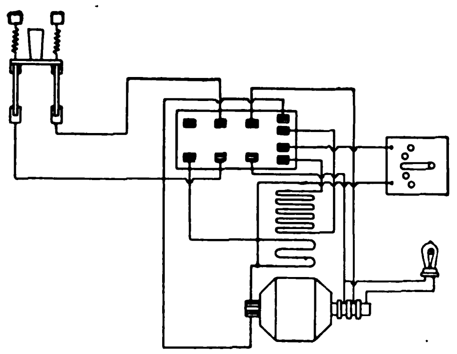


Effects of high frequency and induction separating C and E.



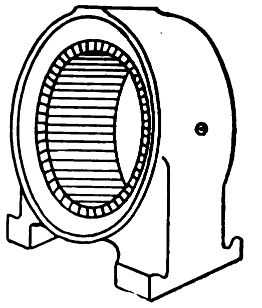
Low frequency, causing a better co-operation of C and E.

The Synchronous and Induction Motor.—The alternating current in its simple form, single-phase, as it is called, will not start an alternator to be used as a motor, from a condition of rest, unless it possesses the same number of poles and is speeded up until it is in step with the alternator. The motor and alternator are then said to be in synchronism but, as has been stated, to rise to synchronism, the alternator serving as a motor must be speeded up. Devices have been employed to serve this purpose, consisting of either means to split the phase and thus develop temporarily the effects of a two-phase current, or to use a commutator and series winding on the armature and field respectively. In this latter case, the alternating current serves to operate a series motor through the medium of the commutator and winding; then, when the requisite speed is secured the alternator is employed entirely as a synchronous motor.

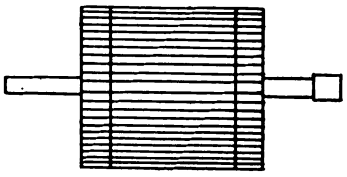


Synchronous motor, made to be self-starting by commutator and series field winding.

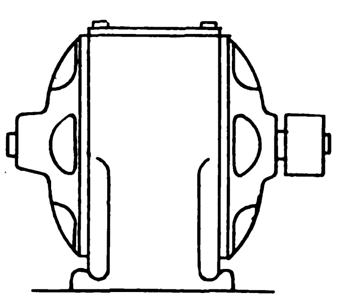
The induction motor operated by a two or three-phase current, is self-starting. It consists of a field so constructed that the two or three-phase current creates within it all the effects of a rotating wave of magnetism. A laminated iron armature, around whose periphery are set copper bars parallel to the shaft, will start itself from a condition of rest when exposed to the influence of the rotating field. The series wound motor has recently risen to prominence as serviceable for railroad purposes in connection with single-phase alternating currents. Their construction on a large scale will have a great influence on power transmission plants in that they remove the necessity for the conversion of the power into a direct current. It can be transformed down to a pressure suitable for railroad service and need not be generated as other than a single-phase current. Experiments performed in this direction give great promise of future usefulness. The series wound motor employed for this purpose is constructed in all essentials like a direct current machine but particular attention is paid to the induction. This is regulated by the design to meet the conditions of practice.



PRIMARY READY FOR WINDING



SECONDARY COMPLETE



MOTOR COMPLETE

Induction motor, showing primary ready for winding, rotor or secondary, and the machine assembled.

Effects of Inductance.—The general effects of inductance are such that impedance is manifested primarily, the consequences of which are a limitation in capacity of the circuit for the conveyance of power. The idea is well exemplified in the case of a choke coil connected to a lighting circuit. The choking effect becomes more and more magnified as the inductance in the coil is allowed to increase. The increase in induction causes a greater and greater separation between the two elements power, namely, the volts and amperes. The diminution in power as this difference is augmented, brings clearly to view the meaning of the power percentage factor or power factor. The apparent power and the available power, when compared as a ratio, show the contraction of the line electrically. In great power lines this fact is a controlling influence in their calculation and operation. Frequency and inductance may be considered as the modifying elements in power transmission by alternating currents.

Varying the Power Factor.—The variation of this factor is shown by changes in the relationship between the EMF. and current. These variations are due to the difference in phase between one and the other. If it is supposed that the EMF. and current represent the sides of an angle; then the more nearly the sides coincide, the less is the difference between the apparent and real power available The more widely they diverge, the less actual available energy is at hand. The angle is called φ according to the general notation and in a mathematical way the expression reads—the watts are equal to $E \times C \cos \varphi$, where the relationship between E and C as affected by the frequency, capacity and induction is shown by the cosine of the angle.

The Wattmeter.—The power measurement cannot be made by an alternating ammeter and voltmeter for the obvious reason that these instruments take no cognizance of the difference of phase. The wattmeter, however, is contrived to meet this requirement and gives readings of the true watts. The diagram showing how this purpose is attained is given in the following sketch. There is shown a movable coil and a fixed coil. The movable coil is placed as a shunt across the terminals when the meter is used. It has in series with it a non-inductive resistance. The fixed coil is placed in series with the circuit. Under these conditions the instrument has two currents operating in such a manner that the force required to hold the movable circuit with its axis at right angle to that of the fixed coil, will be proportional to the product of the mean value of the currents respectively. In other words, the wattmeter gives the net result of the power in the circuit. The conditions of success, as given by Prof. J. A. Fleming for the operation of a wattmeter, are covered by the following statement: "The current through the series coil of the instrument must have the same value as the current through the circuit to be measured, and the current through the shunt coil of the wattmeter must be exactly in step with the difference of potential between the ends of that shunt circuit; in other words, the shunt circuit must be strictly non-inductive. This can only be secured by winding the movable coil of the wattmeter with no very large number of turns. It is convenient to call the product of root—mean—square value of the amperes and the root—mean—square value of the volts, the *apparent* watts taken up by the circuit, and to call the true mean value of the power as read by the wattmeter the *true watts* taken up by the circuit."

14	.970	30	.866	46	.695	62	.469	78	.208		
15	.966	31	.857	47	.682	63	.454	79	.191		

Reduction of Watts With Greater Angle.—To show a simple case or two of the influence of lag on the part of the current, take an instance of 100 volts and 10 amperes operating in the circuit. If there is no difference of phase, the two power components operate simultaneously and the total energy = 10 × 100 × (cos 0° = 1) = 1,000 watts. If inductance causes a lag of 10°, then the total watts = 10 × 100 × (cos 10° = .985) = 985. If the inductance causes a further increase in lag, until it reaches a value equal to 30°, the true watts are 10 × 100 × (cos 30° = .866) = 866 watts. The power factors in these cases are respectively the ratios between the true watts and apparent watts or 1,000 ÷ 1,000, 985 ÷ 1,000 and 866 ÷ 1,000. The figures are therefore 1.00, .985 and .866 in all. The power apparent with ammeter and voltmeter would be 1,000 watts, because of no attention being paid to the angle of lag.

Alternating Current Rotaries for Polyphase Circuits.—The transmission of electrical energy over great distances, has developed with the increasing perfection and adaptability of the rotary converter. A power station, situated at a distant point, may by its means distribute its power with relatively great economy over an area beyond vision from its site. Certain standard voltages and frequencies are employed and embrace figures as follows: Alternations 3,000, 3,600 and 7,200 per minute corresponding to voltages of 125, 250 or 550 volts as required. The standard Westinghouse two-phase rotaries, according to their bulletin, receive at their collector rings, about .7 of the pressure given out at the commutator as a direct current. With a three-phase rotary at the collector rings, the ratio is about .6 of that given out at the commutator end. A two-phase 220 volt rotary can be so connected that with respect to the transformers supplying the power, 110 volts can be readily obtained for electric lighting on the three-wire plan. Sparking is almost entirely absent from this class of machines and changes in speed are in strict proportion to the frequency of the current from the central station. The result of variations in frequency causes "hunting" or pulsatory movement due to more rapid changes in frequency than can be responded to by the rotary.

Starting a Rotary.—If a rotary is connected directly with the supply circuit it will take a very heavy current with a very low power factor. It can be started by getting it up to speed by using a direct current and then switching in the other circuit. Another way, is to use a small induction motor to raise the speed. Tabulating the results gives the following.:

First—Starting a rotary by connecting to the alternationg current circuit.

Second—Starting a rotary by connecting to the direct current circuit.

Third—Starting a rotary by driving with an induction motor.

Rotaries may be employed for delivering an alternating current instead of a direct. They receive direct and give out alternating for special purposes. Standard sizes are constructed for frequencies of 25, 30 and 60 cycles, equal to 3,000, 3,600 and 7,200 alternations per minute. The voltages preserved in practice, as shown in stations are 250 and 550 volts.

◆

HEATING BY ELECTRICITY.*

BY H. ALLEN.

In the arts and crafts there are an exceedingly large number of processes in which the application of a high temperature is an absolute necessity, and a still greater number of cases where high temperature would be a source of considerable utility in reducing the length of time of many operations, as well as greatly facilitating many such operations as soldering, brazing, welding, melting, etc., if a convenient method of heat development was available at a reasonable cost. So far the electric current has not yet been exploited greatly in this direction, owing to the electric arc not being a suitable and convenient method for so many special cases, while the resistance method, when coils, etc., are brought into use as a heating medium, is subject to many inherent defects.

The resistance material called "Kryptol," consisting of a patented mixture partly composed of graphite, carborundum, silicates, and clay in a granular form, can be so readily handled by any ordinary skilled operator that a few details of its applications for such purposes as boiling, melting, etc., may be of service to many readers. The most simple form of apparatus (Fig. 1) may be described as consisting of a bed of refractory material having an electrode of carbon or other material at each end, to which the electric conducting wires are connected. These electrodes are situated some distance apart, according to the size of the stone, and the only further accessory that is required is Kryptol of proper sized granules to suit the available voltage of the current. If a quantity of Kryptol is spread, say, by means of a spoon, in a layer between the two electrodes, more or less current will pass through it in proportion to the thickness and width of the layer. For simply heating liquids, melting of lead solder and any metal of low melting point, the containing vessel may be simply laid on the bed of Kryptol. There are no regulating apparatus required to adjust the temperature, as all regulation is effected by manipulating the loose granules on the bed of the stone.

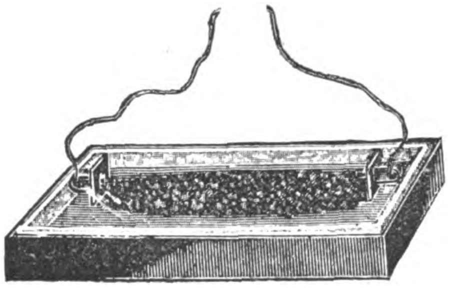

Fig. 1.

Supposing it was desired to weld two pieces of iron, in this case the pieces to be heated can be simply placed in the Kryptol, while by thinning down the layer, or making it narrower, the heat rapidly rises to any desired temperature up to about 3,600 degs. Fahrenheit. Another feature about this material is that it is made in different-sized granules to suit the voltage, the usual range being from 100 volts to 250 volts. In a simple test the writer melted a cube of copper weighing 8.45 grammes in one minute. The metal was contained in a small porcelain crucible resting upon the Kryptol, which had been brought up to the required temperature. The electric supply was at 240 volts, and 15 amperes were applied. This may not seem very economical in regard to cost of current, but a short time only is required to raise the temperature to a welding heat, and the current can be shut off immediately the required temperature has been attained. Several different forms of stones have been designed for use with this material, but the simple flat stone would be a great convenience for jewelers, dentists, chemical laboratories, etc.

The first passenger train run in the extension of the Subway under the Harlem River left Brooklyn Bridge at 2 o'clock last Thursday afternoon. It carried a party of newspaper men, General Manager Hedley and other Interborough officials.

AUTOMATIC SYNCHRONIZIN OF GENERATORS AND ROTARIES.*

BY PAUL MAC GAHAN.

The tendency in central station development is to eliminate as much as possible the personal element in operation; to introduce labor-saving devices reducing the cost of operation, and automatic apparatus of every description to minimize the amount of attendance required, so as to prevent errors and accidents, and to insure continuous operation.

The synchronizing of generators or rotaries has been the stumbling block in most installations; for a good many years the incandescent lamp method was the only one successfully employed to indicate when the machines were ready to couple. If the lamps were connected across the main switch to similar phases the voltage across their terminals would be a minimum when the machines were in phase, and a maximum when in opposition, thus indicating by their dark period the proper instant for throwing the switch in, and by their flickering or pulsation the amount the incoming machine differed in frequency from the 'bus bars. When the lamps were cross-connected they would indicate the proper instant when at their maximum brilliancy. Much was left to the judgment of the operator, for the lamp did not indicate whether the incoming machine was too fast or too slow, the illumination was a function of the voltage as well as the phase, and moreover, the darkness of the lamps embraced a very large angle of phase difference. It was necessary to estimate half the time of the dark period, and this was difficult to do, as incandescent lamps have a period of their own, requiring an appreciable time to heat up and cool off. Many will remember the time, and the careful, patient manipulation required to synchronize by means of lamps.

The first improvement in methods of synchronizing was the introduction of the "synchroscope," an instrument that rotated a pointer in synchronism with the difference in speeds of the machines; this instrument has the widest general application to-day, for it gives perfect indications of the phase relation between the machines at any instant, and whether the machine coming in is too slow or too fast. It does not, however, make an allowance for the time required to close the coupling switch.

The electrically-operated switches generally used for high-tension work, and sometimes even for low-tension work, require a certain definite time to close after the closing current is established. This time varies for different kinds of switches, and the operator has to make an allowance for it in synchronizing and must close the tripping contact in advance of the actual instant of coincidence of phase, to connect the machines in a safe and satisfactory manner. Moreover, he has to take into consideration the speed at which the synchroscope pointer is approaching the zero point, and make a greater angular allowance on the dial, when the speed is greater. He has to judge what difference in speed gives a safe coupling, and, as a usual rule, will wait until he gets the pointer practically stationary before throwing the switch in. Given a variable speed, or sudden surges in the power in addition to the above variable elements, the operator has to contend with a combination of circumstances that prevent the synchronization being made quickly and which require a man of judgment to control properly.

---

*From the "Electrical Engineer," London.

*Paper read before the National Electric Light Association at its 28th convention, held at Denver-Colorado-Springs, Col. June 6-11, 1905.

Thus it will be seen that if a device could be designed that would automatically respond to the above variables, and close the circuit at the proper instant in a safe and positive manner, the skilled operator could be dispensed with and the coupling could be done in much less time.

A successful automatic synchronizer should fulfill the following conditions:

1. It should be certain and safe in its operation.

2. It should take advantage of the first favorable opportunity for coupling.

3. It should couple the machines as soon as the difference in speeds is reduced to a safe amount.

4. It should close the contact in advance of the period of coincidence a sufficient amount for the switch to act, thus coupling the machines at the exact point of synchronism. The greater the difference in speed, the greater should be this advance in angle, in order to make the time allowed constant. As different kinds of switches require different lengths of time to close, the amount of advance should be adjustable.

5. It should prevent the coupling taking place if the speed of the incoming machine differs too much.

6. If anything in the mechanism fails, it should prevent the coupling.

7. It should not close the contact when the machines differ seriously in their voltage, even though in phase. Although a fairly wide difference in voltage is permissible in synchronizing, and will not cause as great a rush of current as a wide difference in phase or speed, it should be nevertheless guarded against. A difference in voltage of 25 per cent. may cause a serious interchange of current between the machines; a difference of phase of 15 degs. will generally cause more.

There have been many attempts in the past to devise a satisfactory automatic synchronizer, but none of them heretofore have been successful as the apparatus did not fulfill all of the conditions described.

One of the best known of the early attempts at automatic synchronizing was the Pearson synchronizer. This device consisted of two controlling magnets mounted in the same case, each magnet serving to close a contact. The two contacts were connected in series with the closing coil of an electrically-operated switch; the magnet coils being connected in parallel, and connected to the incoming machine and 'bus bars in the same manner as incandescent lamps are connected in synchronizing. One of the magnets was provided with a movable iron core, retarded in its motion by a dash-pot, thus requiring an appreciable length of time to make contact, and operated to select a wave, or "dark period" of the lamps of sufficient length to give the main switch time to act and still render coupling safe. The other magnet had a free or instantaneous action, adjusted to close its contact only when the voltage across the synchronizer coils corresponded to a coincidence of the phases. Thus, in action, the magnet with the time element would close its contact when the difference in speed was small enough and the other magnet would complete the switch-closing circuit when the machines were in exact synchronism.

It will be seen from the description that the device does not fulfill all of the conditions enumerated; it makes no allowance whatever for the length of time required by the switch to act; it is true that the quick-acting contact may be adjusted to operate at a voltage corresponding to a slight difference in phase so as to make contact ahead of time, but this would mean that it could make contact the same length of time too late. If the speed suddenly changes after the slow solenoid has closed its contact there is danger of the second contact closing. Besides, the angular advance of the contact would not vary with differences in speeds, thus coupling the machines at too early a period when they approximated in frequency, and too late when they differed considerably, for the switch requires a constant time to close. These defects alone were sufficient to cause accidents in operation, except under particularly favorable circumstances, and thus rendered the device commercially a failure. However, the inventor deserves great credit for taking the first step in automatic synchronization and pointing out the advantages that would accrue with a device that would infallibly do the work.

The latest development in automatic synchronizing is a new device perfected very recently, which seems to fulfill all the eight conditions enumerated in a highly satisfactory manner. It differs entirely in its operation from the Pearson synchronizer, which was described quite fully so as to accentuate the features necessary for a successful synchronizer as well as to throw a light on early progress. This new synchronizer consists of a pair of solenoids, each actuating a laminated iron core, supported from opposite ends of a rocker arm. Each solenoid is wound in eight separate sections, alternate sections being connected in series, thus forming two circuits in each solenoid; one circuit of each solenoid is connected in series with a circuit of the other solenoid, thus forming two independent circuits in the instrument, each circuit having half of its turns on each solenoid (see Fig. 1). One circuit is connected to a pair of binding posts deriving current from the 'bus bars and the other circuit to binding posts connected to the incoming machine. The connections of the various sections are so made that when the incoming machine is in phase with the 'bus bars, the currents in the right hand solenoid act in conjunction, thus pulling down the core, and the currents in the left-hand solenoid neutralize or cancel each other magnetically and produce no pull. On the other hand, when the machine is in opposition to the 'bus bars, the currents in the right-hand solenoid neutralize and the left-hand solenoid exerts a pull, its currents acting in conjunction.

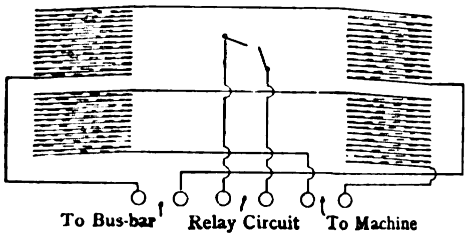

FIG. 1.
Schematic Diagram of Internal Connections.

The cores are suspended so as to reach the magnetic neutral of the coils at their extreme down stroke; thus, when the machines differ in speed, the horizontal beam rocks to and fro with a harmonic motion. As the incoming machine approaches the frequency of the 'bus bars, the motion becomes slower and finally ceases when the machines are at the same frequency. If the machines are in phase the right-hand core will stop at its lowest position, unless the voltages differ considerably when the currents will not neutralize, and the core will not be able to reach its extreme stroke. The left end of the rocker arm carries a contact spring marked a in Fig. 2, which slides along the top of a fiber segment b. This segment has a platinum strip c on the top, which in conjunction with the stationary spring d forms the contacts of the relay circuit. The springs and contact are of such length that when the segment is stationary contact can only be made when the right-hand core has reached its extreme position.

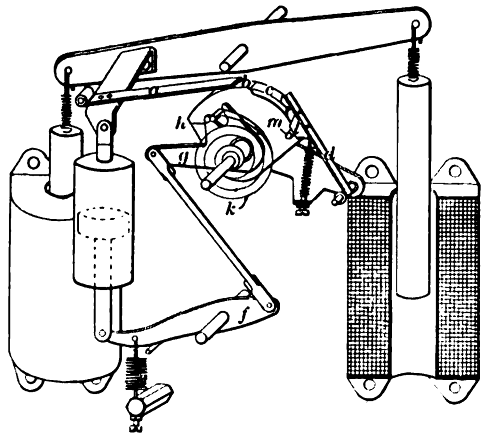

FIG. 2.
Contact Mechanism.

The vital characteristic of this instrument—the one that makes it successfully cover the requirements given for automatic synchronizing not heretofore met is the peculiar motion imparted to the contact segment. Instead of being stationary, it is pivoted on a shaft concentric with the rocker-arm shaft, which latter on its left half carries the chamber of a dash-pot, the motion of whose piston is opposed by a spiral spring in the manner shown in Fig. 2.

When the left end of the rocker arm rises, it tends to lift the piston of the dash-pot and elongate the spring e. Upon the return stroke a valve in the dash-pot opens, allowing a quick return motion.

The piston rod of the dash-pot carries an arm f, which is so attached to the contact segment as to shift the latter to the left, thus advancing the position of the contact when the rocker arm moves up with a sufficient speed to draw up the dash-pot piston. The slower the motion of the rocker arm, the less the piston of the dash-pot is raised, and consequently, the less the contact segment is advanced.

It will be noted from Fig. 2 that the arm f does not act directly on the segment, but operates a brass fork g between the prongs of which is a pin h, which is screwed into the contact segment. There is a spiral spring k between the contact segment and the fork which tends to keep the pin against the right prong of the fork. The pin has thus about one-eighth of an inch of play, the purpose of which will be apparent later.

Turning our attention to the right-hand, or stationary, contact spring, it is seen in Fig. 2 that this spring carries a cam l, the inclined edge of which is met by the pin m upon the return stroke of the contact segment. This stationary contact spring is of such strength that the pin m can not raise the inclined edge of the cam, for the contact segment is being actuated through the weaker spring k. Thus, upon its return stroke, the contact segment is delayed for an instant until the left prong of the fork g, touches the pin h and thus forces up the cam. As soon as the pin m reaches the end of the inclined plane the contact segment is free and is snapped over by the spring k. The purpose of this action will be apparent later. It will be noticed in Fig. 2 that the position of the stationary or right-hand contact spring can be varied. This, in conjunction with the adjustment of the spring e, is for the purpose of adjusting the difference in speed of the incoming machine at which the synchronizer will couple. Thus, when the difference in speed is too great to allow safe coupling, the dash-pot piston will advance the contact segment sufficiently to drop the stationary spring away from the contact plate and down upon the insulated portion of the contact segment, thus preventing the contact from being closed when the right-hand core comes down. The retarded motion of the contact segment prevents contact being made as the right hand core rises allowing time for the left contact spring a to get out of the way.

The foregoing descriptions of the actions of the various parts may seem very complicated, but it must be remembered that the instrument has a very complex function to perform. Indeed, an observer of its action in actual service said that it acted in a manner almost human. It is, in fact, more reliable, quicker, and couples the machines with less surge of current than can be done by the most skillful operator, Considering this fact, it seems surprising that the proper action can be obtained with such a small number of parts. To better understand the operation let us follow it in the act of synchronizing.

As the voltage of the incoming machine builds up and it approaches the approximate frequency of the 'bus bars, the rocker arm oscillates violently, the dash-pot piston advancing the contact segment so far that no contact is possible, no contact being possible on the return stroke. As the speed of the incoming machine increases, the rocking becomes slower and the dash-pot piston advances the contact segment less, until finally the right contact spring no longer drops away from the contact, and as the right-hand core descends the left-hand contact spring advances to meet the contact, thus energizing the auxiliary relay in Fig. 3, which operates the switch-closing circuit just sufficiently ahead of the point of coincidence of the phases, so that actual coupling takes place at the exact instant of synchronizm. If the machine approaches the point of synchronism more slowly there is less advance of the contact segment, and the actual time allowed for the switch to act is the same as before. In the extreme condition, when the machine is coming in very slowly, there is no appreciable advance of the contact segment, the dash-pot having time to exhaust. The amount of the advance of the segment can be adjusted to suit switches having different times of closing by varying the tension of the spring E. As pointed out before, the cores cannot attain their extreme position and therefore the contacts cannot be closed if the voltage is too far out for safe coupling.

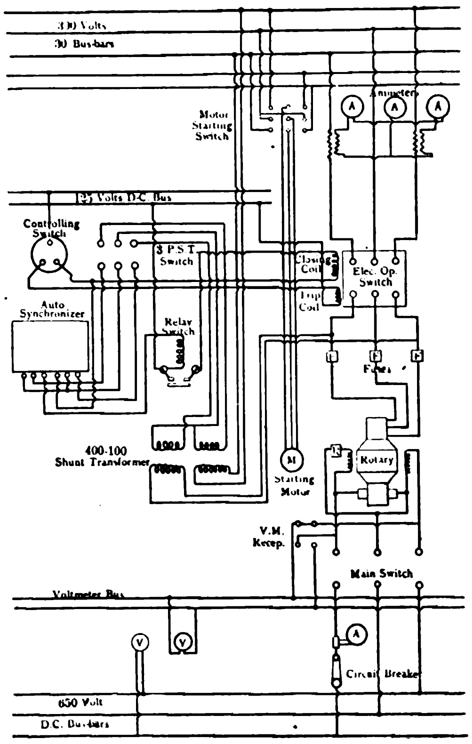

FIG. 3.
Diagram of Connections of a Rotary Converter Equipped with an Automatic Synchronizer.

The auxiliary relay takes very little energy, so there is not enough sparking on the platinum contacts of the synchronizer to burn them.

Fig. 3 is a complete wiring diagram of a rotary transformer equipped with the automatic synchronizer; by means of proper synchronizing plugs such as are used for either the lamp method or the indicating synchroscope one automatic synchronizer can take care of any number of machines.

A controlling switch, such as used with oil circuit-breakers, is interposed in circuit with the synchronizer and electrically-operated switch. By means of the controlling switch, the main or electrically-operated switch or oil circuit-breaker may be tripped but cannot be closed, as the closing coil is normally out of circuit until the synchronizer completes the contact.

An automatic synchronizer would be particularly desirable in the operation of large electric railway systems. When accidents occur which entirely shut down one or all substations, it is exceedingly important to be able to start up with the least possible delay, and there has been considerable discussion lately as to the best means of starting up the rotaries. If they are started directly from the alternating current side, a small number only can be started at once, otherwise there will be too much inductive load on the generating station. This method, therefore, requires considerable time. Starting from the direct-current side presupposes the presence of direct current power and necessitates a preliminary adjustment of the rheostats. However, if alternating current starting motors are used and an automatic synchronizer is installed for each rotary in order to start the substations it would only be necessary to throw in all the starting motors as quickly as possible and leave the rest to the automatic synchronizers, no furthur attention being necessary.

The first of these synchronizers has been in actual operation at the main station of the Pittsburg, McKeesport and Connellsville Street Railway for several months successfully and there are others in successful operation at the sub-stations of the New York Edison Company, the Manhattan Elevated Railway Company and the Brooklyn Rapid Transit Company.

They are thus no longer an experimental device, but an assured success, and a great advance in the handling of alternating current generators and rotaries.

It is reported from England that the Board of Trade has concluded a contract with Marconi's Wireless Telegraph Company providing for the installation of the Marconi system in lightships. The arrangement is expected to materially facilitate communication with the shore and between different lightships for the ordinary purposes of the lightship service, and also to report ships in distress.

CAN A STEAM TURBINE BE STARTED QUICKER THAN A RECIPROCATING ENGINE?[*]

BY A. S. MANN.

If a large steam turbine is cold and at rest, how quickly can it be started? Can it be brought up to speed as readily as can a good cross-compound engine that is cold all over?

Most station men would have doubts as to the adaptability of the large turbine, say 1,500 kw., or 2,250 hp., for emergency work. So much has been written about the sensitiveness of a rotating disk to the changes of temperature and the effects of unequal expansion, that it is easy to imagine difficulties in the rapid start. The possibilities of an engine with a 62 inch low-pressure cylinder in starting practically cold and coming up to synchronous speed are well understood. A station manager would criticise an engineer who would open his throttle as fast as he dared without wrecking his piping system and let his machine jump into her work. One turn at a time on the throttle is about all that is considered safe, and even then a close watch is kept for groaning valves and cold back bonnets.

Every time the starting valve is moved to increase the steam flow, the engine is allowed to take its full increment of speed due to that particular throttle position, before the supply valve is moved a second time. There are 10 large oil cups, and frequently more that must be opened and adjusted before the machine moves at all, beside whatever oiling is to be done about the air pumps and other auxiliary apparatus.

Most engineers would consider 10 minutes as rather a fast start and 15 minutes as a more usual starting period, including time taken for warming up; in fact, it may not be overstating the case to say that if it were known that an engine-driven plant were to be called upon in emergency for power, and it were essential that the briefest possible time were to elapse between the call and the taking of the load, one or more engines would be kept in motion all the time, turning slowly and hot all over.

This question makes itself very prominent when the steam station is operated as an auxiliary to a large source of high tension power, which is itself in the construction stage and has a large overload capacity of its own to carry, supplying all sorts of apparatus that use electric power; such as railway, lighting and power circuits simultaneously.

At such a time all sorts of accidents will happen to the high-tension water-driven plant, most of them due to the necessarily temporary character of many of the electrical connections. It takes months before an intricate system of wiring can be thoroughly relied upon, for it takes months before the temporary work of construction can be replaced.

The station at present under consideration is equipped with three Curtis turbine-driven alternators, 40-cyle, 10,000 volts, each of 1,500 kw. normal capacity. During the summer months the station is operated as an auxiliary to a water-power plant, taking all sudden overloads.

A signal has been arranged, a ¾-inch whistle, so that it can be blown instantly, should the power fail. A blast of that whistle means—cut in two turbines and bring the third up to speed. The load will be heavy, and all auxiliary apparatus must be in regular operation.

Each turbine has a surface condenser, and there are three or four pumps to be started for each pair of turbines, one circulating pump, one combined hot-well and feed pump, one pressure pump for the step bearings and one dry air pump, all of which are motor driven. The exciter is driven by a steam engine, and must be started also, for it supplies current to a portion of the auxiliary apparatus.

The boiler-room has steam up at all times, supplying a system for manufacturing purposes other than power, and slow fires are kept in enough boilers to make the steam needed for the normal load. Forced loads mean forced fires. The boilers have under-feed stokers, equipped with pressure blast, and will respond quickly to a 50 per cent. excess call for steam. The operating staff for this is about equivalent to a staff for an engine-driven plant. Engineers and oilers, however, are busy about the building on construction work, installing new apparatus and taking such work as their regular occupation when the turbines are not running.

At the sound of the whistle the water-tender starts a blower on the extra row of boilers; all blast dampers are opened up and all stokers are allowed to feed at the maximum rate. Each fireman dumps his free ash and bars over his red fire.

---

[*] Paper read at the June meeting of the American Society of Mechanical Engineers.

The man in charge of the coal and ash conveyor starts the pressure pump for the step bearings, One of the turbine men starts the exciter which supplies current to the auxiliaries beside its field current; a second turbine man starts the circulating pump and then his turbine. The hot-well pump and the air pump are started by the oiler. These movements take place simultaneously. The force is organized upon the lines that obtain in a fire station; each man has his specific duty, and after performing it looks to see that there is nothing more for him to do. Only a few seconds elapse between starting the first pump and starting the first turbine.

The turbine throttle is opened as fast as an 8 inch steam valve can be opened without endangering the steam piping system. It is not considered advisable to open the throttle valve as fast as a man's strength will permit; but if nothing unusual occurs in the pipe line, sentiment does not spare the turbine.

One electrician attends to the switchboard and telephone. As soon as the machine approaches speed, the synchronizing system is cut in and the main switches are got ready. One and one-half minutes will do all the work here outlined, including the time taken in mustering the crew from various parts of the building, itself not a trivial matter.

Manipulating an engine regulator so that it shall be at a precise speed and at an exact phase relationship from some other machine not more than $\frac{1}{1500}$th part of a second removed from it, is no matter that can be hurried, and one minute is fast time on such work. But the whole thing, phasing-in and all, has been done in 2½ minutes, including full load on the turbine, which started from a standstill.

This performance has been gone through a great many times and our record book shows that out of 43 such calls, 10 starts were made in 2½ minutes, 18 in 3 minutes and 15 in 3½ minutes.

We have taken the time in a number of instances when all the auxiliaries have been in motion and is only remained to to start the turbine and phase it in on the line; the only valves to open in such cases are the throttle and one small oil valve. The two quickest starts have been made in 45 seconds and 70 seconds, respectively, including phasing in. Others range between 1 minute 10 seconds and 1½ minutes. These two quickest starts were made on a turbine which had stood for 24 hours with the throttle valve shut tight, though there was a slight leakage past the seat. After the throttle valve is off its seat it is not more than 30 seconds before the turbine is up to speed. A cross-compound reciprocating engine of the four-valve type, 2,250 hp. capacity, can be brought up to speed from a standstill in 5 minutes if it is hot all over. This 5 minutes is to be compared with the 70 seconds required for the similar turbine operation.

A reciprocating engine, which is turning over slowly with the throttle valve just off its seat, or with by-pass open and having all its oil cups open and regulated, can be brought up to speed, say 75 turns, in 2½ minutes. This can be compared with the 30 seconds necessary for bringing the turbine up under the same conditions, that is, about one-fifth the time necessary for bringing up the engine.

If the engine is cold all over and has all its oil cups shut tight, all its auxiliaries quiet, 15 minutes is called a rapid start. Starts have been made under such conditions in 12 minutes. When we start a cold turbine, we open up the valve and let her turn, and in 2 minutes we are ready to bring her up to speed, and she will be at speed in 2½ minutes, dividing the engine's time by more than four.

SIGN AND DECORATIVE LIGHTING.*

BY LA RUE VREDENBURGH.

Your reporter desires to consider the subject of Sign and Decorative Lighting from an entirely practical and matter-of-fact point of view, presenting what must be designated as more of a paper on the subject than a report embodying data obtained from member companies of the association.

The reports on this subject submitted at the conventions of 1903 and 1904 were so carefully and ably prepared, so handsomely and profusely illustrated, and altogether so artistic and exhaustive, that your present reporter despaired of being able to follow along similar lines without being hopelessly distanced by his pacemaker, and, consequently, with the entire absence of illustrations, will endeavor to deal with the subject from the standpoint of the lighting company, that soulless entity which looks at all things through commercial glasses and prizes all undertakings in exact proportion to their money-making capabilities. In other words, your reporter desires in this paper to avoid entirely the artistic and æsthetic, and to deal with the subject of sign and decorative lighting from its purely commercial side.

It is undoubtedly a safe assumption that the business world recognizes the increased drawing force of an illuminated sign over a plain one, not only on account of the additional hours of its usefulness, but also on account of the attractive efficacy of light. With this assumption granted, the central station desiring to increase the number of its sign customers has a good proportion of its work already accomplished, for there is no need of entering into an argument to establish the superiority of its commodity. The only thing necessary for the salesman to do is to convince the prospective customer that an electric sign on his place of business will add to its attractiveness sufficiently to justify the necessary outlay, and by "attractiveness" is meant power to attract and hold customers. This power to attract may consist of a variety of attributes. Some business houses attract solely by the quality of the goods offered; others by the beauty of their decorations or the artistic nature of their display; others by the convenience of their location; others by courteousness and consideration of the wants and wishes of their customers; others by their prompt delivery of goods and the reasonableness of their prices.

The chief power of such attributes is to hold customers after they have been secured. The enterprising merchant, however, is not satisfied with simply holding his own; he must be continually adding to his own or retrogression follows. Hence there is a constant and ever increasing demand for methods, the use of which will bring new trade, and here opens the limitless field of advertising with its numberless methods and inexhaustible means. It is desired here, however, to consider only the value of electric signs and decorations, and these not so much as advertising mediums as important features of a central-station demand.

There can be no question of the increasing demand for and appreciation of the electric sign. A comparison of the present appearance of the streets of any city in the country with their appearance a few years ago emphatically attests the public appreciation of electric light, not only in signs, but also in window decorations and in general illumination. One of the large lighting companies has more than trebled the number of its sign customers during the last year and a half, another has increased its sign business 33⅓ per cent. within a year, having added about 600 signs of all sizes. This company has adopted the policy of supplying and installing signs free of charge under contract, provided the customer will agree to keep the sign a certain length of time and burn it either fixed hours or a certain stipulated amount as governed by a minimum bill. In most of the signs so put out by the company referred to 4 cp. lamps are used, although in some cases 2 cp. lamps are used, and in a few, lamps of larger candle-power are installed. The consensus of opinion seems to be that 4 cp. lamps are the best for general sign illumination. In most of the larger cities the majority of signs burn until midnight, but some of the companies have a 10 o'clock switching hour, and most of the signs that burn upon meter do not average as late as 10 o'clock.

---

*Paper read before the National Electric Light Association at its 28th convention, held at Denver-Colorado Springs, Col., June 6-11, 1905.

One thing that has acted as a decided handicap to the introduction of electric signs in many cities and towns is the restriction placed by ordinance on the size and position of signs. In many cases they are prohibited from projecting more than 2 feet from the building line. In general, these ordinances were enacted before the value of electric signs to the municipality itself was fully realized. A little properly-directed effort on the part of the lighting companies will undoubtedly tend to the correction of this condition, as the benefit accruing to any town from the added illumination of its streets by means of signs is so self-evident that but little argument is necessary. A revision of the antiquated ordinances regarding signs has been accomplished in Chicago; there is still a restriction as to size, and a license of a certain amount per square foot is levied annually to provide for a rigid inspection of hanging, etc. A certain minimum number of lamps is also required, in order to prevent anyone's putting up an immense board sign with just enough lamps installed for it to be called an electric sign. The ordinance also requires that the lamps shall burn until half after 9 every evening, so as to insure the municipality's receiving the benefit of the illumination. There is no doubt that a large number of the cities and towns in this country could be induced to enact similar ordinances. It would certainly be the means of making the cities much more attractive, and would give the lighting companies a greatly augmented revenue.

The method pursued by one of the large companies last year was a persistent and systematic advertising campaign by means of letters, folders, mailing cards, booklets, return postal cards and inclosed stamped envelopes, sent to a selected mailing list secured by a thorough house-to-house canvass, including all retail merchants in all lines of business whose stores were sufficiently pretentious to possess a plate-glass window. This campaign last year resulted in more than doubling the number of sign customers. The company referred to supplies 4 cp. lamps for signs only. The above result was obtained in a city where an ordinance restricts the projection of signs to 2 feet from the sidewalk line, consequently most of the signs installed are either vertical or flat against the face of the building. Most of the large companies use electric signs for their own advertising, thus proving their faith in what they recommend to others; the effect of this is undoubtedly in the right direction.

The rather large initial cost of electric signs has always militated against their use, but recently manufacturers have been directing their energies to the reduction of this first cost, with the result that some very effective signs are now on the market which may be purchased at a very reasonable cost. One of the recent improvements is the thermostat control, by means of which a sign is flashed without the use of a flashing switch. This is only practicable, of course, on comparatively small signs, mostly for interior use.

In some cases, as mentioned before, the lighting companies furnish and install signs free of charge, these, of course, of some standard make and type; in others the customers are required to pay for same in small monthly installments. This can undoubtedly be done at a profit to the company, as signs are usually burned for long hours; and while part of this is on the peak of the load a good proportion of it is at a desirable time, and companies should bear in mind that every sign installed is a distinct and emphatic advertisement of their business. Many commodities purchased by the public are taken away and used at home, or in other places where no one but the possessor sees them, but the electric sign is meant for purposes of display and advertisement, and not only advertises the owners, but also the makers of the sign and the company that furnishes the electricity.

One of the larger companies (and possibly others) has placed the sign business in the hands of one man, who is especially qualified by experience and study to handle this branch of the business. The great majority of merchants when considering the subject, are completely at a loss as to what size and style of sign to adopt, and invariably consult the lighting company for advice in the matter. An expert should be able to advise the prospective sign customer in all matters of detail, and as the conditions are so varied and the possibilities so unlimited, judicious advice from such a source is of great value to both customer and company. No effort should be spared to insure the customer's installing the most efficient and most economical sign. It can readily be seen that there is an opportunity for the exercise of a great deal of ingenuity and good judgment in planning or selecting a suitable sign. The candle-power of the lamps installed should depend upon the location of the sign, whether same is intended for long-distance exposure, for interior use, or in narrow streets low-down on buildings, where from the nature of the surroundings the sign may be seen but a comparatively short distance.

So many matters of detail must be considered that the adoption of any standard type and style of signs is practically impossible. The lighting companies are naturally inclined to encourage the use of exposed lamp signs, as they consume the greatest amount of current; but there are a number of other types of signs that are much less expensive to construct and also to operate, such as illuminated boards, transparencies, etc. The value of a satisfied customer as a medium of advertising is universally recognized, and it is much better to equip a small customer with an inexpensive sign, which he can operate at a moderate cost and continue to operate for an extended period, than to persuade him to install an expensive one, the maintenance of which is more costly than the size and nature of his business would justify, for such an experience would naturally tend to prejudice him against the use of signs in general.

The subject of window lighting might justly be considered under this heading, as the conspicuous illumination of a show window has a distinct value apart from simply displaying the goods therein contained, for the well-lighted window attracts almost as much attention as a brilliant sign, and is the primary inducement tending to further investigation by stimulating curiosity. One notable case exists where a large store window is most strikingly illuminated with no goods displayed, nothing but cards and placards intimating what beautiful and attractive goods may be seen within. This might not prove altogether satisfactory as a permanent arrangement, but as a temporary change should prove effective, and might induce persons to enter in order to satisfy a curiosity, which, were the goods in the window, would be satisfied without entering the store. Of course the main thing is to persuade people to come in—after that the salesman must do the rest. The Boston Edison Company has installed in its exhibition rooms a sample show window with five different schemes of lighting, illustrating the effect of concealed lamps, reflector lamps, overhead lighting, side lighting, Meridian lamps and various combinations of the above-named methods; this has undoubtedly been of service to customers in determining upon what method to adopt and to the company's salesmen in advising customers along this line.

As to decorative lighting, while all light is inherently decorative, there is no artificial illuminant that lends itself so readily to ornamental and decorative effects as does electricity. In fact this is limited only by human ingenuity, and the improvements during the last few years along the line of handsome and artistic electric fixtures have been most marked. The possibilities along the line of extensive out-door decorative effects by means of electric lights have been most satisfactorily demonstrated at the various expositions held in this country during recent years. Probably the most effective and interesting display of this sort was made at the Pan-American Exposition at Buffalo. Conditions were particularly favorable there, and were taken advantage of to the fullest extent. Local out-door decorations in various cities do not appeal very strongly to the lighting companies, on account of their excessive demand for but a brief period, occurring usually at the time of the heavy normal load. They are, however, of value to the companies in opening the eyes of the public to the possibilities along this line. There is probably no system that lends itself so readily to this kind of work as what is known as the "Eblight," system, but its rather excessive first cost militates against its general use. This system is adapted well to interior decorations, and as this kind of work is something for which there is more or less of a constant demand the lighting companies may well afford to give the subject careful attention. The "Miniature Decorative Lamp Sets" gotten up by the General Electric Company are admirably adapted to a great variety of interior decoration, especially to Christmas trees.

Another field that shows quite a promising crop for lighting companies is the illumination of bill-boards. These are generally controlled by advertising concerns, who are beginning to appreciate the increased value of their space when properly illuminated. This is also appreciated by the advertisers, for they realize that the illumination of a sign-board adds about five hours each day to its usefulness, and they are willing to pay for these five hours. Some of the lighting companies whose lines extend through country districts in reaching suburban towns are beginning to light the large bill-boards displayed along railroads and highways. This should be profitable lighting wherever the boards are within a resonable distance of the company's lines.

Another type of sign which appeals strongly to the general advertiser is the so-called "talking sign." This sign, although quite expensive to install and only adapted to use in large cities, is of such versatility and attractiveness, enabling the user to present such varied and extended arguments, that it should prove a profitable investment. The lighting companies cannot afford to overlook or neglect that branch of the business covered by sign and decorative lighting, for it has already assumed decided prominence, and its future is almost unlimited. This is an advertising age, and the newer and more progressive methods are eagerly sought and adopted.

WRINKLES.*

EDITED BY H. C. ABELL.

Splitting Secondary Network Into Sections.

About a year and a half ago we had considerable trouble with our secondaries, which are all connected in a multiple network. If a primary fuse blew out it greatly overloaded the other transformers and burned out a number. We very successfully overcame this by making use of a lot of old break arms; we deadened the secondary to each side of the break arm and completed the circuit by placing a No. 12 or No. 14 copper wire across the arm. G. F. WILLARD, Denver, Col.

ELECTRICAL PATENT RECORD.

LETTERS PATENT ISSUED JULY 4, 1905.

Electric Railways and Appliances.

793,671. Electric Automatic Block System for Railways. George H. Lower, Robert H. Lower, Edward P. Lower, Winfrey W. Lee, William B. Lee and Herbert Walker, Hot Springs, Ark. Filed July 23, 1904.

793,754. Insulation. George A. Weber, New York City, assignor to the Weber Railway Joint Manufacturing Company same place. Filed Feb. 10, 1903.

793,827. Automatic Signal and Train-Control System. Henry M. Davenport, Longbeach, Cal., assignor to the American Switch & Signal Company, Los Angeles, Cal. Filed Sep. 8, 1904.

793,965. Trolley. William F. Thompson, Coraopolis, Pa. Filed Dec. 28, 1904.

794,020. Trolley-Head. Harry I. Jeffers, Tuscaloosa, Ala. Filed Aug. 20, 1903.

Electric Lights and Appliances.

793,774. Multiple Electric-Lamp Holder. Elias L. Elliott, New York City, assignor to the Illuminating Engineering Company, same place. Filed June 5, 1903. Renewed May 23, 1905.

793,952. Electrical-Lamp Fixture. Benjamin W. Perrigo, Auburn, N. Y. Filed Nov. 3, 1904.

794,028. Bulb for Incandescent Electric Lamps. Robert R. Kintz, Meriden, Conn., assignor to the International Silver Company, same place. Filed May 15, 1905.

Electrical Machinery and Apparatus.

793 722. Current Motor. Peter Henrichs, Clarkston, Wash. Filed March 27, 1905.

793,768. Motor Control. Eugene R. Carichoff, East Orange, N. J., assignor to the Otis Elevator Company, same place. Filed Dec. 8, 1903.

794,848. Electric Controller. Charles S. Reno, Covington, Ky. Filed March 11, 1905.

793,897. Electric Switch System for Blast Furnaces. Robert G. Mc Farland, Newcastle, Pa. Filed Nov. 10, 1904.

793,904. Induction Motor. William D. Pomeroy, Norwood, Ohio., assignor by mesne assignments to the Bullock Electric Company. Filed Nov. 24, 1903.

793,929. Controlling Mechanism for Variable Speed Transmission. Norman T. Harrington, Detroit, Mich., assignor to the Olds Motor Works, same place. Filed Nov. 21, 1904.

794,135. Induction-Motor. Edwin C. Wright, Newport, Ky., assignor, by mesne assignments, to the Bullock Electric Company. Filed Nov. 24, 1903.

Telephones and Telephone Apparatus

793,826. Telephone Attachment. Nero E. Damico, Redlands, Cal. Filed Jan. 31, 1905.

793,845. Automatic Take-Up Device for Telephone Connections. Frank B. Long, Los Angeles, Cal. Filed Oct. 15, 1904.

793,928. Telephone-Transmitter. William E. Harkness, Elyria, Ohio, assignor to the Dean Electric Company, same place. Filed March 18, 1904.

793,941. Telephone-Exchange System. Edmund Land, Grand Rapids, Mich., assignor to the Stromberg-Carlson Telephone Manufacturing Company, Rochester, N. Y. Filed Jan. 23, 1903.

793,971-972. Telephone-Exchange System. Harry G. Webster, Chicago, Ill., assignor to the Stromberg-Carlson Telephone Manufactgring Company, Rochester, N. Y. Filed April 17 and March 25, 1903.

794,016. Telephone Attachment. Frank F. Howe, Marietta, Ohio. Filed March 2, 1905.

794,112. Service-Meter for Party Telephone-Lines. James L. Mc Quarrie, Chicago Ill., assignor to the Western Electric Company, same place. Filed Jan. 29, 1903.

794,116. Telephone Attachment. Valetin Rebhun, Schaghticoke, N. Y., assignor of one-half to John Liddle, Hoosick Falls, N. Y. Filed Oct. 17, 1904.

Miscellaneous.

793,648-649-650-652. Receiver for and Signaling by Electromagnetic Waves. Reginald A. Fessenden, Washington, D. C. Filed Dec. 14, 1904; March 30, 1905, and April 6, 1905.

793,651. Aerial for Wireless Signaling. Reginald A. Fessenden, Washington, D. C. Filed March 30, 1905.

793,718. Wireless Telegraphy. Reginald A. Fessenden, Washington, D. C. Filed March 30, 1905.

793,760. Art of Telegraphy. Marcus O. Anthony, Barberton, O. Filed Nov. 22, 1902.

793,775. Fire and Burglar Alarm. Peter M. Esser, Chicago, Ill., assignor of one-half to Julius G. Breitenstein, same place. Filed Aug. 29, 1904.

793,802. Electric Protective Apparatus. Frederick R. Parker, Chicago, Ill., assignor to Frank B. Cook, same place. Filed July 9, 1904.

793,833. Insulating Handle Connection. John H. Gault, Philadelphia, Pa. Filed June 8, 1904.

793,881. Secondary Battery Isidor Kitsee, Philadelphia, Pa. Filed March 17, 1893.

793,896. Submarine Signal. Arthur J. Mundy, Boston, Mass., assignor to the Submarine Signal Company, Waterville, Me. Filed Feb. 14, 1903.

793,936. Electric Push-Button. Henry F. Keil, Bronxville, N. Y. Filed Feb. 27, 1905.

793,942. Supporting Device for Electric Fans. Sidney G. Leach, Ilford, England. Filed Sept. 14, 1904.

794,012. Electric Temperature-Alarm. Cowan P. Hepler, Smithton, Pa. Filed Feb 6, 1905.

794,117. Electric Spark System. Frank I. Remy and Benjamin P. Remy, Anderson, Ind., assignors to the Remy Electric Company, same place. Filed Nov. 4, 1904.

*Paper presented before the National Electric Light Association at its 28th convention, held at Denver-Colorado Springs, Col., June 6-11 1905.

THE TELEPHONE WORLD.

More Telephone Facilities in New York.

Plans were made last week by the New York Telephone Company to put in a new switchboard in the 38th street exchange, with a capacity for 5,000 lines.

A contract has been let by the company for the erection of a building for the Tremont branch at 178th street and Webster aven ue. This branch is to be equipped with a 5,000-line board.

A new board, which will increase the wires from from 6,000 to 10,000, is to be installed in the Columbus branch on West 58th street.

At the East 79th street exchange an addition of one story to the building is being made and also an addition of 17 feet to the frontage. This will increase the facilities from 5,000 to 10,000 wires.

Plans are being devised for the increase of facilities in the Cortlandt branch. An additional equipment of about 10,000 extra lines is to be installed.

Telephone Franchise for Philippines.

The Philippine Commission has passed an act granting to John I. Sabin and Louis Glass, of San Francisco, Cal., a franchise to construct telephone and telegraph systems throughout the Philippine Islands. Mr. Sabin is president and Mr. Glass vice-president of the Pacific States Telephone & Telegraph Company.

Automatic Telephones for Cuba.

Announcement has been made by the Automatic Electric Company of Chicago of the closing of a contract for 15,000 automatic telephones of the type now in use in Chicago, for the Havana Telephone & Telegraph Company of Havana, Cuba. Of these, 5,000 are to be delivered immediately. The automatic instruments are to be installed in Havana and later on throughout the island of Cuba.

The Patrons' Telephone Company was lately incorporated with a capital of $2,500, to operate from Fulton to Cato, N. Y., connecting Bowens Corners and South Hannibal, Oswego County; Ira, Cayuga County, and Lysander and Baldwinsville, Onondaga County. The directors are George D. Adams, J. D. Beardsley and A. Berne Kellogg, of Fulton; Oscar H. Livingston, of Ira; David H. Marvin, of South Granby; Willard N. Cole, George N. Butler, and Charles J. Brown, of Lysander; D. D. Arnold, of Bowens Corners; Frank B. Watson, of Floridaville and F. N. Palmer, of South Hannibal.

Mr. Alonzo Burt, president of the Wisconsin Telephone Company, is preparing a series of lectures on the telephone, which he is arranging to deliver in different cities in the State where his concern has exchanges. Mr. Burt's object is to popularize the telephone and incidentally tell the public how to get the most benefit from the service and how to avoid things which cause interruptions.

The Pennsylvania Telephone Company has placed 'phones and strung wires preparatory to opening the line at Portland in that State,

Telephone Service to Save Bathers From Drowning.

News from Salt Lake City, Utah, announces that there has been installed one of the most peculiar telephone systems in the world. Three thousand feet from the shore of the great Salt Lake has been erected a telephone instrument that is in direct communication with an exchange on shore.

The fact that several persons have lost their lives while bathing in Salt Lake before help could be summoned was the primary reason for putting in the instrument. It has proved, however, to be very popular with tourists who are able to telephone over a radius of 500 miles to friends in other States.

The installing of the instrument was a very nice piece of electrical engineering. Every joint had to be perfect and the insulation of the best and strongest to resist the action of the powerful brine of the great inland sea. It was two weeks before the telephone could be brought to a condition to work without a hitch. Now it is possible to talk to Spokane, Wash.; Denver, Col., and the cities of Wyoming, Idaho and Utah from the waters of Salt Lake.

Better Service Promised by Independent Company.

The Independent Telephone Company of Syracuse, N. Y., was lately incorporated at Albany, for the purpose of taking over the property of the Syracuse Telephone Company, the stock of which has been purchased by a syndicate composed of John J. Cummins, president of the Syracuse Lighting Company; former Mayor Jacob Amos, Gates Thalheimer, Albert K Hiscock, former Corporation Counsel Alexander H Cowie, Hendrick S. Holden and Charles M. Warner, of Syracuse; Eugene Satterlee, of Pittsford, and Thomas W. Finucaine, George R. Fuller, Frederick W. Zoller and Carl Lamb of Rochester. Each director holds 50 shares of stock.

The company which organized the Syracuse Telephone Company was composed of Dr. John L. Wentz, Joseph J. Jermyn, Ernest I. White and others.

Mr. Cowie said that the new company would improve the service by putting in a new switchboard, extending the subway system and making a new exchange. The service would be the best that could be procured, he declared, at rates 30 to 40 per cent. less than those of the Bell Company.

The Rochester men are interested in an Independent Telephone Company at Rochester which is working in harmony with Independent companies in other principal cities of the State. The fact that the Rochester men would enter the Syracuse field was made public a few days ago, but it was supposed that the members of the old company would retain their interests.

The members of the new corporation are interested in various business and financial enterprises, and have plenty of capital to carry out their plans.

The Consolidated Telephone & Telegraph Company is stringing wires and getting ready to install telephones in Coopersburg, Pa.

Another Independent Telephone Association Formed.

The Independent telephone companies throughout the section around Kewanee, Ill., have organized an Independent telephone association, taking in the following counties: Henry, Bureau, Stark, Knox, Mercer, Warren, Rock Island, Peoria, Marshall and Henderson. A meeting was recently held at which a preliminary organization was effected. F.M. Ashe of Kewanee, was made temporary chairman of the organization, and W. S. McQuiston, of Monmouth, was made temporary secretary. A committe consisting of Messrs. Daily, of Chillicothe; Chase, of Galesburg, and McQuiston, of Monmouth, was appointed to arrange a schedule of tolls.

An important consolidation of Independent lines was effected at a recent meeting held in Appleton, Wis., between representatives of Fox River Valley Telephone Company of Appleton and the Valley Telephone & Telegraph Company of Green Bay and Depere. Representatives present at the meeting state that toll lines connecting all cities of the Fox River Valley and 45 other points in the eastern and northern parts of the State with local exchanges at all points will be in operation under one management by August 1.

The Perry County, O., Telephone Company with headquarters in New Lexington, has organized for the purpose of taking over the properties of the Sunday Creek Valley Telephone Company and the Central Union operating in Perry County. The new company which is made up solely of local capitalists, will operate in every town in the county, and outside of using the long distance lines of the Bell Company, will be strictly Independent. The officers of the new company are: President, E. S. Martin; vice-president, William A. Allen; secretary, T. M. Potter, and treasurer, C. B. Enlow.

Six Telephone Companies Merge.

At the quarterly meeting of the directors of the Diamond State Telephone Company held in Dover, Del., a short time ago, the final merger and consolidation of three telephone companies in Maryland, two in Virginia and one in Delaware, was confirmed and made absolute.

The number of directors was increased from seven to ten, and large appropriations were voted for the further extension of the line to Cape Charles.

No change was made in the officers of the company.

The Nebraska Telephone Company is making arrangements to improve the McCook telephone exchange. About $15,000 will be expended in the improvements.

Telephone Incorporations.

The Fort Cobb Telephone Company, Oklahoma, Okla. Capital stock, $2,500. Incorporators: R. A. Woolridge and John H. Wright, of Oklahoma, and E. J. Luce, of Fort Cobb.

The Lamar & Barton County Telephone Company, Lamar, Mo. Capital stock, $40,000. Incorporators: J. W. Layne, J. B. McGilvray, E. J. Layne, A. E. McGilvray and M. D. Perry.

GENERAL ELECTRICAL NEWS.

LIGHTING.

Ackley, Ia —The Ackley electric light and heating plant has been sold by Smith Brothers to John Rath.

Bonham, Tex.—The Bonham Electric Light & Power Company's plant was lately sold to a Dallas firm, of which J. F. Strickland is president.

Clarksville, Tenn.—A movement has been launched here to organize a new electric light and power company. The company will be known as the Consumers' Electric Light, Power, Heating & Refrigerating Company.

Cottonwood Falls, Kan.—The Smith Light & Power Company, of Bolivar, Mo., has received a franchise from this town and will install an electric light plant here.

Fort Dodge, Ia.—A committee of five has been appointed to investigate the advisability of constructing a gas and electric light plant here to be owned by the municipality.

Los Angeles, Cal.—The city council has been requested by the Municipal League to secure advice and to make careful inquiry into the feasibility of the installation of an electric plant at public expense. to supply light for the streets and public buildings.

Missoula, Mont.—Plans have been prepared by Architect A. J. Gibson for the construction of the new plant for the electric light company.

Muncie, Ind.—After owning its electric lighting plant for 15 years or more, this city may purchase its electricity for street lighting in the future from a private company. A company has agreed to furnish power and light to the city for street lighting and other purposes at the rate of 3½ cents for 1,000 kilowatts, and it costs about double that to manufacture electricity at the city power plant. Accordingly, a franchise probably will be given to Jerome Herff, of Peru, who will obtain the power for his lighting plant by constructing a dam across Buck Creek, six miles from here, and utilizing a waterfall thus created.

Newark, O.—The Citizens' Electric Light & Power Plant was lately purchased by a syndicate headed by Congressman B. G. Dawes, of Marietta, and M. G. Gillette, of this city. The deal was said to have involved an amount in the neighborhood of $175,000. A company will be incorporated under the name of the Licking County Light & Power Company to take over the property.

Norfolk, Neb.—After months of investigation throughout the country, the city council at Wisner has decided to install an electric lighting plant here.

Penn Yan, N. Y.—The taxpayers of this village have decided by a vote of 57 to appropriate $3,500 to complete the municipal electric light plant.

Sioux Falls, S. D.—The Sioux Falls Electric Light & Power Company with a capital of $100,000 has been incorporated.

South McAlester, I. T.—The Choctaw electric light plant here was totally wrecked a short time ago, causing a loss of $10,000.

Stoughton, Mass.—A committee has been appointed to investigate the matter of changing the present arc system of street lighting to an incandescent system.

Tecumseh, Neb. —It has been decided to call a special election in the near future for the pupose of voting on the issuance of bonds in the sum of $9,500, for the purpose of installing an electric light plant.

Toledo, O.—Electric lights will be installed at Point Place. Chief Engineer Consul, of the board of public service, and City Electrician Tyler Green will complete plans and estimates of the cost of construction and operation of a municipal lighting plant for this city.

STREET RAILWAYS.

Chambersburg, Pa.—The Chambersburg & Gettysburg Electric Railway Company is to extend its lines to Greencastle, New Franklin, Brown's Mill and Middleburg.

Coalgate, I. T.—C. S. Young, representing Eastern capital, was recently here for the purpose of asking this city for a franchise for the construction of an electric railway to run from here to Atoka via Lehigh, Phillips and Midway.

Fairfield, Ia.—A very enthusiastic meeting was lately held at the Jefferson Club to discuss the proposed interurban railroad from Keosauqua to this city. E. R. Smith, R. B. Louden and others compose the committee.

Ithaca, N. Y.—The Auburn & Ithaca Traction Company has been formed here to operate an electric street railway 40 miles from Auburn to this city. Its capital stock is $400,000, and directors, Sherman Collins, Ithaca; E. B. Mosher and I. P. Hazard, Poplar Ridge.

Lake Providence, La.—The board of aldermen lately granted to the Lake Providence & Gouldsboro Railway & Power Company a franchise for 25 years for the purpose of building, equipping and operating an electric railway from here to the Gouldsboro suburb, and to Lake Providence Landing. The line is to be three miles long, and to be extended later on. The officers of the company are: Joseph L. Fischer, president; W. E. Dunn, vice-president; Edward J. Hamley, secretary and treasurer; Victor M. Purdy, W. T. Tyler, and Joseph E. Ramsdell, directors.

Noblesville, Ind.—W. B Campbell is promoting an interurban electric line between Anderson, Noblesville, Lebanon and Crawfordsville, and a corps of engineers has completed the survey between Anderson and this city. The promoter expresses confidence in his ability to finance the project.

Pueblo, Pa.—H. D. Livers will take charge of the construction work of the trolley line to be built between Mahanoy City and Tamaqua.

Racine, Wis.—An electric railway is to be installed between this city and Corliss.

Redding, Cal.—A company is forming here to construct an electric road through this city to Anderson, and across Clear Creek to Millville. The road is to cost $750,000.

Richmond, Ind.—Recent developments make it evident that the Widener-Elkins Syndicate of Philadelphia has in view securing control of the traction interests of both Ohio and Indiana. Already long steps in this direction have been taken, much of the property in both States having passed into the control of the syndicate. It is announced on good authority that the Columbus, Delaware and Marion line, operating out of Columbus, O., and owned largely by Indiana capital, is to pass into the hands of the Philadelphia people. The road is 50 miles long and one of the finest traction properties in Ohio.

Sheboygan, Wis.—The construction of an interurban trolley line from this city to Kaukauna via Manitowoc and Brillion is now a certainty.

South Bend, Ind.—George Townsend, builder of the Northwestern Traction Line, has secured the contract for the construction of an electric line from this city to Laporte.

St. Augustine, Fla.—The Jacksonville, Seashore & Seaside Railway Company has applied for a franchise to construct and operate an electric light and power plant.

Stoughton, Wis.—An electric railway between Madison and this city, with a possible extension later to other points, is an enterprise launched within the last three weeks.

Ticonderoga, N.Y.—The Ticonderoga Union Terminal Railroad Company has been incorporated to operate an electric and street surface road, five miles long. Its capital stock is $50,000, and incorporators, I. Rothschilds, Alexander H. Weed and A. B. Adkins.

Whitestone, N. Y.—A meeting of the leading business and professional men of this place was lately held here, and an organization was effected, the object of which is to induce capitalists to build a trolley line to this village. The organization was named the Whitestone Association. Frank E. Knab was elected president and Frank J. O'Rorke secretary.

Youngstown, O.—The Youngstown & Southern Railroad Company will enter this city soon and operate electric lines to the heart of the downtown district.

POWER PLANTS.

Ann Arbor, Mich.—Steps have been taken which look as if the water power along the Huron River will be greatly developed, involving the creation of an immense reservoir lake near Geddes, three miles east of here. R. W. Hemphill, Jr., has announced that a company of New York City is backing the project and has a capital of $30,000,000.

Blanche, Ala.—The preliminary surveys for the construction of the 18,000 hp. electric plant to be run by the utilization of the water power of the Little River on Lookout Mountain near here are now being made. The big plant will be constructed at a cost of about $1,000,000 by H. T. Henderson, and his brother, Sam Henderson, wealthy capitalists of Durango, Col., and their associates.

Chicago, Ill.—The Commonwealth Electric Company is about to begin the construction of another section of its great power plant at Fisk and 22d streets, to cost $450,000.

Helena, Mont.—The Missouri River Power Company is to build a second dam across the Missouri River for developing electric power at a cost of $1,000,000. The power will be transmitted to this city, Butte and intermediate points, the mines to be large beneficiaries.

Puebla, Mex.—Electric energy on a large scale is to be developed from water powers in the State of Puebla.

San Francisco, Cal.—Articles of incorporation of the Sierra Nevada Water & Power Company were filed recently. The company is capitalized at $5,000,000. The directors are G. B. Crittenden, W. L. Stowell, R. M. Kriesser, J. O. Bradford and C. H. Allen.

NOTES FOR INVESTORS.

Latest quotations for copper are: Electrolytic, 15@15⅛c.; Lake 15@15¼c.; casting, 14¾@14⅞c.

The Toledo Storage Battery Company of Toledo, O., was recently incorporated.

The Michigan State Telephone Company has declared the regular quarterly dividend of 1¼ per cent., payable to stockholders of record July 12.

The production and importation of refined copper during the first six months of 1905 is estimated at 461,000,000 pounds.

The earnings of the Boston & Worcester Street Railway Company for June were $45,415, an increase of 4 per cent. over the corresponding month last year.

A dividend of 1¼ per cent. will be paid in the stock of the Third Avenue Railroad Company of New York on August 1. Books close July 13 and reopen August 2.

In official quarters no information is obtainable concerning the reported plan which is said to be under consideration for reorganizing the Electric Vehicle Company.

The final step in the reorganization of the New Orleans Railways Company was the sale of the properties at foreclosure Saturday to the New York Security & Trust Company for $3,500,000.

Officials of the Interborough Rapid Transit Company of New York state that travel on the elevated lines, for the six months ended June 30, was fully equal to that of the corresponding period of last year.

The Electric Company of America (Philadelphia) has declared a regular semi-annual dividend of 3½ per cent, payable July 31, to stockholders of record July 20. Books close July 20 and reopen August 1.

The stockholders of the Easton (Pa.) Telephone and Telegraph Company have ratified the action of the directors in issuing $1,000,000 of consolidated mortgage bonds. The money is to be used in extending the lines of the company in the southern part of New Jersey.

John E. Blount, Jr., head of the bond department of the Merchants' Loan & Trust Company of Chicago, reports that the $250,000 of Commonwealth Electric 5 per cent. bonds purchased by the bank a short time ago were substantially all sold in 10 days.

The St. Louis & Northeastern Railway Company, which is to build a 70-mile extension of the Illinois Traction Company from East St. Louis, has made a mortgage to secure $3,000,000 five per cent. bonds. The bonds will be guaranteed by the Illinois Traction Company, and will not be issued until the property is completed.

Judge Julian W. Mack has decided in the Circuit Court at Chicago that the leases by which the Chicago Union Traction Company is in control of the street car lines of underlying corporations are valid. He has denied a motion for an injunction to prevent the company from continuing in control.

It is reported that negotiations have been completed for the transfer of control of the Connecticut Railway & Lighting Company properties to the New York, New Haven & Hartford Railroad Company. The Connecticut Company is controlled by the United Gas Improvement Company of Philadelphia.

EDITORIAL NOTES.

A Responsibility for Engineers.

The technical school and college have become fixed institutions in the United States. Although an unusual industrial activity is responsible for their multiplication at present; in the beginning, about thirty or forty years ago, it was necessary for them to prove their value. Either the world requires the technical expert to "find himself," as Kipling states, or, to extend the use of this phrase, the institution must "find itself." Either way will enlarge our vision of the possibilities of each. A new responsibility for the old-time graduates of such institutions is suggested by Prof. A. B. W. Kennedy, F.R.S., of England, in his address before the University College, London, Union Society. The men who have been away from their colleges a long time are well fitted, in his opinion, after the gaining of the necessary experience, to lecture to their younger brothers on special topics. It is self-evident that students could gain immensely by this practice, but where are the altruists to be found; and if found, must it follow that the capacity to lecture exists? Prof. Kennedy would meet with even greater difficulties in the United States than abroad in carrying out his suggestion. Sometimes a successful and experienced graduate will reappear in the old halls and lecture on a subject that represents his life work, but the occasions are very, very rare. Invitations to do so might have an effect upon some of our well known electrical experts, if extended by their old professors; but time and effort are so interpreted to-day on this side of the Atlantic that unusual influences would have to operate to make such an attempt more than a spasmodic effort. On the other hand, the electrical societies afford ample opportunity, in the way of technical knowledge, to those who desire to attend. An associate membership to the American Institute of Electrical Engineers would bring ample compensation to the student from the very class that Prof. Rankin believes should be heard within the college sanctums.

Electric Waves Directed Along a Single Path.

Privacy in communication is one of the necessities of our best signaling systems. However perfect in plan and operation such a system may be, its degree of usefulness can only be based upon its selectiveness. By usefulness is not meant the mere practicability, for experience has shown that what appears at first blush in inventive work as too much of one, frequently means too little of the other. The element of greatest promise in a new invention is its flexibility. Upon what this element depends is best understood by reference to a specific case.

In wireless telegraphy, for instance, no greater expectations could have been aroused than those whose crystallization was anticipated by dispensing with wires. To do away with wires and still to signal readily was at first glance akin to the supernatural. It would be no wild guess to state that not one-tenth of 1 per cent. of our so-called reading public have the faintest conception of how this is accomplished.

Their ideas are so wild and vague that it must be admitted their belief rests wholly upon blind faith. But when the fact became apparent that signaling through space without wires provided an opportunity to any one with an equivalent equipment to catch the message, the wonder abated in a large degree.

A better understanding of the necessary requirements of wireless telegraphy with respect to public opinion have now appeared. The most authoritative of the great daily papers in all lands keep in touch with the situation. With a perspicacity that almost amounts to intuition, they follow the brain work and experiments of our savants to the bitter end. Realizing the necessity for more privacy in wireless work, and the importance therefore of any experiments leading to a concentration of the waves employed, the news from Berlin reaching this city becomes doubly significant:

"An important improvement in wireless telegraphy is announced by Prof. Braun of Strassburg, the inventor of the system which bears his name.

"The professor has succeded in directing wireless electrical waves in a single direction. Up to now it has been possible only to transmit waves in all directions.

"Much energy is saved by the new invention."

The concentration of electric waves in the manner described, may lead to fundamental changes in the systems in vogue, Prof. Braun is one of our noted scientists, whose progressive experiments have been known to many interested students. A practical way of concentrating and directing electric waves as invented by him will be well worthy of study and experiment.

* * *

To Investigate Trade Conditions Abroad.

Action of much importance to electrical manufacturers and exporters has just been taken by the Secretary of Commerce and Labor, in accordance with the authorization contained in one of the annual appropriation bills passed at the last session of Congress setting aside $30,000 to pay the expenses of special agents to investigate trade conditions abroad with the object of promoting the foreign commerce of the United States. Under the terms of this provision of law Secretary Metcalf has dispatched five commissioners, two of whom will visit the Orient, while the others will go to Central America, South America and the West Indies. The commissioners are R. F. Crist and Prof. Hutchinson, who will visit the Orient; Charles M. Pepper, who was a delegate to the Pan-American Congress held in Mexico last year; Dr. Edward Bedloe, for many years a member of the consular corps, and Harry Burrell, a newspaper man, who will visit the countries lying south of us.

The commissioners will be attached to the Bureau of Manufactures in accordance with the terms of the act creating the Department of Commerce and Labor. In view of the limited appropriation, it has been decided that the funds at hand can best be spent in the Orient and in the Latin-American countries, rather than in the great commercial countries of Europe. It is generally understood, however, that Congress early in the next session will make a material increase in the appropriation for this work, which may make it practicable to enlarge the staff of special agents and assign several to Europe and Africa.

The instructions of the commissioners direct them to make a careful investigation of the conditions that have made it possible for American exporters to build up a large trade in certain lines, while equally energetic efforts to market other classes of merchandise have met with little or no success. Special attention will be given to an inquiry into the causes that have contributed to the success of our principal competitors in the markets in question, and all possible information on this point will be considered. In addition the commissioners will report upon transportation routes, docking and warehouse facilities, banking systems, international rail and water ways; and in the Orient a special study will be made of the obstacles in the way of the prompt transit of goods to interior points, the overcoming of which frequently adds greatly to the cost of merchandise before it reaches its final destination. Brief monthly reports will be made by the commissioners, and they will also prepare a general preliminary report for transmission to Congress in December.

UNDER THE SEARCHLIGHT.

Notes and Comments on Various Topics.

In pursuance of its plan for the extension of auxiliary electric traction lines the New York Central management some time since created a special department for the direction of these lines. William K. Vanderbilt, Jr., is now in charge of this department.

◆

The electrification of the railways between Stockholm and Vartan in Sweden, has reached completion, the first trials over the line having been made this month. The power station has been erected at Tonteboda, two De Laval turbines being installed. If the trials prove satisfactory it is probable that the local passenger lines between Stockholm and Jarfa will be taken in hand. The overhead system is employed. The above lines are State-owned and it is said that the private railway companies of Sweden are watching the experiments closely with a view to adopting electric traction. The presence of abundant waterfalls in Sweden increases the probability that electricity will be substituted for steam on all the lines of the country in the near future.

◆

Prof. Charles P. Matthews has been placed at the head of the School of Engineering at Purdue University, Lafayette, Ind., with the title of professor of electrical engineering and director of the electrical laboratory. Prof. Matthews succeeds Prof. W. E. Goldsborough.

◆

The Connecticut Senate has rejected in concurrence with the House the bill designed to allow of the incorporation of independent telephone companies, and also the bill raising a commission to investigate the action of telephone companies now doing business in that State. The action is regarded as a victory for the Southern New England Telephone Company.

◆

It is learned on good authority that the street railway companies of Chicago are preparing to file a bill which will challenge the right of the city to use any of the lines as a nucleus for Mayor Dunne's municipal street railway system. No one is more anxious than the controlling interests in the traction properties of Chicago to give the citizens of that city a first-class local transportation service and many close observers believe that they will be given an opportunity to do this sooner than is generally expected, and that in the meantime it will be proven that municipal ownership is not feasible at the present time at any rate.

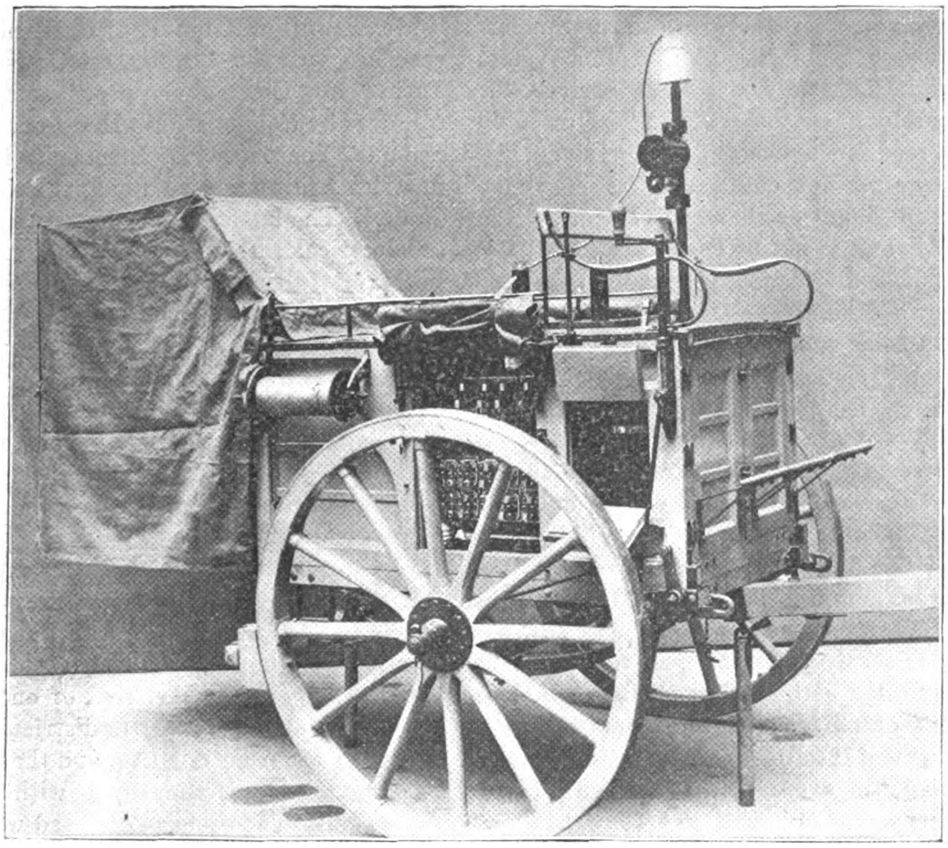
◆

The electric roads controlled by the New York, New Haven & Hartford Railroad Company are being tested by an automatic testing car, the lines between Stamford, Conn., and New Rochelle, N.Y., having been gone over by the car last week. The car makes a thorough test of the copper wires connecting the rails, and also as to the general condition of the road. The defects are recorded automatically as the car goes over the tracks. The car has been operated on over 10,000 miles of electric road in the West. The car is in charge of Clarence M. Boyden, superintendent of inspection for the Electric Railway Company of Cleveland.

LATEST GERMAN WIRELESS TELEGRAPH EQUIPMENT AS USED BY THE RUSSIAN ARMY AND NAVY.

BY FRANK C. PERKINS.

The present Japanese-Russian War has demonstrated the fact that wireless telegraphy is not only of great value in the navy, but wireless field telegraphy is also of great importance in military manœuvres as it is necessary that a fast and reliable means of transmission of news be maintained between the troops. The accompanying illustration shows a new German wireless military telegraph outfit supplied not only for use by the Russian armies but also in the military departments of Austria and Germany by the Gesellschaft fur Drahtlose Telegraphie of Berlin. This equipment is a combination of the Braun-Siemens and Slaby-Arco systems and enables the military officials to transmit their commands over long distances up to 150 km.



German Military Wireless Telegraph Outfit, Showing High Tension Side of Apparatus Car.

This transportable station consists of three cars having two wheels, each of which weighs about 600 kg., and is drawn by horse or mule. They are utilized as a power car, an apparatus car, and supply car. The station is fitted up for two wave lengths, viz., for a short wave of 350 meters, and a long wave of 1,050 meters. The aerial wire is the same for both wave lengths. With the short wave it oscillates in ¾, with the long one in ¼ wave. The outward balancing of the aerial wire takes place in the first case by a counterweight of about 6, in the last case by one of about 24 cubic meters copper gauze which are stretched out to a height of about 1 meter distant from the earth.

To carry the aerial wire kite balloons or linen kites are used. The first have a capacity of about 10 cubic meters and a driving power of about 3 kg.; the second a useful wind surface of 1.1 cubic meters, so that it is already possible with a light wind owing to the economy of gas to make use of these.

The power car contains a benzine motor of about 4 hp. coupled direct to an alternating current generator of about 1 kw. useful effect and the exciting dynamo. The circulating of the water, which is used for cooling the motor, is done automatically by a small cog-wheeled pump, and the water is cooled by a ribbed pipe system and a ventilator. The requisite benzine for the working is driven into a reservoir close to the water cask whose capacity is about 30 liters. The capacity is measured in such a manner that it will suffice for a continuous telegraph service of about 30 hours.

The igniting of the motor is electric, storage batteries being utilized which are automatically charged by the exciting dynamo of the alternating current generator. A cable drum is provided on the outside of the car to haul in the balloon, a conical friction clutch being employed in connection with the same. The apparatus car is divided by a partition into two parts, one of which contains the receiving apparatus and the other the transmitting apparatus. The high tension apparatus including the transformer, spark gap, and its accessories, are mounted in the front section while in the back part of the floor of the car are located the Morse register and Morse key as well as the receiving apparatus carefully supported upon springs. The supply car carries the gas reservoirs each of which hold 5 cubic meters at a pressure of 120 atmoshperes, as well as the balloon, an extra gasoline reservoir and various extra repair parts. In transmitting messages with the long wave the whole of the high tension transformer windings are switched in. To prevent the receiving apparatus from being connected up by mistake while messages are being transmitted a special switching arrangement is provided so that the receiver batteries, coherer, and other receiving apparatus is automatically cut-off when the transmitting equipment is connected with the antennæ. It is thus impossible for the transmitting apparatus and the receiving apparatus to be connected to the aerial wire at the same time. There are three ways for obtaining a diminution of intensity at the receiver, including a regulation through the coherer, an alteration in the connections of the receiving transformer, by moving the primary coil upward so that the secondary coil embraces but very little, and by the non-laying of the counterweight at the transmitter or receiver. It is claimed that the Schloemilch electrolytic detector is one of the most perfect yet constructed for wireless telegraphy and is very sensitive as well as very simple in construction.

MUNICIPAL ELECTRICAL ENGINEERING IN ENGLAND.

(From our London Correspondent.)

The annual convention of electricity works engineers and councillors connected with the English Municipal Electrical Association, was held at Edinburgh, Glasgow and Aberdeen from June 27 to 30. The president for the year is Mr. Frank A. Newington, the city electrical engineer of Edinburgh, who opened the convention with an address touching a number of the financial, commercial and engineering problems that have during the past year or two been troubling those responsible for the control of municipal light and power plants. The depreciation of plant, and the provision that ought to be made in respect thereof before declaring profits, was referred to at considerable length. Up to the present the Association has regarded the average life of an electrical plant as being 30 years. but the Government through the Local Government Board, has lately been showing that this idea has not its sanction, and that shorter periods will have to be adopted when making financial provision respecting their undertakings. Mr. Newington recommended engineers and others to remember that beyond the replacing of small units by large ones, and the likelihood that types of machinery might change very much during a period of 25 years, they should build up reserves in case they had to face some altogether new form of artificial illuminant. The improvement which had been made in incandescent gas mantles has made that form of lighting greatly in favor for side street purposes of late, and Mr. Newington remarked that just at present there did not seem to be any form of electric lamp that could quite compete with it, though there were several new forms, more or less in the experimental stage, that appeared to be very promising in regard to economical qualities. While enormous developments have taken place during the last 10 or 12 years in the manufacture of generating machinery "very little advance had been made in the wiring of houses or other buildings for electric light."

It was one of the station engineer's great aims to utilize his machinery during the daytime as much as possible, the sale of electricity at low rates for power or heating being adopted as a means to this end. But, said Mr. Newington, there is a weak point in this arrangement. The motors are used during the time of maximum lighting load during the winter months, and therefore, additional machinery must be provided for them. If they could arrange for the motors to be switched off during the two or three hours of maximum load for lighting in the four winter months, extra machinery would not be required, and so a very low rate could be charged. Such a system is being adopted in Edinburgh, and is also in force in a few other cities. The load factor of motors is generally extremely low, and when fixing the price of electricity for power purposes, it ought to be remembered that the cost of generating electricity is in inverse proportion to the motor load factor. The president suggested that engineers should find out how the motors connected to their systems are used during the hours of maximum lighting load in the winter months.

The first paper to be read was on "Load Factor—Its Effect Upon an Electricity Station," read by Councillor Alex. Sinclair, of Swansea. By means of various curves and tabulated data, he demonstrated the commercial and other advantages accruing from an improvement in the load factor by the on-coming of a good public lighting supply, tramway load, and the dispensing of power on a large scale to small users at cheap rates. The maximum demand system of charging sometimes becomes an obstacle to progress because the ordinary individual either cannot or will not try to understand it; therefore Mr. Sinclair threw out a suggestion that if a system simple in itself could be arrived at, whereby a customers's load factor could be readily and easily ascertained, his charge per unit could then be regulated by a discount on its rated price.

"Street Lighting" was the next topic considered. Mr. E. E. Hoadley, the city electrical engineer of Maidstone, referred to the competition of gas which has become increasingly keen during the past year in England. At Maidstone he has employed the Nernst lamp somewhat extensively for several years past, and his paper contained a good deal of data respecting the results obtained. Although still far from perfect, he regards the Nernst lamp as having been the savior of the street lighting business for the electrical world. The greatest fault he has to find with the Nernst lamps is their want of uniformity. This is most apparent in the life of the burners, as, although the average life obtained in Maidstone was 676 hours, yet they had had many burners in use for over 1,000 hours and several between 2,000 and 3,000; they had also had many which had failed before they had reached 100 hours burning. The want of uniformity was also noticeable in the way in which the candle power fell off; some burners did not appreciably drop for quite a long life, while others lost a great deal of their light-giving properties in a very short time, and would then last in that condition for a long while. As the outcome of his practical experiments, Mr. Hoadley suggested certain improvements in the manufacture of the lamps; that the burner should be made a more mechanical job, and that the actual filament when broken should be capable of easy replacement by the user at a cost of a few pence, instead of, as at the present time, the whole burner, including the heating coil and its supports and connections being thrown away, at a cost of nearly 2s. He thought that the ideal lamp for the lighting of the less important streets would be found eventually in a small flame arc lamp, taking about 100 watts, and having a magazine feed so that it would burn for some 60 or more hours without attention. The manufacturer who produced a lamp of this description, or something of equal efficiency, would reap a rich harvest. Engineers were urged to give careful thought and trials to new lighting appliances such as the mercury vapor, Osmium and Tantalum lamps, and not to always wait for the results of some one else's experiments.

Mr. Hamilton Kilgour, of Cheltenham, read a paper on "Notes on Costs and Tariffs for Electric Supply," and was followed by Councillor W. Hodgson, with one on "The Supply of Electricity in Industrial Areas from a Municipal Point of View." The latter paper contained little of electrical interest, its points having been very fully dealt with during the past five or six years, since the idea of big companies for power in particular industrial areas was first mooted in England. What was of interest in the paper was the councillor's lecturing of his municipal brethren on their failure to look properly after the power consumer in years gone by.

The question of municipalities extending their mains to outlying areas was raised by Mr. A. B. Mountain, the chief electrical engineer of Huddersfield, who discussed the necessity, etc., of one authority extending supply to districts governed by other authorities, and the engineering problems connected with such extensions. The other paper read was by Mr. A. R. Sillar, the city electrical engineer of Colchester, whose endeavor was to give a few hints to these station engineers who had never seriously considered the introduction of free wiring and the supply of current by means of prepayment meters into their towns.

During the course of the convention, visits were paid to the electric power stations of Glasgow, Edinburgh and Aberdeen, and that of the Clyde Valley Power Company, which was so recently opened at Yoker, near Glasgow.

* * *

The development of the marble quarrying industry in this country has been remarkable and coincident with the utilization of electrical machinery. In Vermont alone it is estimated that more than $5,000,000 is invested in quarry machinery and other equipment, a large portion of which is electrical.

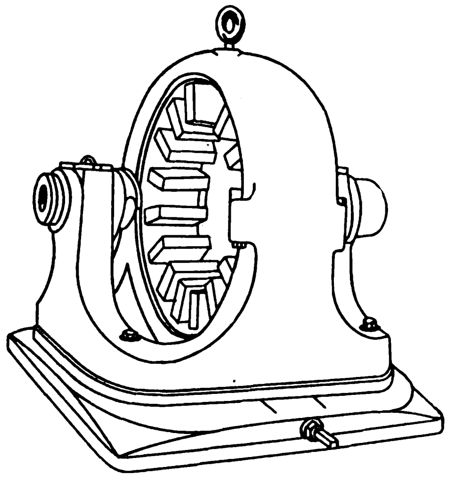
ELECTRICITY LEAFLETS.

BY NEWTON HARRISON, E. E.

THE TRANSMISSION OF POWER.

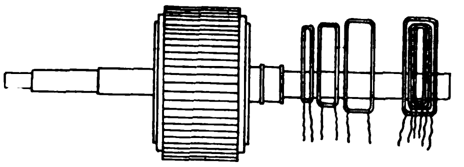
Features of Single-Phase Alternators.—To preserve a uniform pressure a compensating winding is employed in single-phase alternators. It consists of a winding situated on the armature which acts as a secondary to a few turns of the main armature winding. This current is rectified by means of a commutator attached to the shaft. It is led from the brushes pressing upon the commutator to compensating field coils.

The Compensating Coils.—The regulation of the alternator is thus accomplished as easily as in a direct current machine. In fact, in this respect, the alternator is practically a multipolar generator when part of its energy is commutated and utilized for the fields. The main energy of the fields is that received from the exciter. The regulating portion of it is received from the armature itself. Compensating coils are thus equivalent to the series coils of a compound-wound machine. This flexible combination of the two methods has made single-phase alternators thus equipped very successful. The shifting of the brushes on the commutator will be sufficient to meet and correct voltage variations. The brushes may be set when the voltage decreases, or when it rises, or to meet a certain condition of overload otherwise impossible to adequately control. The pressures developed by standard machines run from 1,100 to 2,200 volts, the alternators about 16,000 per minute. The fields are made of thin sheet steel, very soft and of high permeability. These plates are held in a mould when the frame is being cast. The poles and the frame are thus incorporated with each other. Joints are avoided by this means and a higher efficiency and better regulation results. The armatures of this class of alternators are slotted and receive a coil very readily, the teeth being cut with parallel sides. The windings are easily held in place by fiber wedges which are removable when examination or repairs to armature coils are necessary.

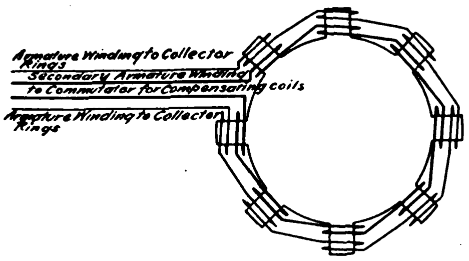


Field for 120 kw. Alternator.

The appearance of the field and armature of a 120 kw. single-phase alternator is shown in the illustrations. The principle of the winding for compensation is also shown. Some data relating to the capacity, speed, number of poles, etc., is given in the following table:

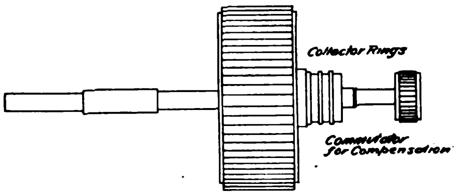


Core and Coils for 120 kw. Single-phase Alternator.



Armature Winding to Collector Rings
Secondary Armature Winding to Commutator for Compensating coils
Armature Winding to Collector Rings

The Two Windings of an Alternator Armature which Operate Compensating Coils.

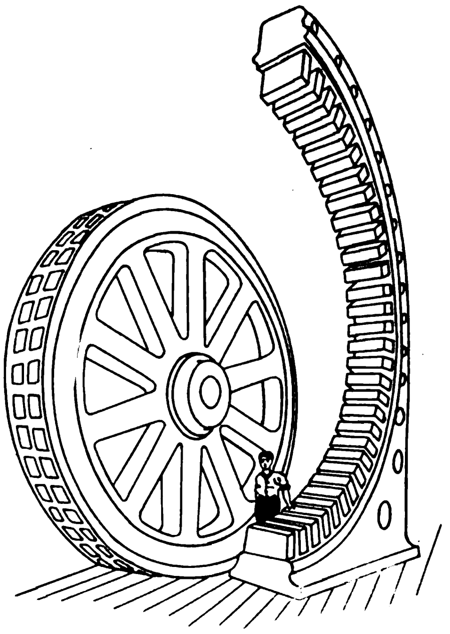


Armature for 300 kw. Alternator.

DATA CONCERNING 16,000 ALTERNATION SINGLE-PHASE ALTERNATORS.

Capacity in kilowatts.	No. of poles.	Belt speed in feet per minute.	Weight in pounds.	Revs. per min.
45	10	4,607	3,230	1,600
60	12	4,543	4,180	1,335
90	14	4,488	6,430	1,145
120	16	4,450	7,970	1,000

Engine Type Alternators.—For large plants where heavy currents are transmitted or distributed at a comparatively high pressure, the flywheel of the engine and the armature of the single-phase alternator are built in one. The vis viva of the armature is sufficient to form the function ascribed to the flywheel proper, without detracting in any way from the efficiency or capacity of the plant. The armatures in this case are built up of a spider upon the rim of which the laminated iron of the armature is secured. A huge flywheel thus results which serves as an alternator armature. This idea originated in Europe, particularly in Germany and Austria, and is satisfactory as a saver of space and expense. The coils are formed before insertion into the slots. By this means no particular work is required to make substitutions for injured coils and only ordinary care is necessary in assembling the armature. Bar winding is sometimes employed, and an illustration of a sample of this form of winding is shown. The idea is carried out also in a reverse manner, the poles revolving and the armature remaining stationary. The gigantic nature of these operations can be best understood by examining a sketch showing the comparative size of an armature and field and a man. The machine in this case represents a 1,500 kw. generator with an armature of the character described. The armature has not been assembled and the laminations of the armature have not been attached. Each year machines are built larger and larger to meet the demand for more power, due to the projection of great power transmission and street railway enterprises.

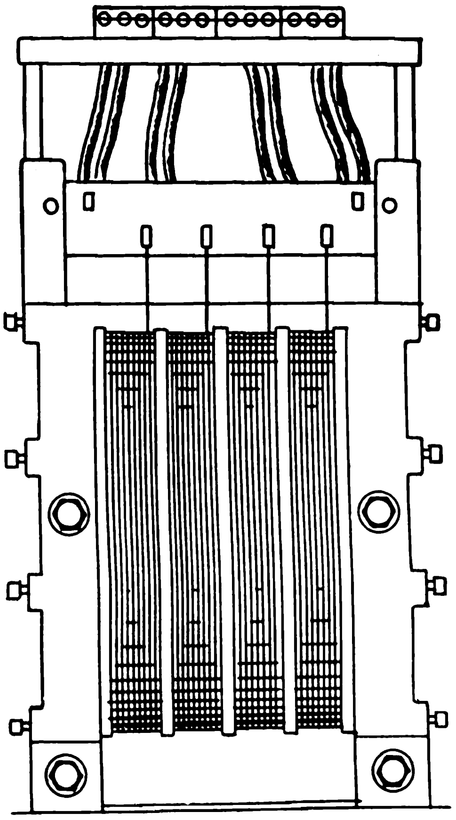


Armature Spider and Half of Field for a 1,500 kw. Rotating Armature Alternator.

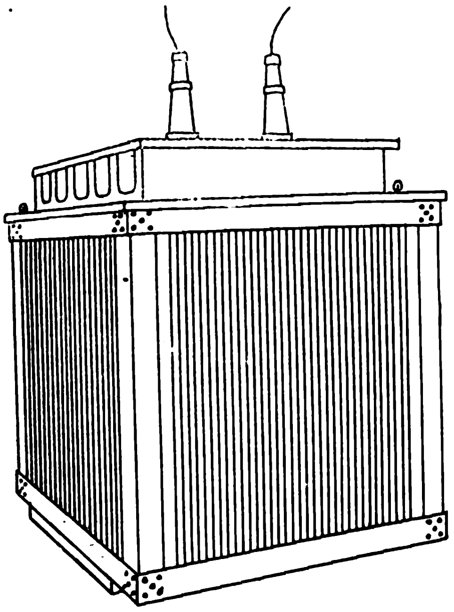
DATA OF ENGINE TYPE ALTERNATORS.

Capacity in kilowatts.	Alternations.	Revolutions per minute.
300	7,200	130
400	7,200	150
500	7,200	144
750	7,200	90

High Voltage Transformers.—The introduction of the polyphase motor of Tesla's design and the development of a high insulation, high-pressure transformer went hand in hand with the sudden augmentation in the number of successful power transmission plants installed. High pressure transformers came into vogue to meet a necessary requirement in transmission plants. They run in size from about 10 to over 500 kw. capacity. The obtaining of high insulation is accomplished by building up both primary and secondary in the form of a series of flat coils of few turns per layer but many layers, and plunging all into oil. According to the data supplied by the manufacturers of these transformers, the advantages of this construction is as follows:



500 kw. 30,000 Volt Transformer.



Case for 500 kw. 30,000 Volt Transformer.

First—It divides the total EMF. between several coils, reducing proportionately the strain within an individual coil.

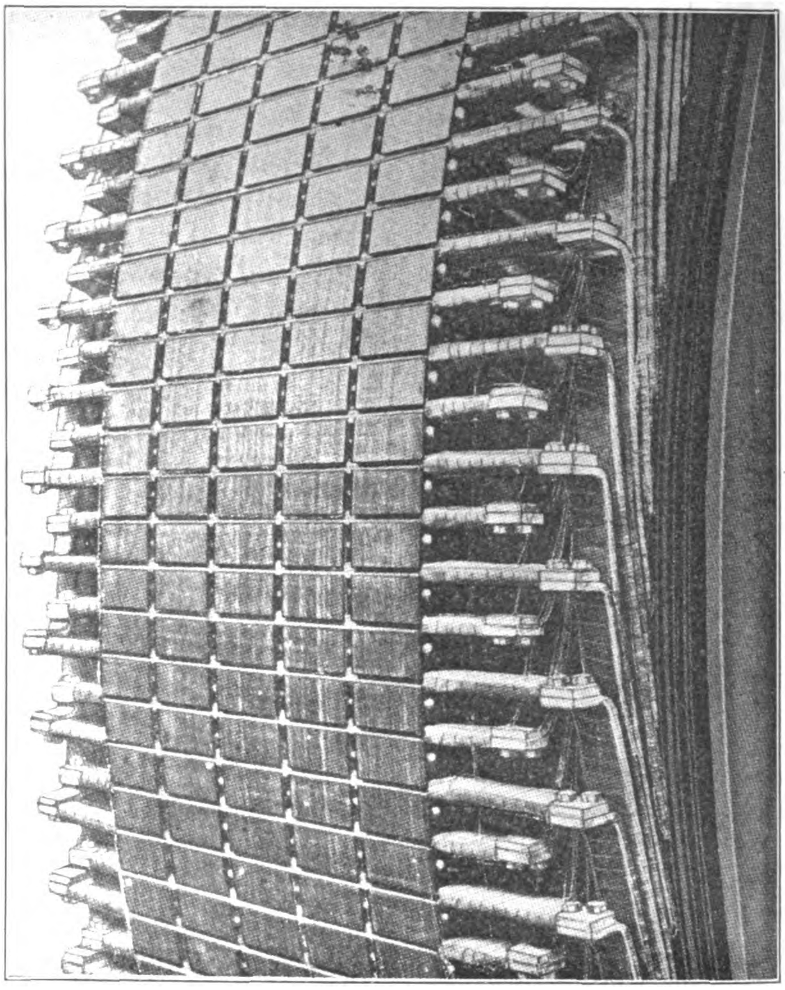
Second—It divides the EMF. in a single coil between many layers, thus reducing the potential between adjacent layers.

Third—It enables the coils to be spread apart at the ends so that a very large surface is exposed to the oil, thus providing ample radiating facilities and most thoroughly insulating the bent part of the coils.

Fourth—The regulation of the transformer is greatly improved.

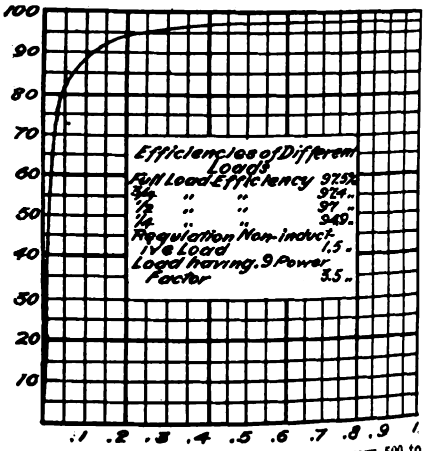
Fifth—The windings may be connected in series or in multiple giving a wide range in EMF.

Sixth—In case of damage to a coil another one may be substituted without trouble and without returning the transformer to the shop.



Portion of a Bar Wound Rotating Armature. (Referred to on preceding page.)

The use of oil is admitted to be the solution of the insulation problem when discretion is employed in the design of the coils themselves. It insulates, and also conducts away excess heat very rapidly. The difficulty of handling 30,000 volt transformers is self-evident in case of temporary injury or overload. The construction therefore must be of the best character to preserve its integrity under the strain of heavy service. The development of heat arising from the copper wire can be limited by designing the coil to have a small C^2R loss. The heat due to hysteresis and eddy currents in the core can only be controlled by fine lamination and the use of a very high grade of soft iron. The iron has been shown to deteriorate through use and become in a sense inefficient. It takes more energy to magnetize it under these conditions than iron which a test has demonstrated to be free from this phenomenon. To prepare iron for use in transformers a special treatment is necessary. Neglect of this will lead to a heavy waste of energy in the transformer a short time after being put into service. Curves showing the relationship between efficiency and load will indicate the rapid rise in efficiency with a relatively light load. They also serve to show the tendency to rise or fall in efficiency with an increasing load up to the full 100 per cent. capacity.



Efficiency Curve 150 kw. Transformer; EMF. 500 to 15,000 Volts; Alternations 7,200 per minute.

A transformer of large size, though efficient, will waste a great deal of energy which appearing as heat must be disposed of. A 100 kw. transformer, for instance, wastes 5 per cent. or 5 kw. This amount of heat will act destructively upon the transformer in the course of time and seriously affect its life. Radiating ribs are therefore supplied to the containing vessel or case, facilitating the removal of the heat. Corrugations are also employed to increase the surface for the same purpose. High pressure, self-cooling transformers for heavy service are now employed extensively on two and three-phase lines as well as for single-phase. Some interesting data in given in the following table in relation to the capacity, voltage, weight and floor space of transformers of the self-cooling type. These are used exclusively in transmission plants when the high pressures employed require substantial and reliable construction to insure continued operation:

DATA OF SELF-COOLING TRANSFORMERS OF 7,200 ALTERNATIONS.

Capacity.	Volts.	Total weight in lbs.	Floor space.	Height in inches.
10 kw.	30,000	1,485	37 x 23	60
50 "	30,000	2,328	38 x 29	70
75 "	30,000	4,400	51 x 38	70
100 "	2,000	3,850	" "	50
	10,000	3,975	" "	50
	15,000	4,150	" "	50
	20,000	4,950	" "	72
	30,000	5,125	" "	72

Two additional cases arise in power transmission plants; first, where two-phase currents are to be transformed into three-phase and three-phase into two-phase, and second, the employment of transformers in connection with rotary converters for the special purpose of meeting voltage changes without difficulty. In this latter case, the call for changes of pressure in the direct current would necessarily mean proportionate changes in the alternating current. A transformer with a means of changing the ratio of the primary and secondary winding would cover this situation successfully. By bringing connections out from the various sections of the transformer to an index and dial, regulation in this respect is readily secured. In the table of self-cooling transformers, the additional figures given show, with an increase in pressure from 2,000 to 30,000 volts, an increase in weight of from 3,850 to 5,125 pounds. The floor space does not change but the volume does to the extent of the increase in height. Transformers of higher pressure than these would also increase in weight as indicated in the rise in pressure from 2,000 to 30,000 volts, and the increase in weight corresponding to this rise. Potentials of 100 and 150 thousand volts are of service for special insulation testing and are produced by transformers built on the same lines as these.

WRINKLES.*

EDITED BY H. C. ABELL.

A Simple Remedy for Preventing the Damper Regulator from Working from Extreme Open to Closed Position.

This consists of a small plate X, about 7 inches in diameter, clamped on end of weight beam K; two pulleys, S and R, placed respectively above the plate X and the other close to the damper chain H. The small chain G to run from top of weight F over R and S to chain J, which consists of about 18 inches of chain made of 0.75-inch iron.

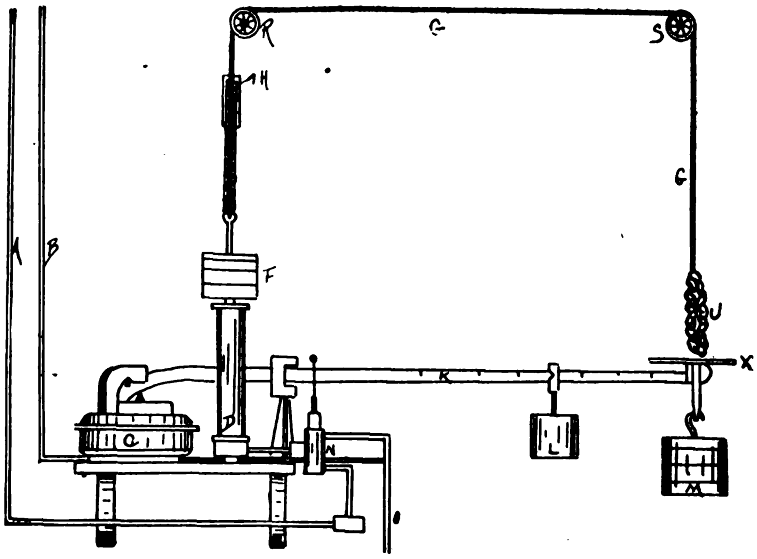


DIAGRAM OF CONSTRUCTION.

When pressure increases on boilers and raises lever K, also weight F, chain G feeds over the sheaths R and S, landing chain J from plate X little by little as the position of weight F is changed, thereby increasing the effect of weight M as damper closes, which will cause the damper to stop at several intervening points between wide open and closed positions, with a variation in pressure that will not be noticeable on the steam gauge. As the steam pressure falls on the boilers and weight F descends, chain J will be lifted from plate X, stopping the motion of the damper regulator at several points between the open and closed positions of damper.

This permits the regulator to hold the damper partly closed at all times when the boilers are not pulling at their maximum capacity, and thereby regulates the draft to the exact amount required.

EDISON ELECTRIC ILLUMINATING COMPANY, West Chester, Pa.

A Three-Phase Booster.

A three-phase transmission line is fed from central-station 'bus bars through raising transformers. It was found desirable to raise the pressure a few per cent. above that given by the raising transformers. This is accomplished by means of three single-phase transformers, with primaries wound for the 'bus bar pressure and a lowering ratio such that the secondary pressure gives the desired boost. This ratio being 10 to 1, a 10 per cent. boost is obtained by connecting the primaries star fashion, the secondaries being in series with the respective legs of the circuit. With the primaries connected delta fashion, no change being made in the secondary connections, the boost is about 15 per cent.

The primaries should not be switched in an ordinary manner from one arrangement to the other while the circuit is loaded, since the large current flowing in the secondary, with an open primary, produces dangerously high pressures in the primary coils.

If it is desired to change the percentage of boost with variations in load, this may be accomplished by means of a special switching device which will short-circuit the secondaries immediately upon opening the primaries, and which places the secondaries again in circuit immediately before closing the primaries in the other way.

With transformers of the three-wire type and some auxiliary switches it is possible to obtain four different percentages of boost, as 5, 7.5, 10 and 15 per cent.

J. M. WEED, Denver, Col.

EXTERNAL CAUSES OF SPARKING IN DIRECT-CURRENT MACHINERY.*

BY SYDNEY WOODFIELD.

The following article deals with the sparking in direct-current machinery, due to external causes, that is to say, due in no way to defective design. As a rule, a small amount of sparking for a short time is not detrimental, but owing to the roughening caused to the commutator the effect is cumulative, and it becomes, therefore, necessary to eliminate the cause of the sparking as soon as possible. White sparks are generally small incandescent particles of carbon torn from the brushes by a rough commutator, while bluish-green sparks indicate that damage is being done to the commutator segments. In railway motors, owing to their reversibility, the brushes must be fixed permanently at the neutral point, and the field cannot be utilized for reversing the current in the short-circuited coil; the commutation is, therefore, hardly ever sparkless at full rated load, and the commutator needs considerably more attention than is required for an ordinary unidirectional motor. It has been found that hard crystalline brushes (which have a lower contact resistance and lower coefficient of friction), soaked in hot liquid vaseline, give excellent results.

The following are the more common causes of sparking:—(1) Dirty commutator; (2) Weak field; (3) Excessive overload; (4) Vibration; (5) Incorrect location of brushes; (6) Unbalanced magnetic circuit; (7) Defective commutator or armature.

1. This is, perhaps, one of the most common causes of sparking troubles, and is generally due to the oil wells being allowed to overflow. The carbonized oil, with probably steel dust from the bearings, copper dust from the commutator and carbon from the brushes, forms a plastic mass which makes sparkless commutation impossible. Moreover, it forms a conducting medium between commutator bars, which can readily be seen by a number of sparks between bars. Finally, this conducting medium will form a short circuit from positive to negative brush. This dirty condition will also cause considerable heating of the brushes and commutator, and the heating may rise to such an extent as to cause damage to the insulation of the machine. In larger machines operated by cross compound engines, oil on the generator is fairly general, owing to the spash from the eccentrics; great care should therefore be paid to the oil guards, which require to be of solid construction owing to the suction caused by modern methods of ventilating armatures. To remove the oil, etc., the commutator should be cleaned with a rag soaked in benzine, and afterwards wiped over with a clean dry rag, a little vaseline being used for lubrication.

In a new machine, after the brushes have been bedded down by drawing a piece of sandpaper backwards and forwards face upwards between the commutator and the brushes, the commutator should be cleaned up with a clean rag dipped in paraffin, until it no longer picks up further carbon dust, and then thoroughly wiped over with a clean dry rag. It is always advisable to run a new machine without load for some time, in order to allow the brushes to wear down and make good contact, as good commutation cannot be expected unless at least 75 to 80 per cent. of the brush surface is in contact. Sparking may also be caused by the brushes not sliding freely in the boxes. If the sides of the brushes are rough, they should be sandpapered, and the inside of the boxes should be wiped out with benzine to prevent sticking. The brush-holders should be staggered on the studs so as not to wear grooves in the commutator. In rotary converters, an end-play device is usually supplied, which constantly oscillates the armature backwards and forwards. The Bullock Co., in its engine type generators, provides a mechanism for slowly carrying the whole brush rigging on trunnions backwards and forwards lengthwise on the commutator to prevent grooves forming. This also prevents any particular spot from aggravating the same brush or brushes, and it is usually found that the movement of the brushes removes the spot that causes the trouble.

Care should be taken to see that the springs bear on the center line of the brushes and that all the brush tips are in a straight line. It may sometimes happen that sparkless commutation cannot be obtained in any location. Alternate brushes on each stud should, if possible, be set about one bar in advance (this is equivalent to increasing the width of the brushes); sparkless running will then generally be obtained. Most modern machines have two or more brushes per stud, which can move independently. In some of the earlier machines only one brush per stud was provided, and, consequently, the slightest irregularity would cause excessive sparking.

2. A weak field is often caused in a new machine by one of the field spools being reversed; this will cause bad sparking. The polarity may be tested with a compass needle, or, if this is not handy, a small piece of iron may be held across the tips of adjacent poles; when these are of opposite polarity, the iron will be held strongly and will take considerable force to remove it, whereas, if they are of the same polarity, the pull will be almost negligible.

Akin to the above is connecting the series winding in opposition to the shunt windings; in a generator this may easily be detected by the fall in pressure as the load comes on. This fall will be considerably more than if the machine were a purely shunt wound one, whereas if the winding were connected correctly, the voltage would, of course, rise. In a motor which is designed to be similarly wound, the speed will rise if the series winding is connected in the reverse direction, whereas if it is connected to act with the shunt field, the speed will drop more than on a shunt motor. In a differentially wound motor the speed should remain practically constant for all loads.

An internal short circuit in one of the field spools will also cause a weakened field, since a portion of the turns are cut out. This will generally be detected by that particular spool being cooler than the rest, or by taking the potential drop across each spool by means of a voltmeter. The drop across the defective spool will be less than across the others. It is obvious that owing to the unequal field strengths under different poles, sparking will ensue. Sometimes the connectors between spools are not properly tightened up and vibration causes the wire to fall out, thus breaking the field circuit and causing considerable damage. The screws should be firmly driven and a spot of solder dropped on to prevent them from becoming slack. Many motors have to run on grounded circuits; care should therefore be taken with the insulation, especially between the shunt and series winding, since it has to stand the full voltage of the circuit at starting.

Unequal field strength under the poles may also be caused by not bolting up the poles or pole shoes tightly; this fault, however, will usually be found when centering up the armature, but all joint surfaces should be carefully cleaned and, except in the case of electrical ones, coated with a thin layer of oil, special care being taken with the pole-pieces and halves of the magnet frame.

---

*From the "Electrical Review," London.

Low applied voltage in the case of a motor will cause sparking if the drop in voltage is serious; moreover, as the makers usually have only one field winding for fairly wide limits, rating the speed up or down about half way in proportion to the increase or decrease (as low voltage on fields tends to increase the speed and on armature to decrease the speed, and vice versa) in voltage, it often happens that one may get as much as 20 per cent. low voltage on the machine and at the same time expect to get full rated load from it without sparking.

In a generator the poor regulation of the governor causing a falling off in speed gives a low voltage and, consequently, a lower density in the air-gap; this, as above, causes sparking owing to the neutral point shifting.

Shunting the fields of series-wound motors so as to give a higher speed is now rarely used, although it was quite common with railway motors at one time, but considerable sparking was caused by its use when going up hill, for which purpose it was never intended. On a grounded circuit a short-circuit to ground of one of the field spools will weaken the field. This fault is quickly located if the grounded coil is near the line side as the spools in circuit will get excessively hot; if near the earth side, the same test as for a shorted coil should be applied.

3. Excessive overload on a machine, whether generator or motor, will cause sparking. As is well known, the coil under commutation must be in a field of such strength as to generate an EMF. equal in value but opposite in direction to the EMF. of self-induction produced by the reversal of current in the coil. As a larger current is drawn from the machine, it is clear that a more instense field is required, but this larger current produces an armature flux which distorts the field and makes it lead the brush position and at the same time it also weakens the field, hence the brushes must be given a further lead until ultimately a current will be reached such that sparkless commutation is impossible. Modern machines allow considerable latitude in the location of the brushes for a definite load, hence, under normal conditions, the brushes are set fairly well forward, so that when an overload comes on there will be very little sparking, but should the overload still be increased, it will be impossible to prevent it. Care must be taken, however, to guard against too much forward lead, since, should the station circuit-breakers open, the machine would spark badly at no load or might even flash over.

The current density in carbon brushes should not exceed 30 amperes per square inch at full load and the tension about 2 lbs. per square inch. A greater pressure will cause a considerable increase in brush friction and consequently heating, besides undue wear on brushes and commutator. It, furthermore, leads to glowing and selective commutation. A heavy overload or short circuit on a shunt-wound generator or motor obviously acts as a low resistance shunt to the field winding and, therefore, the machine loses its field. In a generator, this will automatically relieve the machine, but in a motor, if not efficiently protected, it would result in a burnt-out armature. Care should be exercised in selecting a motor for certain machine tools, etc. Whenever the load is at all intermittent, a compound-wound motor is preferable; for instance, circular saws, pumps of the bucket type, air and ammonia compressors, etc., as if a shunt machine is used there is sure to be trouble from sparking. This matter is, however, governed somewhat by the design of machine, and the material of the magnetic circuit. A material possessing great coercive force is, perhaps, preferable.

4. Vibration is more frequent with small machines, and, in any case, it is detrimental to the proper operation of any plant. In direct-connected sets it is usually due to unbalancing of the engine, knocking of the big ends, badly designed foundations or footings, etc. The cause of the vibration should be immediately localized, as it will cause sparking and a general deterioration of the plant. In belted machines an unbalanced armature or pulley will cause trouble, but more often the cause will be found in a bad joint in the belt, which will cause a considerable amount of sparking every time the joint passes over the pulley. Belts should, therefore, be dressed smooth, and should be run with, not against the lapping; this will effectually stop jarring. The crowns of driving and driven pulley should be alike, as otherwise wobbling of the belt will result. A back and forth movement, due to unequal stretching of the edges of the belt, will also tend towards vibration.

5. Usually the makers of machines mark the correct position of the brushes on the yoke, and unless the machine is operating under abnormal conditions, this location should not be departed from. Under normal conditions in multipolar machines the brushes should be set exactly equidistant around the commutator and parallel to the segments, and the brush boxes should be exactly the same distance from the surface of the commutator. It sometimes happens—but very rarely—that better commutation can be obtained by setting each brush stud individually; this is generally caused by the poles not being spaced accurately magnetically, although they may be mechanically. With angular carbon brushes care must also be taken to see that they are slipped into the boxes the correct way. If the brushes of one stud are reversed sparking will ensue, since they are not equidistant around the commutator.

6. The field frame in all machines of the multi-circuit type must be concentric with the armature, i. e., the axes should coincide so that the air-gap will be the same all the way round; this should be carefully tested, turning the armature round into different positions in order to eliminate errors caused by the armature not being truly wound. If the air-gap is not the same there may be sparking even on light loads. The armature must also be set so that the center line of the armature horizontally coincides with the center of the poles, although sometimes this will be different. Most makers supply machines of large size with multiphase equalizing rings, these rings automatically equalizing the potential difference between brushes without regard to the centering of the armature; but it must be borne in mind that this equalization is only obtained at the expense of current flowing between the high and low sides, and therefore, as stated above, due care should be given to centering; this may be tested by measuring the pressure across each pair of brushes, all others being raised at the time and the speed remaining constant, and equalizer rings being of course disconnected. Obviously, in a two-pole machine, or a multipolar one with a series-wound armature, this fault cannot exist. Some makers allow a little wider air-gap at the bottom on new machines, so that when the bearing brushes get worn the armature becomes central.

7. On large new machines, more especially those having commutator split spiders or sectional clamping rings, it may be necessary to tighten up the commutator. When this has been done it should be frequently smoothed with fine carborundum sandpaper, and during the first month or so the segmental rings should be watched and kept tight until the commutator bar gets a firm bearing. It is advisable to do this tightening after a good long run, when the machine is hot. Sometimes a commutator may require skimming up in the lathe, but more

often it is unnecessary to do this, as good results may be obtained by stoning, i. e., by using a block of sandstone about 4 to 6 inches by 8 to 10 inches; this block should be held in a wooden holder of convenient shape, and the long surface of the sandstone made to fit the arc of the commutator. A stone made in this way will usually reduce high bars, as it will not follow inequalities in the commutator. After this has been done, a sheet of fine sandpaper should be used, and a buff finish imparted by reversing the sandpaper. This method saves considerable time and money, and insures sparkless commutation; but care must be taken to protect the armature windings and commutator leads from the grit, carbon and copper dust. If the commutator is eccentric, which is usually due to loose bearings or loose bearing pedestals, the commutator must be turned up true in the lathe. A short circuit between two bars of a commutator will easily be recognized by the blackening of the bars, and also by abnormal heating of the coils connected thereto. Sometimes it may be caused by a piece of metal getting between the bars, or by a loose piece of solder inside the commutator. More often it is due to sparking from some cause burning the mica; the spaces then get filled with carbon and copper dust, thus forming a permanent short circuit. The remedy is to clear away all dirt and scrape the space clean, and fill it up with sodium silicate and mica powder mixed to the consistency of paste. An open-circuited coil will cause excessive sparking; when running, the commutator will appear to have a continuous ring right round it. The defective coil may easily be localized, as the bars will be burned and blackened. The machine may be temporarily repaired by joining together the two bars. A grounded commutator or armature coil on a machine with one pole earthed, in the case of a motor, will usually blow the fuses; in the case of a generator, the coils short-circuited will probably be burnt out. Often considerable damage is done through the mica not wearing evenly with the copper; the mica should preferably be reduced by stoning, and then grooved out to a V shape. In large machines, never rely on testing with a magneto, since the static capacity is generally sufficiently large to ring the bell; an ordinary Wheatstone bridge or voltmeter should be used.

Lightning Effects in Germany.

According to Herr O. Steffens, says the "Electrician," London, who read a paper on this subject before the Elektrotechnischer Verein in Berlin, the number of lightning discharges in Germany causing damage has increased in the last 50 years very much quicker than the number of insured houses. If the annual number of injurious discharges per one million houses be taken as a basis, it is found that for Oldenburg, Schleswig-Holstein, Mecklenburg, Pommerania and East and West Prussia, the number is at present about 350. In the more southern parts of Germany—viz., in Bavaria, Wurttemberg, Baden and Hessen, the corresponding figure is only 150. The curve representing the lightning discharges with the time takes the form of a well-defined wave slanting upwards, the maxima occurring every 5½ years. If a curve representing the relative values of sun spots be plotted above the lightning curve, it is observed that the maxima of the sun spots occur regularly every 11 years—i. e., one complete cycle of the sun spot curve corresponds to exactly two cyles of the lightning curve. The maximum of sun spots always coincides with a minimum of danger from lightning. In the Rhine Province the number of injurious lightning discharges per one million houses has increased some 559 per cent. during the last 40 years, Next in order comes the Kingdom of Saxony and then the Province of Saxony. It appears that the danger of a house being struck by lightning is from two or three times greater in the country than in towns. An increase in lightning phenomena has also been observed in Hungary, North America and Denmark.

Electricity at the Wilkes-Barre Mines.

The use of electricity in mining has become more and more necessary to its successful operation. In fact, reports and statistics prove that the operation of mining machinery is most effectively conducted by its means. The mines at Wilkes-Barre, Pa., are a typical example of this idea. A contract has been placed, which will lead to the complete rehabilitation of the equipment there. The drills, hoisting machinery and tramways will be run by motors. The ventilation will be done by means of electric pressure and exhaust fans, and finally the lighting will be carried on by arcs and incandescents throughout the larger and smaller galleries of the mines.

Conclusions in this case have been reached only after a long series of experiences. As they are among the largest and best known mines in the world, this change may herald a transformation in mining methods all over the civilized world.

The Use of Electricity in Egypt.

The German Consul at Alexandria, in a recent report to his Government, states that the question has again been raised as to whether electricity could not be employed for motive power in Egypt. The irrigation works would constitute the most important demand. Irrigation is now carried on by means of small machines, which are spread over the whole of the district, and only irrigate comparatively small tracts. It would, therefore, be profitable to set up large power stations with modern plant. These could distribute the electricity to motor-driven pumps erected by the land-owners at the places necessary. It has been recognized that this system would be much more advantageous than the present one. A French engineer attached to the Lands Department has arranged for the utilization of electrical plant for the driver of pumps, which has formerly only been used during part of the year for ginning and pressing cotton, and the rest of the year has remained idle. A large German landowner has arranged with the firm of Siemens-Schuckert for the utilization of electric power on his estate near the Barrage.

In Upper Egypt there is the greatest opportunity for the use of electricity for motive power, owing to the situation of the Nile cataracts. With the exception of the tramways of Cairo and Alexandria, electricity is only used in Egyptian towns in a very unimportant degree for power supply. The use of electricity is limited, owing to the large cost of production, due to the high price of coal; petroleum is cheap, and the petroleum motor is therefore much more economical than the elecric motor. On the other hand, considerations of cleanliness have led to the use of electricity. Nobody has as yet introduced electric lifts for use in the large lodging houses, where the rooms are very high owing to the heat, and the staircases consequently, very tiring. The upper rooms are more desirable owing to the purer air, but are discounted because of the lack of lifts. There is also a good opening for electric ventilators in Egypt. Competition has greatly reduced the price, and 30 cm. ventilators can now be obtained for 65 francs, 40 cm. ventilators costing 85 francs. The mistake is often made in supplying goods for the Egyptian market, of considering cheapness only, without care as to the article delivered. It is necessary that the goods should be well made and reliable without being extremely well finished.

Boston's Electrical Exhibition and the National Electrical Contractors' Convention.

A large crowd has been in attendance at the Electrical Exhibition in Boston, which opened at the Mechanics' Building Saturday evening, and will continue until July 22. In addition to the large number of exhibits of electrical appliances at the exhibition there are a number of special features showing the spectacular side of electrical development.

To-day (Wednesday) the fifth annual convention of the National Electrical Contractors' Association will begin in the Mechanics' Hall Building and the sessions will continue on Thursday and Friday.

A feature of the convention to-day will be the open session. At 10 o'clock the address of welcome to the members and guests will be made by F. L. Barnes, president of the Massachusetts Electrical Contractor's Association. The address of welcome on behalf of the State will be made by Governor W. S. Douglass. The address of welcome to the city will be made by Mayor P. A. Collins.

Mr. Ernest McCleary, president of the National Electrical Contractor's Association, will respond.

Mr. Charles L. Eidlitz, of New York City, will deliver an address entitled "The Electrial Contractor." The following addresses will also be made: "The Jobber and the Manufacturer," A. L. Gorham, general manager of the Manhattan Electrical Supply Company, New York City; "The Underwriter," F. E. Cabot, of Boston; "The Relations of Inspector and Contractor," by J. P. Kennedy, commissioner of wires, of Boston.

An executive session of the association will be held on Wednesday afternoon, and at 6 P. M. the annual dinner will be given to the members of the association.

Thursday morning will be given up to a business session. On Thursday afternoon there will be a sail down the harbor to Paragon Park. Free passes will be given to all shows.

Friday morning and afternoon will be devoted to business sessions, and arrangements have been made for the session continuing on Saturday if the convention has not already adjourned.

A ladies' committee of 30 has been appointed to have charge of the entertainment of the lady guests of the association. Concord, Lexington, Bunker Hill, Harvard College and other historic and interesting places will be visited and an extended auto trip will be taken along the picturesque North Shore. Side trips for sight-seeing and shopping will be made daily. Delegates have already been reported from 39 States.

Big Fans for the Subway.

It was announced Saturday that it has been decided by the New York Rapid Transit Commission to equip the Subway stations at once with powerful rotary fans to draw the heated air out of the tunnel. The fans are to have a capacity of 25,000 cubic feet per minute and to be 7 feet in height and 9 feet in diameter.

Electrically-Operated Watertight Power Doors.

Among the few American inventions which are on display at the Naval, Shipping and Fisheries Exhibition at Earl's Court, London, this summer, a full size working exhibit of the Long Arm System of electrically operated watertight power doors has attracted great attention from the large number of naval experts who have visited the display. This system, from a central station located at a convenient point on the bridge of the ship, closes the doors and hatches of the vessel in time of emergency, providing for the local safety of men involved by a liberty action attached to each door. The device has now been installed on some thirty American men-of-war, and the Admiralty Departments of numerous foreign governments are interesting themselves in the System with a view to placing it on all their own ships. In addition to the exhibit at Earl's Court, there is another full size working exhibit on display at 39 Victoria street, London.

New Hydro-Electric Equipment.

The Abner Doble Company, engineers, of San Francisco, have recently secured the contract for the machinery to be installed in an addition to the hydro-electric plant of the Cramer Electric Company, successor to the Idaho Electric Supply Company at Hailey, Idaho. This contract covers the entire water power and electrical apparatus and includes a 400 kw. alternator directly driven by an 800 hp. set of water wheels, exciter and governor; three-panel marble switchboard; two 25-light arc transformers and 50 arc lamps with regulators, switchboards and other accessories; 14 transformers and other supplies for the distribution system.

PERSONAL MENTION.

President Charles L. Edgar, of the Edison Electric Illuminating Company of Boston, left this morning for a three months' vacation in Europe.

ELECTRICAL PATENT RECORD.

LETTERS PATENT ISSUED JULY 11, 1905

Electric Railways and Appliances.

794,194-195-196. Electric Circuits for Railway Signaling. Henry W. Spang, New York City, assignor, by mesne assignments, to Charles H. Ketcham, Yonkers, N. Y. Last application filed Oct. 3, 1903.

794,266. Electric Signaling and Electropneumatic Train-Control System. John A. Whyte, Toronto, Canada, Filed March 5, 1904.

794,269. Automatic Electric Railway-Switch. Walton D. Woolley, Normandy, Me. Filed Aug. 3, 1904.

Electric Lights and Appliances.

794,296. Electric Display-Lamp. Henry J. Gille, St. Paul, Minn. Filed Jan. 5, 1903.

794,309. Insulating-Block for Electric-Light Canopies. Isaac J. Parker, Boston, Mass. Filed Nov. 8, 1904.

794,458. Incandescent-Electric-Lamp Socket. Louis O. Gollatz, Providence, R. I., assignor to the Providence Gas Burner Company. Filed Dec. 14, 1904.

794,565. Electric-Arc Lamp. Marion A. Stogsdill, Indianapolis, Ind., assignor to the Pyle Electric Headlight Company, same place. Filed Oct. 26, 1904.

Electrical Machinery and Apparatus.

794,210. Dynamo-Electric Machine. Dimitry Balachowsky, Paris, and Philippe Caire, Levallois, France. Filed Nov. 21, 1902.

794,218. Electric Switch. Willard E. Dow, Braintree, Mass. Filed Jan. 9, 1905.

794,220. Electric-Circuit Closer. Monroe Guett, Hartford, Conn., assignor to the Hart & Hegeman Manufacturing Company. Filed Nov. 4, 1903.

794,358. Electrical Controller. Ray P. Jackson, Wilkinsburg, Pa., assignor to the Westinghouse Electric & Manufacturing Company. Filed June 6, 1904.

794,362-363. Electric Motor and Controlling Means Therefor. Benjamin G. Lamme, Pittsburg, Pa., assignor to the Westinghouse Electric & Manufacturing Company. Filed May 3, 1904, and Jan. 3, 1905

794,365. Voltage-Regulator. Paul M. Lincoln, Pittsburg, Pa., assignor to the Westinghouse Electric & Manufacturing Company. Filed June 30, 1904.

794,398. Electric Drill-Motor. Francis E. Drake, St. Louis, Mo. Filed Sept. 30, 1904.

794,435. Thermal Cut-out. Theodore Varney, Pittsburg, Pa., assignor to the Westinghouse Electric & Manufacturing Company. Filed June 24, 1904.

Telephones and Telephone Apparatus

794,343. Telephone-Switchboard. Martin C. Burt, Chicago, Ill., assignor to F. A. Meidinger, same place. Filed Jan. 28, 1904.

794,348-349-702. Telephone System. William W. Dean, Chicago, Ill., assignor to the Kellogg Switchboard & Supply Company, same place. Last application filed Sept. 14, 1903.

794,370. Telephone Lock-Out Mechanism. Thurston Matheny and Ruben C. M. Hastings, Athens, O. Filed July 22, 1904.

794,645. Insulator-Bracket for Telephone-Poles, etc. Knudt G. Springen, Zumbrota, Minn. Filed March 10, 1905.

Miscellaneous.

794,161. Medical-Battery Electrode. Kittie L. Van Guylder Curry, Chicago, Ill. Filed April 26, 1905.

794,208. Electrothermal-Bath Apparatus. Frank W. Weeks, San Antonio, Tex., assignor, by mesne assignments, to the Weeks Electrical Company. Filed Feb. 24, 1903.

794,240. Electric Storage Battery. August Meister and Alois Junker, New York City. Filed Nov. 11, 1901.

794,242. Tape-Controlled Telegraphic Transmitting Apparatus. Donald Murray, London, Eng. Filed Jan 5, 1905.

794,245. Electric Apparatus for Producing Sound-Signals. Charles H. O'Brien, Augusta, Me., assignor to the O'Brien Electrophone Company, same place. Filed July 18, 1904.

794,255. Electric Furnace. Cecil L. Saunders, Cleveland, O. Filed Feb. 15, 1901. Renewed Nov. 18, 1903.

794,334. Wireless Telegraphy and Transmission Across Space. Alessandro Artom, Turin, Italy. Filed May 3, 1904.

794,459. Wireless Telegraphy. William S. Hogg, Washington, D. C. Filed May 6, 1905.

794,497. Thermostat. John D. Gould, New York City. Filed Oct. 8, 1904.

794,501. Storage-Battery Grid. Michael Heisser, Chicago, Ill. Filed July 5, 1904.

794,580. Automatic Electric-Heat Control. James I. Ayer, Cambridge, Mass., assignor to the Simplex Electric Heating Company, Boston, Mass. Filed Feb. 6, 1905.

794,647. Electrostatic Magnetic Separator. Henry M. Sutton, Walter L. Steele and Edwin G. Steele, Dallas, Tex. Filed Feb. 3, 1902.

THE TELEPHONE WORLD.

Activity in Independent Interests in New York State.

The market activity in the stock of the Consolidated Telephone Company of Buffalo, lately, is an indication that there is lively interest in Independent telephone circles. The stock of this company has advanced nine points in 10 days, and it is said that thousands of shares have been bought and sold. The reason for this activity is found in the fact, as learned from reliable sources, that the Consolidated Telephone Company, which controls the Frontier Telephone Company and the Interocean Long Distance Company, is to be the nucleus of a gigantic Independent telephone corporation, which is to control all the Independent telephones in the State. The Interocean Company now covers two-thirds of the State with its toll lines, and has over 75,000 'phones connected with those lines. It connects with nearly all Independent exchanges in the State, and the advantage of a general consolidation of all these companies is so manifest that the movement is meeting with no opposition.

Reports show there are over 150,000 Independent telephones in New York State, with nearly 500 separate companies. The Consolidated now owns many of these exchanges, and is now planning to secure the others. Recently the large telephone interests in Rochester were optioned at nearly double their cost for apparently this same purpose, and many of the smaller plants are rapidly going into the hands of the larger companies. It is intimated that the Gould interests, which control the Western Union Telegraph Company, are inclined to give the Independent an entrance to that city, on account of the great lawsuit pending between the Western Union and the Bell. If some such arrangement is not made, an Independent system will probably be established there.

Whatever is done in this direction, it looks as though the Consolidated Company would be the chief facter in bringing all the Independent interests of the State together, for the reason that it controls practically all the long distance lines in this State and to points in adjoining States.

Pocket 'Phones for Conductors.

All the conductors of the country lines of the Westchester, Pa., Street Railway Company have been equipped with telephones of a unique design, which they carry in their pockets. In case of need these 'phones can be used at points a short distance apart on the line, where connections are supplied.

A farmers' telephone line is in course of construction between Clayton and Palm, Pa. The projectors are Henry H. Schultz, Alfred G. Clemmer, Josephus Gerhard, James B. Funk and Dr. Gery, of Palm. The line will give accommodations to about 25 farmers and business men along the route.

The 1st of August the Winnebago County, Ill., Telephone Company will have four new ines in operation and in September it expects o have New Milford connected with Rockford, and also an exchange in the latter place, havng no less than 60 subscribers. D. W. Baringham is general manager of the company.

Independent Company's Difficulty in Line Construction.

The Morgan County Telephone Company, an Independent Company of Decatur, Ala., which owns lines in other Southern cities, is building a long distance line from Decatur to Mobile via Birmingham and Montgomery. It has practically been completed from the former city to Cullman, 33 miles.

Charges are made that the American Telephone & Telegraph Company has been sending agents ahead of the Independent people, buying franchises, and that in more than one instance the Independent company has been compelled to go several miles out of the way in order to get around these franchises.

The Independent company is also building a line to Memphis, Tenn.

Report of Michigan State Telephone Company.

N. W. Harris, chairman of the board of directors of the Michigan State Telephone Company, has just issued to the stockholders the first annual report. The company succeeds the Michigan Telephone Company. Since the present management took possession in February, 1904, the number of telephones has been increased from 48,778 to 70,832. The earnings of the company have also been largely increased. It has been the policy of the present management to use its net surplus for additions and betterments to the company's property, $579,955.03 having been used for maintenance expenses alone for the year ending April 30, 1905.

The articles of incorporation of the Woodworth Telephone & Telegraph Company, of Union Springs, N. Y., were lately filed. The company proposes to build and operate telephone lines in the towns of Aurelius, Springport and Ledyard. The articles state that the capital stock of the company is $15,000, composed of 600 shares at $25 each. The duration of the company is 50 years and $10,000 of the stock has been paid in. The stockholders are Henrietta Woodworth, Oscar J. Spencer, Arthur M. Seekell, Louise M. Seekell, Charles M. Hart, Michael McGrath and LaVerne Doremus, all of Union Springs.

A new metallic circuit connecting Spokane with Tacoma, Wash., is the improvement in telephone service promised the last of this month. This line goes by the way of Clealum, and there will be no stations on the line, so that direct communication will be furnished.

The Wingo Telephone Company of Graves County, Ky., is a new concern having a capital stock of $1,500.

The Walworth, Wis., Telephone Exchange Company has increased its capital from $2,200 to $4,200.

Liberty Hill, Conn., is to be provided with telephone service. The poles are nearly all up and the wire stringing will be quick work.

The Peoples' Telephone Company, of Jacobsburg, O., recently increased its capital stock from $2,000 to $4,000.

Many Additions to Telephone Plant.

Several of the large additions and improvements which the Home Telephone Company of Utica, N. Y., has had under way for some time are nearing completion and will add to the efficiency of the system in connections with out-of-town places.

The new exchange in Newport, which was opened about a month ago, now has over 100 subscribers. Additional 'phones are being placed each week, and it is expected that the number of subscribers will be greatly increased during the next few weeks. A long distance line is now being constructed with a metallic circuit, connecting direct with the lines of the Black River Telephone Company, and direct with Utica. The new line will afford advantages now impossible on the present circuit and will make the towns and cities connected easy of quick access.

The improvements in the Clinton circuit are among the foremost in the company's plan of advancement. The new telephone building at Clinton is ready for occupancy. The new switchboard has been installed and the system connected with the underground cables which have been laid. The Clinton exchange now has over 350 subscribers.

The sytem in Utica is being improved by the addition of about 10,000 feet of cable which is being laid on several streets. The new cables will bring into the office of the plant about 900 more lines.

Other improvements which are being planned will be commenced soon. The company is rapidly placing its system in a most complete manner, as its service indicates.

The Polk County Telephone Company, formerly the Golden Rod, has lately held its annual meeting of the stockholders in Osceola, Neb., and admitted a new stockholder, M. F. Smith, by selling him a one-fifth interest in the company, so that there are five stockholders, O. E. Mickey, A. F. Nuquist, H. D. Skelton, E. R. Stanton and M. F. Smith, three from Stromsburg and two from Osceola.

A $20,000 switchboard has been purchased by Col. E. H. Beggs, of the Independent Telephone Company, of Boise, Ida. It is one of the latest designed central energy double lamp supervisory multiple switchboards and will have a capacity of 6,000 lines for 24,000 subscribers. The board will be installed in the new headquarters about September 1.

With a capitalization of $25,000, the Wehn Telephone Company, of Bridgeport, Neb., has been incorporated.

The Driftwood, Pa., Telephone Company, capitalized at $10,000, has lately been formed.

The Telegraph & Telephone Company, of Towanda, Pa., is capitalized at $10,000.

Telephone Incorporations.

The Polo Mutual Telephone Company, Polo, Ill. Capital stock, $5,000, Incorporators: John Eckerd, C. W. Hays and C. C. Price.

The Hiram Telephone Company, of Portage County, Hiram, O. Capital stock, $10,000. Incorporators: H. C. Hurd, W. M. Dudley, E. E. Snoddy, H. F. House and G. A. Vincent.

GENERAL ELECTRICAL NEWS.

LIGHTING.

Burlington, Kan.—A deal was lately completed by which the electric light plant of this city was transferred to a new firm. The purchasers are G. H. Webb, of Halstead, and G. Woebe, of Junction City.

Cicero, Ind.—John Plan has completed arrangements to put in an electric light plant here.

Clatskanie, Ore.—The Shakes Transportation Company, of Portland, is negotiating with the Clatskanie city council for the erection of an electric light plant, and the council will probably vote favorably at its next meeting.

Covington, Ky.—A proposition of the Union Light, Heat & Power Company to light the streets of this city with electric lamps for one year, with the privilege of renewing the contract, was lately accepted by the council.

Elmwood, Ill.—E. L. Brown, of the Elmwood ElectricLight Company, will ask for a franchise from the village of Brimfield to extend his wires to light that city.

Frederick, Md.—The Frederick Electric Light Company is arranging with the board of commissioners of Middletown to light that town with electricity. Middletown is eight miles west of here on the National pike, and current will be transmitted from this city.

Fredericksburg, Va.—The Rappahannock Electric Light & Power Company has been incorporated with a capital of $10,000. The officers are: J. B. Ficklen, president; A. D. Tapscott, secretary. The object of the company is to erect and establish an electric light and power plant.

Greenup, Ky.—Col. E. E. Fullerton and Hubert Willis, of this place, have announced their intention of putting in an electric light system at Russell.

Jefferson, Tex. —The Jefferson Light & Power Plant, including a new electric light and ice plant, was recently burned. The estimated value, $17,000 to $18,000; insurance $15,000.

Lee's Summit, Mo.—H. C. Thomas, of this place, has been named as the temporary receiver of the Electric Light Plant Company here by Judge Park, of the circuit court.

Lewisburg, Pa.—The Lewisburg gas and electric light plant was recently purchased by Philadelphia capitalists.

Memphis, Tenn.—Commissioner John T. Walsh has prepared a resolution directing compliance by the city with the act of the last legislature which requires the construction of an electric lighting plant. The resolution will be presented to the council at the first meeting at which the call leaves an opening for its consideration.

Morelia, Mex.—A company has been organized here to acquire the electric lighting plant of this city, which is now operated by steam power, and to establish a water power plant of 2,500 hp. to operate the system and also to furnish power in other industrial enterprises. The power will be derived from the San Pedrito waterfall in the vicinity of this city.

Norwalk, O.—The Bell Island Improvement Association has voted to have electric lights on the island, to repair the walks, and to do other things for the general betterment of the summer resort. New officers were chosen as follows: President, Jesse M. Ferris; vice-president, Richard H. Golden; secretary, James H. Seeley; treasurer, Dr. J. J. Strohmeyer.

Paul Smith's, N. Y.—The Paul Smith's Electric Light & Power Company, capitalized at $100,000, has been organized with the following directors: Paul Smith, Sr., Phelps Smith and Paul Smith, Jr.

Portland, Mich.—The electric light plant here will be enlarged and improved next month.

Richmond, Va.—At the recent meeting of the water committee, that body unanimously adopted the report of the sub-committee, indorsing the proposed new electric light plant to be erected on the site which is now occupied by the old pump house.

Rural Retreat, Va.—W. C. Lawson contemplates installing an electric light plant at the Rural Retreat Mills, and will probably furnish light and power for this town.

Spring City, Pa.—It is said that plans for the new electric light plant are rapidly being perfected. Well-known local capitalists are at the head of the proposed company.

Villa Grove, Ill.—It is believed that this village will soon be lighted with electricity. The board of trustees is making investigations with a view to passing an ordinance providing for such service.

STREET RAILWAYS.

Austin, Tex.—The charter of the Gainesville, Whitesboro & Sherman Electric Railway Company was lately filed with a capital stock of $500,000. The incorporators are G. A. Hassinger and H. L. Lazarus.

Brazil, Ind.—Indianapolis and Eastern capitalists have filed with the Secretary of State for the incorporation of a company to be known as the Indianapolis & Ohio Valley Traction Company, with a capital of $250,000. Joseph H. Larimee, of Indianaplis, has been elected president, and David H. Morgan, of this city, secretary of the corporation. It is the purpose of this company to build a traction line of over 300 miles.

Clifton Heights, Pa.—After a spirited session the borough council lately granted the Philadelphia & Garrettford Street Railway Company the right to construct and operate a trolley line in this borough.

Creston, Ia.—The building of the Oskaloosa-Buxton Interurban Trolley Road now seems almost assured. A company has been organized with a capital of $500,000 for the purpose of constructing the road.

Dayton, Wash.—The project of an electric railway in Columbia County appears to be growing in public favor. Many farmers, some of them the wealthiest in the county, have expressed themselves as willing to encourage such an enterprise by liberal contributions.

Dodd City, Ark.—The Mineral Belt Traction Company, of Chicago, has been formed to build a line between this city, Kingdon Springs and Lead Hill. Its capital stock is $200,000. The incorporators are A. J. Bradford and Robert Somerville.

Gulfport, Miss.—Work has been commenced on an electric railway that will connect Biloxi and Pass Christian, and eventually link Mobile and New Orleans. The company that is building this line in capitalized at $1,000,000, with Captain Joseph T. Jones the president. The power house will be located here and will cost $200,000.

Janesville, Wis.—Surveyors have begun the work of laying the route of a proposed electric railway line from here to Waupaca. The capital is to be furnished by Philadelphia parties.

Lynn, Mass.—The Nahant & Lynn Street Railway Company has been authorized by the Railroad Commission to capitalize the cost of building and equipping its electric railway at $50,000.

Milton, Ore.—That this city will soon have electric car service to Walla Walla, Wash., is now an assured fact. Mr. Anderson, who has the road in charge, has stated that the line is to be built at once, and that $35,000 is now on hand to begin the work.

Nevada City, Cal.—Work on the electric road from here to Marysville will soon be under way, and before many months the road will be in operation.

Oberlin, O.—The Oberlin & Lorain Railway Company proposes to build an electric road between this city and Lorain, running by the way of North and South Amherst. William S. Donaldson and G. F. Herrick, of Lorain, are the directors.

Oran, Mo.—The Oran Electric Railway Company has been incorporated with a capital stock of $50,000. M. G. Gresham and George Metz are the incorporators.

Richmond, Va.—The Grasberger Trolley Company was lately incorporated with a capital of $10,000. The officers are: Hiram T. Gates, president; Boniface A. Grasberger, secretary and treasurer

Somerset, Va.—A deal will soon be closed between Dr. W. Godfrey Hunter and others, O. H. Waddle and the Somerset Company for an electric railroad franchise.

Sutton, W. Va.—The Elk River Railway & Electric Power Company of this city has been incorporated to build an electric railway about five miles long from Gassaway to this city. The incorporators are George H. Borlean, of Pittsburg; W. H. Cochrane, of Dawson. Pa.; J. T. Berry, of Hesters, W. Va.; L. W. Martin and John B. Morrison, of Sutton.

POWER PLANTS.

Danville, Ill.—Plans are being matured in this city by H. C. Hoaglund, of the Illinois Traction Company, for a new power plant at Bloomington, or the remodeling or enlarging of the present plant.

Oroville, Cal.—The Oroville Light & Power Company is preparing to put in a large power plant on West Branch.

St. Johnsbury, Vt.—An important business deal has been consummated, by which the St. Johnsbury Electric Company has acquired of E. T. and H. K. Ide, of this city, the water power at Passumpsic. The company will erect at once a modern station to supply more power and lights for St. Johnsbury.

York, Pa.—Deeds giving possession to severa thousand acres of land in York and Lancaster Counties, along the shores of the Susquehanna River, to Cary T. Hutchinson, a New York capitalist, were placed on record this month. They represent another large number of real estate transactions closed by the promoters of the project to build large hydro-electric power plants along the Susquehanna.

NOTES FOR INVESTORS.

Latest quotations for copper are: Electrolytic, 15@15⅛c.; Lake 15@15⅛c.; casting, 14⅝@14⅞c.

Earnings of the Philadelphia Rapid Transit Company are said to be running $14,000 a day ahead of last year.

On June 30, which closed the fiscal year, the Boston Edison Company had a floating debt of $825,000, against $1,083,000 on June 30, 1904.

Arrangements have been completed for the transfer of the municipal lighting plant at Elgin, Ill., to the Traction Company of that city.

Gross earnings of the Metropolitan Street Railway system of New York for June were $1,887,834, the largest for any June in its history.

Justice Gildersleeve of the Supreme Court, New York, has filed a modified order giving the New York Board of Estimate and Apportionment full power to approve plans and consent to construction of new rapid transit routes.

A special meeting of the shareholders of the Massachusetts Electric Companies is called for July 28 at noon in Boston for the purpose of authorizing the refunding of $2,700,000 5 per cent. coupon notes which mature January 1, 1906.

Stockholders of the Philadelphia & Garrettford Street Passenger Railway Company on Saturday authorized an issue of $3,000,000 fifty-year 5 per cent. general mortgage bonds. The stock of this company is owned by the Philadelphia & Westchester Traction Company.

John I. Beggs has been unanimously elected trustee for the creditors of the National Electric Company of Milwaukee, Wis. Statements made by attorneys were that the business of the company had been conducted at a profit during the receivership. The bond was fixed at $500,000.

A director of the Chicago Edison Company says the earnings of the company are well in excess of all previous exhibits in the history of the concern. There has been more work done and a larger number of new subscribers for current added during the last six months than ever before during a similar period.

The Frank Jones Electric Light & Power Company's plant at Portsmouth, N. H., has been sold to the Rockingham County Electric Light & Power Company. The Jones plant has been taken by the reorganizing committee of the New Hampshire Traction Company, of which the Rockingham County Company is a part.

The statement is made, but not officially, that earnings of the Allis-Chalmers Company are large and that a sufficient surplus is being accumulated over and above money now being expended for extensive improvements to pay a dividend at the regular rate of 7 per cent. on the preferred stock. It is said to be simply a question of policy when payments should be begun.

N. W. Harris & Co., New York, are offering to investors $1,200,000 Omaha Electric Light & Power Company first mortgage 5 per cent. bonds, due July 1, 1933, but optional at 105 and interest on and after July 1, 1908. This company owns or controls practically the entire electric light and power business in Omaha, South Omaha and Council Bluffs, the combined population of the cities being at present more than 170,000. The company and its predecessor have paid annual dividends of 5 per cent on the preferred stock for the past fifteen years.

EDITORIAL NOTES.

Electric Lamps and Light Mixtures.

The difficulty in obtaining good light does not depend upon the pressure or the regulation of the generator as is commonly supposed. The value of an illuminant is entirely dependent upon the light mixture it affords. This is hardly a subject which can be classed as purely practical from either the artisans or manufacturers' point of view, yet a little reflection will serve to show how utterly futile are the attempts of lamp makers, whether electric or otherwise, to produce good light unless they follow the road pointed out in the laboratory. This bit of practical science is simple enough to understand with reference to sunlight as a standard.

The prevalent idea is to emulate this example as far as possible, to produce, if the effort is not beyond our scope, artificial daylight. But then the question naturally arises "what is artificial daylight?" In what respect does it differ from the light of a candle, oil lamp, Welsbach burner or incandescent lamp, etc.? An analysis of artificial daylight discloses the fact, well known to every reader of an elementary physics, that white light is composite. The violet, indigo blue, green, yellow, orange and red of the traditional spectrum are fused or mixed together in ordinary daylight.

Experiments have shown that an excess of yellow or red, of blue or green, or, in fact, theoretically of any other color in the light of a lamp or source of illumination is a defect. It is not a quantity of light that is wanted as much as a quality of light. This is by far the most important point as far as our æsthetic sense is concerned. It is not pleasant to see by a light which destroys the customary relationships of color. The absence of one element from the light mixture may be the cause of this phenomenon. The presence of a superabundance of a certain class of waves may be equally capable of producing unusual effects.

The Welsbach mantle, for instance, is notoriously deficient in red rays, producing the appearance of pallor and a greenish tinge on healthy countenances. Quantity of light is, of course, a desideratum of the first order, but it will not be a popular form, however cheap, unless accompanied by the proper color. Arc lamps are frequently affected by an excess of violet rays quite noticeable in many public places. The voltage and carbon are the cause in this case and should receive attention.

Incandescent lamps, as well as arcs, produce rays which radiate wastefully. On this account, a general redesign has been gradually accomplished, which yields in both instances phenomenally good results as compared with the crude and inefficient lamps of the past.

* * *

Maintenance of Submarine Cables versus Wireless Telegraphic Apparatus.

The wireless field is unlimited in its scope and possibilities, and the reason for this belief looms up larger and larger with each new success in its inevitable development toward perfection. The financial management of a cable system would not hesitate to acknowledge the existence of an expense account for maintenance that is regarded as one of the unfortunate concomitants of the business. They could, if requested, produce interesting little items for repairs, representing, for instance, the sum of $375,000 in connection with one break on which a 116-day effort was spent in patching it up. They might turn back the pages of the ledger and show that the cost of maintaining a repair ship, with its staff of experts and accessories, runs up to $1,500 a day. But to be just, it is necessary to state that these figures, though honestly recorded, are not established year in and year out. It has been calculated that the average expense belonging entirely to the field of repairs in the case of each Atlantic cable does not fall short of $40,000 a year. The interest on the original investment, in addition to this sum, shows clearly an enormous annual expense, before a dollar can be made for the stockholders.

Let us glance at the situation with regard to wireless telegraphy. Here is an opportunity for striking out entirely from the expense account the element of repairs as it appears above. Not only is this element entirely removed but in certain respects a greater certainty in transmission is obtained, despite the apparent intangibleness of the operation. The old idea that energy must pass through the channel or wire we provide is about to be relegated to the scrap heap of ultra-conservatism. Nature herself is employing the wireless method in all operations. The physicist will frankly admit the absence of any means of communication between molecule and molecule, or mass and mass, except that supplied by the universal plasm—the ether itself. For this reason there is no elusive theory to be followed out by the wireless telegraph expert. His task has become one of the engineering propositions of the present. It is so definite to-day, that the dollars and cents end of it can be estimated with accuracy. The cable and wireless are established as far as we can see. The next point to consider, after all is said and done, is the degree to which the general public will receive benefits. How much less will transatlantic messages cost when competition sets in than at present? When will these methods of communication prove legitimately attractive to the man that works by the sweat of his brow?

* * *

Is the United States Developing an Export Trade in Automobiles?

With automobiles of French-make, costing from $15,000 to $30,000, it is interesting to inquire into our own automobile industry. We take pride in our mechanism and methods; in our deftness and cheapness of production. Where are we at in the international competition in automoble construction?

America is destined to forge ahead in all her mechanical and electrical enterprises. She is now developing an export trade in automobiles. In 1903, ending with May, we exported $1,038,792 worth of autos; in 1904, $1,713,807 worth, and in 1905, $2,167,744 worth of these vehicles. Statistics are regarded by some as delusions, but it is necessarily scientific to admit their veracity if properly founded. The question abroad is always quality and price. It is, of course, the same here. But the German, Frenchman or Englishman will think twice before he spends more money on a machine of home manufacture of only equal quality to that of American-make. If exports in 1903 are nearly doubled by those of 1905, it is reasonable to presume that the United States is living up to its reputation as a nation of fine mechanics. European makers may soon find they are carrying coals to Newcastle, if American ability has not been over-rated in similar instances.

UNDER THE SEARCHLIGHT.

Notes and Comments on Various Topics.

Dr. Gisbert Kapp has accepted a professorship in electrical engineering at the University of Birmingham, Eng., and has resigned as general secretary of the German Association of Electrical Engineers and as editor of the "Elektrotechnische Zeitschrift."

◆

The city officials of Columbus, O., after a thorough investigation, covering four years, have discovered that municipal ownership of an electric lighting plant is not a paying investment.

◆

Gov. Higgins of New York has appointed Frederick E. Gunnison of Brooklyn as State Commissioner of Gas and Electricity. This fills the commission. The other members of the commission are John C. Davies of Oneida, and Lucien L. Shedden of Clinton.

◆

The new power house of the Brooklyn Rapid Transit Company at Kent and Division avenues, Brooklyn, N. Y., is rapidly approaching completion and it is the expectation that by August 1 the installation of electrical machinery will have been begun there.

◆

Work is about to begin on the new mountain railway which is to make the snowy heights of Mont Blanc accessible to the ordinary tourist. The line will start from the little village of Le Fayet, at the western end of the Chamonix valley and will ascend by a wide sweep up the northwest side of the mountain. It will terminate not at the actual summit of Mont Blanc, but on the plateau of the Aiguille du Gouter, which is 12,700 feet high. From this point the ascent to the actual summit of the mountain, which is 3,000 feet high, can be comfortably accomplished in about 4 hours. The line, which will be on the same principle as the Jungfrau electric railway, will be about 12 miles in length and it is expected to be completed in 5 years. The journey from Le Fayet to the "summit" station will take 4 hours, and a return ticket will cost $20.

◆

Mr. George Tripp, secretary, writes us that the annual convention of the Colorado Electric Light, Power & Railway Association will be held at Glenwood Springs, September 18, 19 and 20.

◆

An official trial of a submarine signaling apparatus by the German Admiralty has taken place in Kiel harbor, and proved so satisfactory that an order for the adoption of the apparatus was at once given. A bell weighing 140 lbs. was suspended at a depth of 20 feet from the Gabel Flasch lightship, and the sound was heard with such distinctness at a distance of 3½ miles that its direction could be readily located with precision. At a distance of 5½ miles the sound was heard in sufficient volume but was disturbed by other sounds in the harbor.

◆

Assistant Secretary of the Navy Darling has issued orders for the consolidation of the power plants at the navy yards at the following places: Brooklyn, Boston, Philadelphia and Norfolf. It is estimated that the merging of the plants at the Brooklyn yard will save between $10,000 and $15,000 a year.

◆

Work on the plans of Mayor Dunne's 240-mile municipal street railway system in Chicago has been started. A. B. Dupont, the Detroit traction expert, will at once begin the task of mapping out the routes of the proposed system. He will prepare estimates of the earning power of the various lines of the system and the cost of operation, but will not go into the cost of construction or any of the engineering features of the plan. These will be left to Bion J. Arnold, the local transportation committee's expert. Mr. Dupont will confine his efforts to laying out the routes of a system on streets on which the franchises have expired and devising plans for connecting lines where breaks occur in the proposed municipal system. He will endeavor to assemble all the expired franchise lines into a unified system.

TELEPHONE GROWTH IN SOUTHERN CALIFORNIA.

BY P. KERR HIGGINS.

Three years ago there was only one Independent telephone exchange in all Southern California, and that a very small one. To-day there are 19 in actual operation and 10 more in course of construction at Downey, Oxnard, Redondo, Santa Paula, Alhambra, Saticoy, Anaheim, Fullerton, Ocean Park and Santa Monica. The first exchange was located at Monrovia and for a long while was the thorn in the side of the great Bell sub-licensee, the Pacific States Telephone & Telegraph Company. The town of Monrovia is very beautifully situated at the foot of the Sierra Madre Mountains and is one of the best residential towns in all California. It boasts a population of 4,000, and the exchange opened up with less than 100 subscribers; to-day it has nearly 400. This is a fair sample of the progress being made in this part of the country. The following table shows the standing of the various exchanges as of February 1, 1905, and these figures are being increased every day:

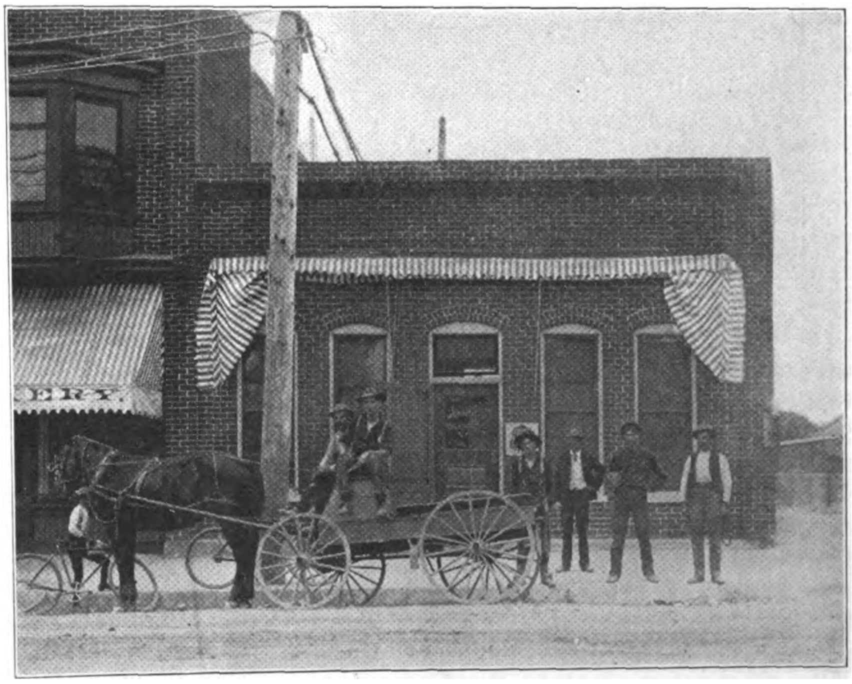
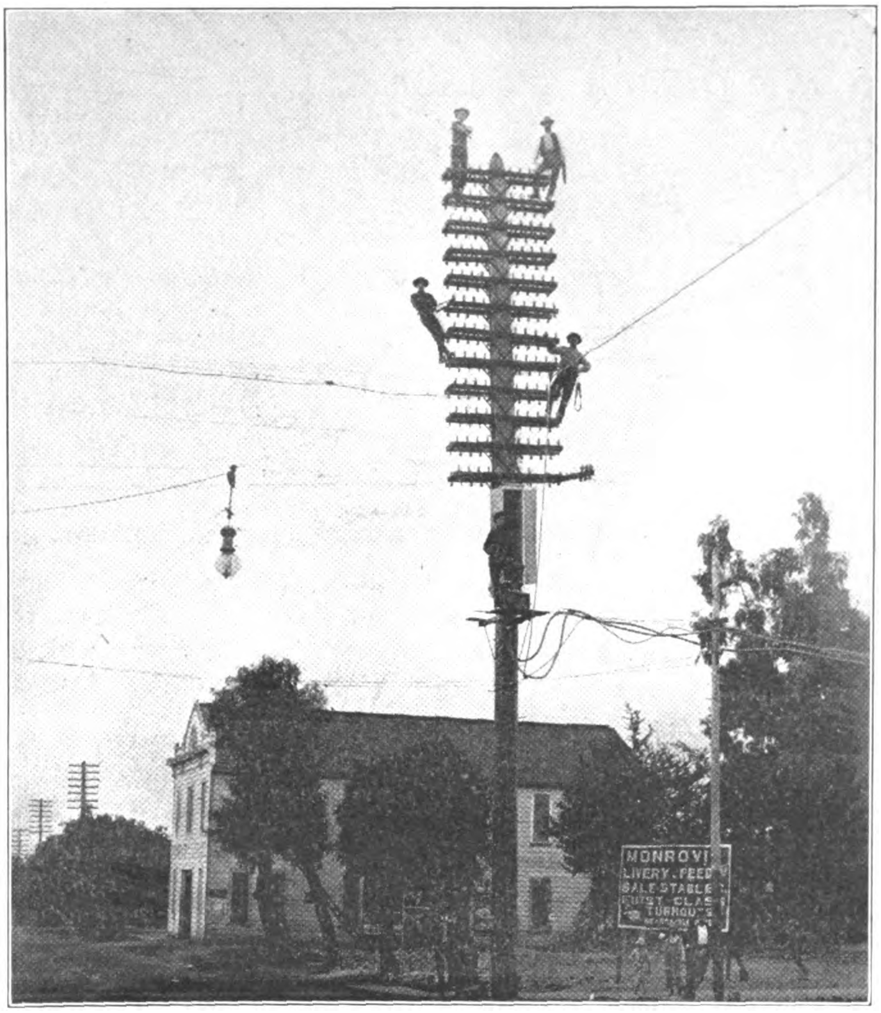
Smeltzer	1	160
Monrovia	2	325
Fernando	3	51
San Diego	1,500	1,200

The construction work at Monrovia was done by men having had very little experience in the telepone business, but with the advent of Eastern capital and experienced men in the building of the Los Angeles plant, Monrovia saw how necessary it was to rebuild the plant and so a new company was formed, and Mr. Baldwin, an experienced man who was employed as manager, took charge about a year ago and during that time has wrought many changes, improving the service and the plant. The next exchange to open was that of Covina and a little later that of Los Angeles; the others followed rapidly and the end is not yet. The Covina exchange was erected by that energetic builder, Mr. P. T. Spencer of Los Angeles, who also built the Whittier exchange and is now adding to his list Downey and Norwalk, which will open up next month.



Southern California's Pioneer Independent Telephone Exchange.

The Los Angeles plant like the majority of the Southern California exchanges was built by the Empire Construction Company of Toledo, O., under the general managership of the veteran builder, Mr. F. F. Graves, assisted by his able superintendent, Mr. F. W. Wachter. The contract called for 3,000 lines and was completed and accepted by the Home Telephone & Telegraph Company, of Los Angeles, on or about September 1, 1903, having then something over 5,000 working lines. The remarkable growth of this new exchange can be seen from the report given out by its directors at the end of its first year. This report gives the net earnings for the four quarters as follows: $22,359,61, $31,817.51, $36,-474.93 and $37,921.22.



Monrovia's Independent Telephone System.

Los Angeles has a permanent population of about 120,000. Since this report was issued several sub-exchanges have been opened at Hollywood, Boyle Heights, East Los Angeles, Highland Park, Garvanza, Vernon and Prospect Park, which brings the total number of subscribers now connected to the Los Angeles exchange system up to almost 20,000; this includes over 100 private branch exchanges and intercommunicating systems. With the exception of Hollywood, which was the first branch, all of the branches are of the Strowger automatic type.

The equipment of all of the exchanges (with the above exception) are of the Kellogg full central energy type.

The Pacific States Telephone & Telegraph Company has waged a relentless war against the Independent movement on the Pacific Coast, but all to no avail, as the record shows one continuous march forward. Recently it has adopted the more sane plan of seeking to improve its plant and service. It will be noticed in the list given that in several towns the Bell Company is represented by very few subscribers, Monrovia, Covina, Compton, Smeltzer, Fernando, Glendale, etc. The most recent Independent exchanges are those of Riverside, San Diego and Ocean Park; all are full automatic of the Strowger type. Ventura has the Kellogg system. Franchises have been asked for at Uplands and Ontario where work is expected to begin soon. The temptation to build cheaply is very great, because of the climatic conditions, absence of lightning and storms of all kinds, but the Independents, benefiting by the experience of the Bell on the Pacific Coast, brushed aside the temptation and put in the most modern equipment known to the art, the construction being the equal if not the superior of any in the East. Recently the tendency has been to abandon open work and install the cable, and this policy will be continued for all time to come. The local companies have shown remarkable energy and enthusiasm in the work and have spared neither time nor money to make the movement a grand success, not only as units, but they have worked almost as one company, the greatest possible harmony prevailing throughout, they having but one goal and one ambition, that of giving the people the very best service possible at the lowest rates consistent with successful management.

As no doubt you have observed, the various exchanges throughout Southern California are separate companies, the territory having been distributed and assigned to the various companies by the construction company. It therefore became necessary to form another company to build, operate and maintain the very necessary toll lines connecting these towns and cities with each other. This company is called the United States Long Distance Telephone & Telegraph Company, no doubt named after its parent in the East and with which in time it will probably co-operate in connecting the East with the West. This company started out in a very modest way, having only a few miles of wire in use and but one toll position of two operators and ten lines; to-day it has about 500 miles of pole line carrying from 1 to 20 circuits per pole. An idea of the extent of this system can be seen from the map. Taking Los Angeles as a center its lines reach all beach points to the West and go as far east as Redlands and Riverside; to the north the lines reach Goleta, a small town north of Santa Barbara, and on the south they extend as far as Santa Ana. This line will soon be extended as far South as San Diego and the Mexican border. This company has recently made a specialty of farmers' lines, which act as feeders for the various trunk lines. It is also encouraging the formation of small local exchange centers, so much so that its business has almost doubled itself in the past year, and three toll boards of two operators each with a two-position recording and chief desk is too small to take care of the business and enlarged quarters are now being arranged for with a larger toll board capacity. It is now building 10 new metallic lines to Pasadena and 5 new metallic circuits to Redlands, San Bernadino and Riverside, all of No. 10 E.L.S. copper. It is also arranging to increase the number of lines to Whittier and Santa Ana and way points which are now overloaded. The construction is of a very high order and nothing but copper is used throughout.

WIRING FOR SAWDUST ELEVATOR MOTOR.

BY ARTHUR B. WEEKS.

Given a 1 hp. 110 volt two-phase alternating current motor on the fourth floor of a factory, for the purpose of conveying sawdust from the ground floor to a bin on the fourth, the device to be so arranged that when the sawdust door is opened, the motor will close a switch and set the machinery in motion.

Current can be taken from the lighting mains, one from each phase, and tapped as near the motor as possible, but not to interfere with office circuits, as the flickering of lights is often very annoying. The sawdust shaft must be protected against the possibility of fire, hence the outside door must be arranged and made to close tightly, and be covered with sheet iron. The entire shaft, if exposed, must be covered on the outside with metal; the bin must be lined throughout with sheet metal, and its door treated in the same way, both outside and inside. Place the motor on a small but well constructed wall bracket, or suspend from the ceiling, according to the style provided.

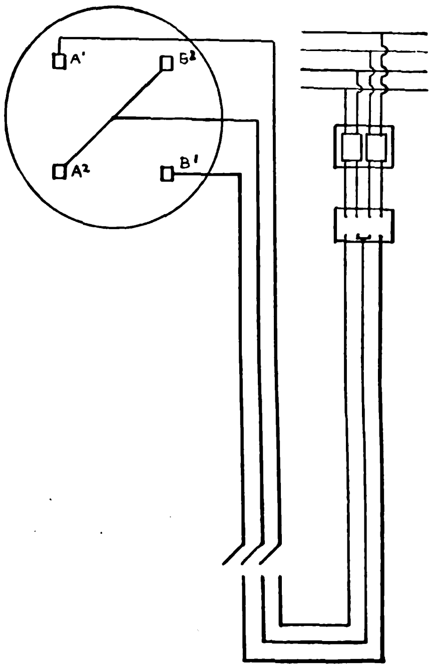


FIG. 1.

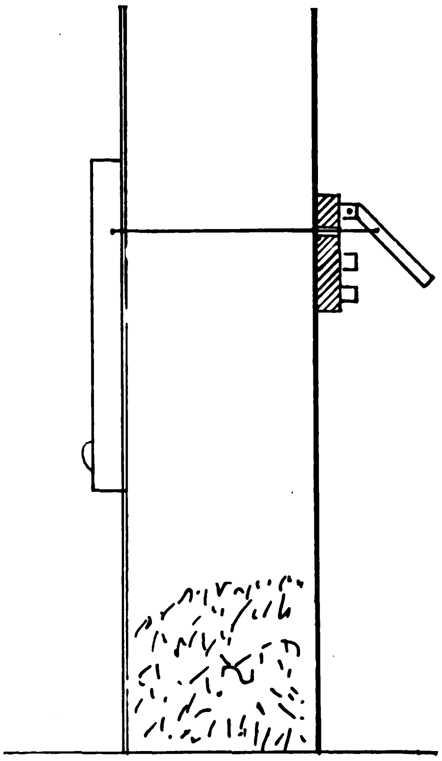

FIG. 2.

It will be observed in Fig. 1, that after leaving the switch there are but three wires employed. This means a great saving in wire and is accomplished by joining the two lower inside switch contacts with a wire, with the third or inside wire connected to this joining wire. At the motor A^2 and B^2 are connected by wire as shown, or A^1 and B^1, it makes no difference which. If on starting the motor it runs in the opposite direction from that desired, reverse the free wires A^1 and B^1, if connected, as shown in Fig. 2. This method of wiring is spoken of as changing from two-phase four wires to two-phase three wires. For so small a motor no auto-starter is required, nor is any external resistance necessary. To start, simply close the switch.

A 50 to 75 ampere two-phase single throw switch is required, together with two porcelain double pole main fuse blocks on the fourth floor. Use 25-ampere fuses. The wiring can be done in molding or conduit, preferably the latter. Use No. 10 rubber core wire.

If the elevator is only occasionally required, this small motor can be utilized for other purposes. If it is intended to operate the sawdust elevator only, the motor can be located on the floor which is most convenient as to space and accessibility.

A box elevator could also be operated by this motor, having the inclined shaft on the outside of the building, and operating by means of a friction clutch. It would be best, however, not to run both at the same time. A friction clutch could be used with the sawdust elevator shaft, or the belt can be slipped off its pulley if desired. Should both be operated at once, a fuse will be liable to blow at times, and the replacing of fuses may be annoying, if the wiring is such that several fuse blocks are required. If it was a direct current circuit, the solution would be very simple indeed; but from the fact that there must be a two-phase circuit, and that in all probability there is only a single phase feeder circuit in the block, and that it may be necessary to run a long circuit from another building, the case will be worse still if fuses blow on two or three sets of fuse blocks.

The idea should be then to eliminate all fuse blocks possible, even using wire as far as the motor, with the same size as the feeder if necessary, so that to this point no fuse blocks will be required. Then fuse at the motor, as shown in the illustration.

Hunting around with ladders for blown fuses is one of the worst nuisances imaginable. If the fuss on one phase blow, the motor will stop and cannot be started until re-fused. Flash the switch to see which phase shows no spark; or better still, connect two 110 volt lamps in series, this being a 110-volt circuit, and 220 volts across certain leads of the three-wire circuit. Testing at the upper leads at the fuse blocks will of course give but 110 volts maximum.

An electrician was once called to start a motor connected as herein illustrated, and when all the tests had been made and fuses examined and found to be intact, with no broken wires nor loose connections, it still refused to start. He made sketches of the wiring, and wondered what could possibly be wrong. Stepping into the engine room to talk it over with the engineer, he found a switch open, left so by mistake and unnoticed by anyone else. It cut off current from one phase.

When assuming charge of a new plant, one sometimes finds conditions which lead to all sorts of problems. It takes time to make changes, as well as expense. Some firms, seeing no necessity for making improvements or changes in wiring, when they are not aware that it has given trouble, veto the improvements. Electricians are therefore judged by the condition of circuits, motors, etc., sometimes when they have no control over conditions, being under the supervision, perhaps, of a master mechanic, who is not discriminating in electrical work, being purely a mechanical man. This at times accounts for conditions found in shops, and is not the fault of the electrician.

Electrically Operated Plow.

A plow operated by electricity is being constructed by a Minneapolis firm. The plow will be run by trolley on an adjustable wire, and the current will be furnished by a dynamo set up in one corner of the field.

ELECTRICITY LEAFLETS.

BY NEWTON HARRISON, E. E.

THE TRANSMISSION OF POWER.

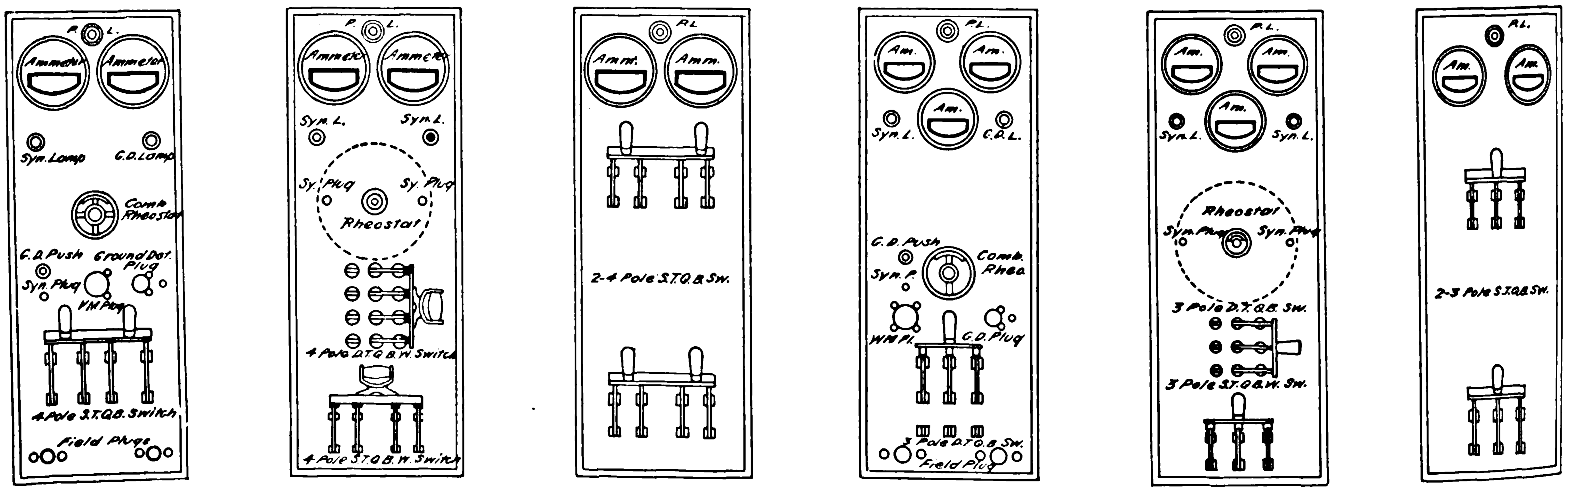
Switchboards for Polyphase Circuits.—The control of power circuits is best obtained by the use of special switchboards so designed that the apparatus necessary to exercise this control is conveniently situated for use. In order to simplify the arrangement of these various devices the switchboard is considered in an analytical manner and the apparatus attached to it classified with respect to their individual functions. It is to be noted, however, that the switchboards themselves and the apparatus they contain may be divided up into low potential switchboards and high potential switchboards.

Low Potential Switchboards.—The elements of a switchboard of this character may be regarded as consisting of the following:

PANELS OF A LOW POTENTIAL SWITCHBOARD.

1. Generator panels.
2. Feeder panels.
3. Rotary converter panels.
4. Polyphase motor panels.

The construction or manufacturing department of large concerns make panels of this character their standards. A switchboard is therefore built up of a series of parts as enumerated. They are called panels and as such are held together by means of a frame consisting of a rectangular iron support resting on ornamental legs. Clearance between the floor and the lower part of the frame of about 2 feet completes the design. The iron legs are broad and removable. In case extra panels are required, these legs may be removed and marble panels inserted mounted with whatever apparatus is necessary. Some of the panels below, in this case, will be set in blank.



No. 1. No. 2. No. 3. No. 4. No. 5. No. 6.

No. 1—Two-phase Generator Panel. No. 2—Two-phase Rotary Converter Panel. No. 3—Two-phase Feeder Panel. No. 4 Three-phase Generator Panel. No. 5—Three-phase Rotary Converter. No. 6—Three-phase Feeder Panel.

The general list of apparatus employed on the switchboard is comprised in the following schedule:

1—Indicating voltmeters.
2—Field ammeters.
3—Swinging voltmeters.
4—Switches.
5—Rheostats.
6—Synchronizer.
7—Ground detector.
8—Fuse blocks.
9—Transformers.
10—Compensators.
11—Wattmeters.

Indicating Voltmeters.—Instruments of this description are employed for the purpose of enabling the switchboard attendant to obtain the voltage of any phase of the system or of any generator by the use of a plug switch inserted into a voltmeter receptacle.

Field Ammeters.—The field of the generator carries current, the amperes of which it is desirable to know. Means are therefore employed to connect one or more ammeters into the field circuit for the purpose of determining this current when desired. The name field ammeter is sometimes given to this instrument when so utilized.

Swinging Voltmeters.—Voltmeters of this description simply swing from the side of the panel by means of an arm or bracket. When a second generator panel is installed for the purpose of operating more machines in multiple, the use of another voltmeter becomes necessary and a voltmeter is therefore installed to occupy a place beside the first in the bracket or swinging arm. A means of ready comparison is thus instituted between the two voltmeters and the pressures of each generator examined for differences. It also possesses the advantage of giving a good view of these two instruments from any point of the switchboard.

Switches.—These devices are naturally required to make and break quickly. The time in making contact and the abruptness in breaking it are matters of the greatest importance in this class of equipment. The switches are made with three and four-pole contacts, suitable as a little reflection will show, to the phases they make or break. What are called "spade handles" are provided with the four-pole switches and a handle of special construction, called by the manufacturers reinforced, for the three-pole switches.

Rheostats.—The back of the generator panel holds the rheostat. Before entering further into a brief description, it is well to state that the rheostats are of two types—one for the exciter and the other for the generator. Handwheels are employed to turn the contacts which do not appear on the face of the panel. Only a dial is seen with a movable index. This gives a relative idea of the operation of the rheostat when varied by means of the wheel handle. In some instances the rheostat is employed at a distant point from the switchboard and only the face plate with its various connections led to the panel. The generator referred to is the alternating current machine into whose field circuit the exciter feeds. Both the exciter and the alternator fields are therefore controlled by individual rheostats as described.

Synchronizers.—When two or more alternators are to be thrown into multiple it is necessary to use a device which will show when the current waves are in unison. Unless this is attended to interference will result and the lamps flicker constantly. A synchronizer is therefore employed by means of which the machines can be thrown together without risk in this respect. When the generators are run in multiple, the generator panel receives the individual currents from each machine and it is delivered through a switch to the bus bars. Every separate circuit possesses an ammeter. If there are different phases, an instrument for measuring current is also employed. If the generators are run in multiple, from each generator panel connections are made to provide them with a synchronizing lamp.

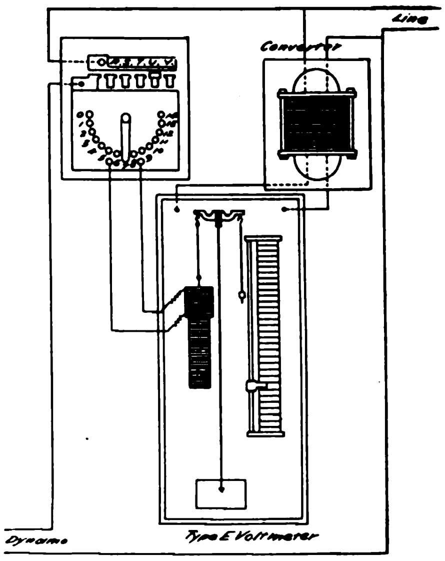
Ground Detectors and Fuse Blocks.—A ground detector is a device by means of which any leg of the circuit may be tested for grounds. The use of two lamps in series, connected to the ground at the point of connection between the two lamps, and so arranged by means of a switch that a test may be made as desired, constitutes the general character of the apparatus. Whichever lamp burns brightest indicates the position of the ground. If the lamp connected to the right hand leg burns brightest the left leg is grounded and vice versa.

Fuses for alternating current service are generally mounted on porcelain backings, which in turn are contained in an iron box. They are specially protected with regard to the lineman. When blowing the operator is protected from injury by the position they occupy in the porcelain foundation. Transformer fuses are made single or double pole. Lead wire is dispensed with for all currents over 10 amperes. Beyond this point copper is frequently employed although aluminum is also desirable. A type of porcelain tube is employed which forms part of the porcelain foundation and which occupies a front position in the forward part of the fuse block; this contains the fuse and, as previously mentioned, protects the lineman whether the box is near his hands or not, or whether it is opened or closed. In some designs of fuse blocks the porcelain tubes are readily removable. As they contain the fuse itself, it is readily evident that the removal of this tube and the insertion of another involves no risk of dangerous contact. The fuse, when blowing, expels the volatilized metal through the porcelain ends and thus protects the device from injury. It is to be understood that a fuse box must be waterproof. The presence of moisture would rapidly invite electrolytic and other actions. Heavy grounds, ultimately resulting in short circuits, would be incurred if it were otherwise. Special means in the shape of bushings are used to exclude all moisture from metal parts which might be injuriously affected.

FUSE BOX DATA.

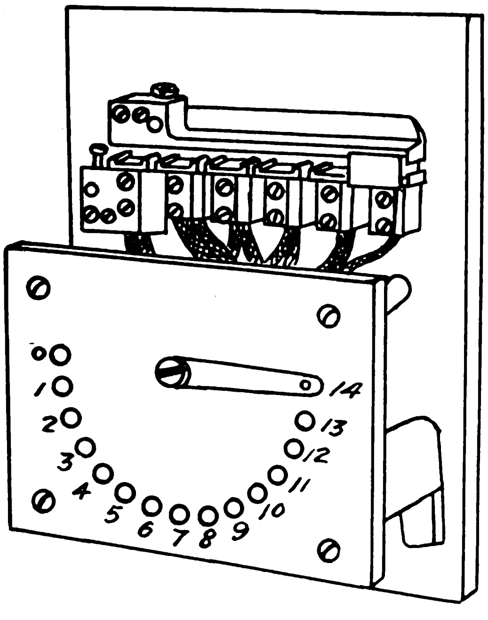
Voltage.	Maximum Current.	Information.
1,000	10	Double pole in cast-iron box.
2,000	2	
1,000	10	Double pole without box.
2,000	2	
3,000	30	Double pole in cast-iron box.
3,000	30	Double pole without box.

The Compensator.—The description of the purpose and function of the compensator is comprehensively stated in the pamphlets of manufacturers of this class of apparatus. It is inherently useful in indicating the pressure at the point at which the current is consumed. In this respect the power plant pressure is greater as can be readily understood, but the compensator fulfills the peculiar purpose of correcting the voltmeter indication of this drop between the two points. The transmission of power problem involves the sustaining of the correct pressure at the points, not only of distribution, but of consumption as well. The termini of the feeding system must therefore be watched carefully to remedy any great difference in pressure between them and the station proper. The ohmic drop is readily understood as being dependent upon the resistance and current. These, in their place, are necessarily dependent upon the dimensions of the feeders and the load they carry. With but one circuit, the problem is simple in its nature. With many, however, it represents complexities that invite the use of the device to be described. The complexities are those due to the same station or generator particularly supplying current to circuits in which conditions exist which call for independent regulation in each. One manufacturing concern argues as follows: "In some cases where the load varies over a wide range it may be advantageous to permit a considerable drop during the limited time that full load is supplied in order that the first cost of the line may be reduced. This necessitates supplying at the power station a voltage considerably higher than that required at the load. In other circuits, carrying a full load most of the time, it will be more economical to install a conductor of large current carrying capacity, at a corresponding increase in the cost, so that the percentage of drop may be kept within reasonable commercial limits. In these cases the voltage supplied at the power station will be but a few per cent. higher than that required at the load. It is evident therefore that in many cases the cost of transmission circuits can be considerably reduced providing suitable regulating devices are installed at the station. It is also important that means be provided at the power station to indicate the EMF. at the load, otherwise it is impossible for the attendant to regulate the voltage properly. The old method of accomplishing this was to run small wires, called pressure wires, from the end of the circuit back to the station, these wires being large enough to carry a sufficient current for the voltmeter without an appreciable loss. This method was quite expensive and if carried out to any degree of completeness resulted in a great deal of complication. It is evident that the cost of installing pressure wires is prohibitive when the feeders cover the great distances which are now common in lighting and transmission plants. A simple, inexpensive and thoroughly effective method of accomplishing the same result is afforded by the compensator."



Connections of the Compensator Converter and Voltmeter.

Compensators are made of two types, one to serve in compensating for ohmic drop only and the other to compensate for both ohmic and inductive drop. The attendant in charge of the ohmic drop compensator can readily adjust the pressure until the candle power of distant lamps is normal, irrespective of the intervening drop. Wattmeters and transformers have received attention in the preliminary treatment of this subject. The compensator is a transformer, according to the description given by one manufacturer, the primary of which is connected in series with the supply circuit. The number of turns in the primary coil of this device are capable of variation. They may be adjusted and the same is true of the secondary; but the secondary is connected to a volt meter. The result of this system is as follows: "As the load on the circuit increases, current through the primary increases, and the action of the secondary current on the voltmeter increases. In some types of compensators the secondary is connected in series with the voltmeter circuit. The secondary of certain standard types is connected to an auxiliary coil wound around the voltmeter solenoid. The action is similar to that of the series coil on a compound wound generator. The current from the compensator is opposed to the current in the solenoid and as the action of the auxiliary coil increases, the current through the main solenoid must be increased in order to give the same resultant pull on the core. This requires a higher pressure on the voltmeter itself, and consequently an increased pressure on the circuit. The amount of compensation depends upon the number of turns in the auxiliary coil."



Compensator with Adjusting Arm and Contacts—Four-Hand Regulation.

In the illustration the connections are shown, including the R, S, T, U, V plug contacts and the auxiliary coil around the voltmeter solenoid. The adjustment of the secondary is also shown where the numbers 0, 1, 2, 3, 4, 5, 6, 7, 8, 9, 10, 11, 12, 13, 14 are visible. This last governs the current in the auxiliary coil around the voltmeter solenoid. Compensators are made for an amperage of 160 or less and a frequency of from 16,000 to 7,200 alternations.

In more highly developed types, irrespective of the nature of the load, the current, power factor, reactance and resistance are all taken into account. Special adjustment is made in allowing for ohmic and inductive resistance when compensators are installed.

THE ORGANIZATION OF WORKING FORCES IN LARGE POWER HOUSES.*

BY W. P. HANCOCK.

The electrical portion of the organization of a power-house is divided into six parts, the most important of which are:

First—A uniform pressure at the feeder terminals throughout the entire system.

Second—The proper and economical loading of machinery under the charge of the division; and,

Third—We hold this division responsible for the welfare of all electrical machinery, which must be, as far as possible, always ready for operation.

I may say that all repairs, except minor ones, in the division are done by outside parties. With the modern stations of to-day operating lighting and stationary motors and other low-tension apparatus, at the same time delivering alternating current to sub-stations, there is involved a vast amount of apparatus, due to the fact that we must have as much flexibility as possible. We must also have several ways of attaining the same object, as to the delivery of current, in order to safeguard our customers against interruption of service and, incidentally, preserve our reputation for being a reliable concern to deal with. It follows then that we need in a chief operator a man who is absolutely reliable, preferably one who has come up from the ranks and has long since become acquainted with the practical side of operation; one who realizes and instills into the minds of his assistant and men that one of their most important duties is so to manipulate the load with reference to machines to be operated that all units will be loaded to just as near the most economical operating point as it is possible to have them under the existing conditions. He must at all times be in close touch with the chief engineer, and as far as possible, give the steam division advance notice of his probable demand for steam units, thereby giving everybody a chance to be ready, and giving the customer the opportunity to verify our claim that we are at all times ready to supply current. Above all other things, he must have and use good judgment in the selection of his men and the treatment of them, and must conduct his division in a manner that will not only produce satisfactory service, but will be conducive to contentment among his men and will secure for himself their confidence and respect, which once secured and properly held will be a large factor in maintaining what is as nearly as possible ideal operation.

He should always follow the system of hiring new men at the lower end of the line, and moving those who have acquired a degree of proficiency along to a proper position in accordance with such proficiency, thereby giving them the encourment of understanding that the greater their proficiency the more valuable their services will become to the company, up to a certain limit in that line of work.

ASSISTANT OPERATOR.

The assistant to the chief operator must be a man who can assist his superior, and to that end he must be thoroughly familiar with all of the electrical apparatus in the division. He must be able to occupy the position of the chief operator when necessary; in fact, he must be a first-class understudy, and must realize the fact, too, or he will lose to some degree the sense of his responsibility. He should circulate among the sub-stations and correct and report any irregularity noticed in machines or operators; in fact, he should keep his superior constantly in touch with such details as do not come immediately under the notice of the chief operator, and in cases of emergency should come at once to the station and be ready to assist if needed.

The assistant should also be extremely careful about the placing of his orders with the men, and in matters outside of absolute routine place no orders without the consent of his superior; many mistakes are avoided if every one concerned is conversant with what is to be done, and with our means of communication in these days, not much time need be lost in giving notice.

WATCH OPERATOR.

The heads of watches should be, and necessarily are, men who have come up the line and who understand all the electrical combinations that can be made with machines, switches and lines throughout the system; if they are not, they should not occupy that position, nor should they in any case until we know by actual experience that they have the ability described above.

To these men we accord the highest wages paid in the division, with the exception of those of the chief operator and his assistant, and we make them uniform in all power stations of the system. By this method of making men fit the position before they occupy it, we secure the ability we desire, and after it has been proven beyond doubt by a previous practical experience. It is, in my opinion, a serious mistake to class men alike for the sole reason that they have worked practically side by side on the system for a period of time. I say, pay the man in accordance with what he can deliver to you in brains or manual labor equivalent. I admit that the man who can not deliver the first-named portion of a working man's capital, and won't deliver the last item, may conclude to get off the pay roll and identify himself with some organization or other which may demand that all of its members receive the same wages. If he does this, it is his affair; but we can not afford to pay the same price for ignorance and neglect that we can for ability, aided by push and a desire for further knowledge. In making this statement I do not mean to cast any reflection on a man that may have less ability than others, but instead to speak from a purely business point of view, and I repeat, that the chief operator when hiring men should be particular to move along the best ones, and be still more particular when he takes in his green workmen to observe to the best of his ability, and satisfy himself thereby, of the apparent future value of the men. This is the proper method to adopt in order to keep the organization up to standard; that is to say, it is the proper beginning, and let it extend down to the end of the line, even to the cleaners, for there are good cleaners and bad ones, especially on electrical machinery.

---

*Abstract of paper read before the National Electric Light Association at its 28th convention, held at Denver-Colorado Springs, Col., June 6-11., 1905.

STORAGE-BATTERY DIVISION.

Of the organization to operate storage batteries, I will say I believe that the cheapest man to have at the head is one who is both technical and practical in that line of work, and that he should be possessed of the same qualifications as are necessary in other heads of divisions with reference to handling men; but there is this to add, that it is seldom that men will work in the general line of storage-battery repairs for any considerable length of time, in that such work is not of the sort that attracts the average man, and they do not stay long enough to actually show of what value they might be after a reasonable period of service.

HEAD OF DEPARTMENT.

I have refrained from speaking of the head of the generating system and the assistant to that person, for the reason that it seemed to me proper to look over what there was in the nature of organization and operation that the head and his assistant were called upon to look after. I now say that the head of the department has responsibilities as follows:

First—The very important one of the organization of his department. If that be correct, or as nearly so as conditions will permit, the operating responsibility, broadly speaking, will not seem as serious to the head of the department as it would under the more unfavorable condition of lax discipline in the handling of heads of divisions and men who have severally decided that the head of the department is in his position for the sole purpose of bearing his title instead of directing the operation of the generating system. He should not only pass his orders on operation to his assistant, but in addition should see to it that they are carried out. He should carefully observe the result, and be ready to devise, if possible, methods of saving to his several accounts, as the total of these will represent his total generating cost. He should not, however, overdo the looking after of small details, for several reasons. First, because he has an assistant and several heads of divisions, who occupy positions and are paid salaries for the purpose of looking out for that portion of the business, and if they don't do it and relieve him in that direction, then either the organization or the discipline or both are not corrrect, and it is absolutely useless for him to expect to proceed on a successful basis until his own error, whether caused by neglect or otherwise, is corrected, and his people understand in a thorough manner that the head of the department is there to direct its operation.

The head of the department should also keep in touch with the intentions of his heads of divisions relative to their hiring of men, and not only confer with them in a general way on such matters, but lay down a rule that men connected in any way with matters detrimental to the interests of the corporation should not be hired in any event. He should include in such a rule a stipulation that if men of such type can get inside the organization notwithstanding proper precaution has been taken, they should be relieved from further connection with the department at once and be replaced by men of a different class.

I have found by some years of experience that to pay one line of work a standard wage, whether it be lower or higher than the so-called "union" scale, is productive of more contentment and better sentiment toward the employer than anything else I know of, but in order to do this consistently we must, as I have mentioned before, be careful to select a class of men who are very nearly alike with reference to the amount and quality of work which they can perform. Such a thing can be done easily, as I know by actual experience.

It does not seem necessary to say that the head of the department should not absent himself from the system or from his office for any length of time without giving notice where he can be found in case of emergency, and the assistant and heads of divisions should be required to observe the same rule; for while such a rule may seem to be somewhat of a hardship at first, on second thought we can easily imagine cases where it would be most unfortunate not to be able to avail oneself of the services of one of the best men in his department just because one is unable to locate him; and besides, such a rule removes any chance of inference being drawn which might be detrimental to the man.

The head of the department has at times to go farther than his office to get at the reason of the rise in some account which seems abnormal. He must, after exhausting other methods, simply get in and dig it out; get the reason, and see if it is a proper one, and if not, apply the remedy. If the reason is proper he is entitled to rest content, because he has assured himself that the rise in the account is not the result of reckless expenditure; if he finds a poor reason, he will strengthen his organization by taking the matter up with the proper party and going into it in a manner that cannot be misunderstood, and show where it is to the advantage of all concerned to make that expense nearer the proper amount.

It sometimes happens that difficulty occurs between some of the men and their superior, in which the man from the ranks feels that he has been misused; that his superior has been too hard on him because his advantage of position has given him the privilege. In such cases, after the man has taken his trouble to the chief of his division and even then feels that he has a grievance, I believe it to be good policy to allow him to see the head of the department as a last resort; for the head to call in all parties concerned at one time and hear the several stories, one at a time, and decide the matter. Of course, if the superior has used his position properly there can be but one result; if he has not, and you have to decide the man is not to blame, then be sure you have that man understand beyond a doubt that he can not and must not mistake a just decision for a license to disobey in the future, but that he is bound to work for and obey the same superior, just as much as he was previous to the time when the difficulty ocurred.

It therefore seems that there are a good many places where the head of the department can put in his services and benefit the organization, and if he can find the necessary time to walk out and through his system, even though he does not speak at all, no doubt he can see spots that will bear criticism, and it is for him to note them and, as I said before, "apply the remedy."

For the head of a department to say to himself, "We are now organized and operating satisfactorily, there is nothing more in that line at present," is a rash statement even to himself, as he will soon find out if he does not watch what he has tried to put together so carefully. To watch the organization, and constantly, too, is what is in a large degree necessary to the attainment of a low cost per kilowatt-hour.

WRINKLES.*

EDITED BY H. C. ABELL.

Booster Transformer.

We have used a transformer for a booster, as shown in illustration, and while to many it is not new, yet it is so to some central stations. The transformer must be large enough to carry the main line current in section coils. We wanted a 5 per cent. boost on a line temporarily and found this one way to obtain the results. H. E. RYDER.

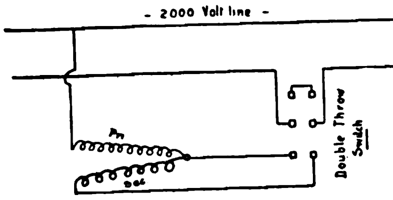


DIAGRAM OF CONNECTIONS.

Direct Current Power Machines at Sub-station Driven by Synchronous Motor.

These power machines feed into the same lines as the engine-driven power machines at the main station. The motor-driven power machines are used as motors, taking current from the main station to bring the synchronous motor to speed at starting.

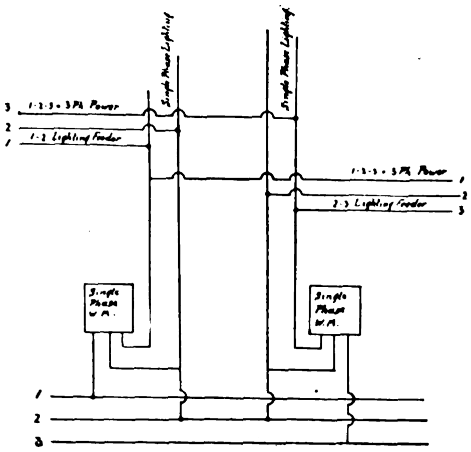
The motor current in the series field winding of the machines overpowers the shunt winding, so that the machines refuse to start and produce practically a short circuit upon the lines, opening circuit breakers, etc. Switches were placed upon the machines for reversing the connections of the series winding at starting. After the motor is synchronized and the power machines loaded the series coils are cut out by means of a single-pole switch, while the reversing switch is thrown over to give the proper compounding effect.

It is often desired to run this apparatus through short periods of small loads rather than shut down and start over. When the load drops as low as one-quarter full-load equilibrium becomes unstable, due to the absence of an equalizer, the load all being taken by the main station. Worse than this the power machines begin taking current from the lines and supply energy to the alternating current lines through the synchronous machine. The increasing motor current in the series winding of the power machines overpowers the shunt winding, causing the torque to pass through zero and reverse, coming up so high as to pull the alternator out of synchronism. The remedy for all this is, of course, to throw the reversing switch to the starting position when the load is small, making proper voltage adjustment by the shunt field. The equilibrium is then stable.
J. M. WEED, Denver, Col.

Taking Three-Phase Power from Two Single-Phase Lighting Feeders.

The accompanying diagram shows a scheme for taking three-phase power from two single-phase lighting feeders when these feeders are tapped, as shown, on all three 'bus bars by simply running one extra wire to the point where the motor is located.

You will note that the three-phase power is recorded by two single-phase wattmeters, at the same time taking care of the single-phase lighting load, whatever it may be. The potential, current and static transformers are purposely left out of the diagram, to avoid complication, our 'bus bars being 2,300-volt, three-phase. We give C.R. voltage regulators in each single-phase circuit and can therefore keep the lighting voltage anywhere we want it. We use this scheme on one single-phase lighting feeder that runs two miles to the outskirts of town, along which are many lighting consumers. We simply run one extra wire, tapping it off the current meter side of the other single-phase feeder. AUSTIN BURT, Waterloo, Ia.



WIRING DIAGRAMS.

Exciter for Synchronous Motor.

This company recently installed a 400-kw. synchronous motor at one of its stations, to be used both as a feeder regulator and to drive two direct current machines belted to it. Its operation was very unsatisfactory, as the incandescent feeders, operated from the same 'bus bars, gave a very noticeable flickering of the lamps, the voltage varying constantly two volts either way from an average.

We thought the trouble due to the fact that the exciter was run from the synchronous motor shaft, and accordingly belted it to a separate motor run from a separate feed. This has obviated all fluctuations and the entire set is now giving satisfaction. C. F. HAYWOOD,
Denver, Col.

Apprentices in the Electrical Trade.

Beginners in the electrical trade are wanted by the General Electric Company at its factory in West Lynn, Mass., and the company announces the following rate of wages: To graduates of high schools only—drawing office apprenticeship course, $5.33 per week for first six months, $6.30 per week for second six months, $7.28 per week for third six months, $8.25 per week for fourth six months, $9.22 per week for fifth six months, $10.67 per week for sixth six months. There will also be a bonus of $75 distributed if the three years of service have been satisfactory. Shop apprenticeship course, $4.48 per week for first six months, $5.60 per week for second six months, $5.72 per week for second year, $7.84 per week for third year, $9.24 for fourth year; bonus of $100 at expiration of term if services have been satisfactory. For high school students and grammar school graduates—shop apprenticeship course—$3.36 per week for first six months, $4.48 per week for second six months, $5.60 per week for second year, $7 per week for third year, $8.40 per week for fourth year; bonus of $100 at expiration of term if services are satisfactory.

Electrical Contractors' Convention.

The National Electrical Contractors' Convention at Boston last week was attended by 175 delegates. The proceedings were conducted with closed doors.

---

*Paper presented before the National Electric Light Association at its 28th convention, held at Denver-Colorado Springs, Col., June 6-11 1905.

Automobile Dealers Incorporated.

The National Association of Automobile Dealers, to promote and advance the mutual interests and welfare of its members and to harmonize their relations, was incorporated at Albany, N. Y., on Monday. The association is to have its principal office in Buffalo.

Exhibit of Traction Supplies.

The south pavilion of the Commercial Museum has been secured by the American Street Railway Manufacturers' Association for an exhibit to be given in connection with the annual meeting of the American Street Railway Association, to be held in Philadelphia, Pa., September 25-30, inclusive. Secretary George Keegan, of the latter association, has issued a circular letter advising all intending exhibitors that another large building will be available in the event of the south pavilion being filled. More than 75,000 square feet of floor room will be offered for use and two railroad tracks, more than 1,000 feet long, will be constructed for outdoor exhibition purposes.

Out-of-Door Electric Signs.

A recent visit to the West proved to the writer that the merchants and manufacturers realized the value of electrical display signs. In many cities nearly every business house had its electric sign, and this means of advertising has proved so valuable that it is finding a ready welcome in the East.

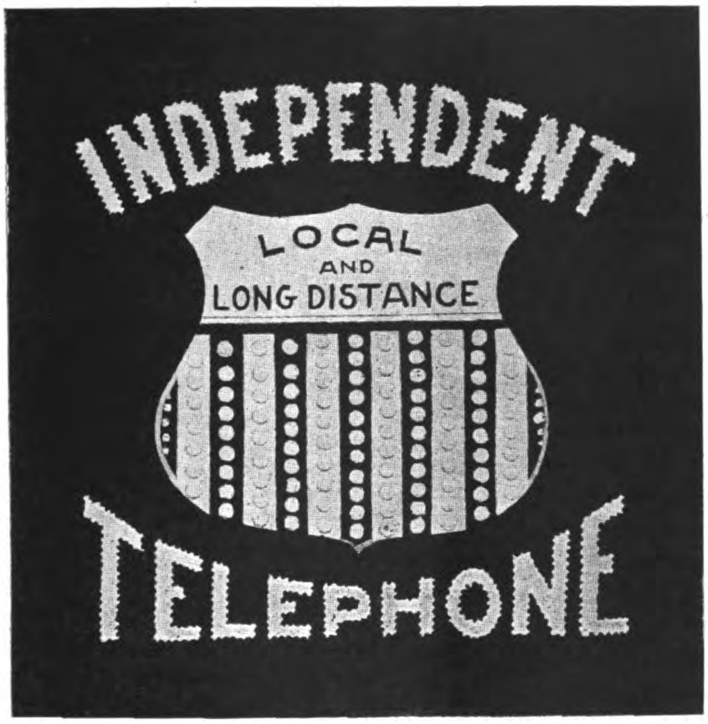
Nothing contributes more to the attractiveness of a business street or place of business than a harmonious electrical display, and the American Electric Sign Company, 41-45 West Van Buren street, Chicago, has forced itself to the front as a leader in this style of advertising. Its enterprising manager, Mr. H. C. Dodge, has pushed the electrical sign method of advertising so extensively in the West that he has nearly covered the entire field and he is now turning his attention to the East.

These signs combine lightness of weight, strength and durability; are easily handled, easily hung and adapted to be safely shipped to distant points; are lighted from the interior, and cost of current required to produce effective illumination is moderate.

All that is necessary in ordering a sign is to state the voltage of the incandescent lamps you burn. Signs are ordinarily provided with 110 volt lamps with Edison style of base attachment plug on end of connecting cord for Edison socket, and the flasher adjusted for use with current of 110 volts pressure.

The American Electric Sign Company assures us that the signs are attractive in the daylight when not illuminated, but that when the flasher is in operation, it conveys a suitable impression of the attractive prismatic blending of colors which illuminates the lettering and various designs on the slides through the medium of the electric light.

The company will be pleased to send you illustrated circulars describing the flashlight and outdoor electric signs, and the illustration herewith shows the appearance of the signs, minus the coloring.



ELECTRICAL PATENT RECORD.

LETTERS PATENT ISSUED JULY 18, 1905.

Electric Railways and Appliances.

794,784. Block-Signaling System. Harry M. Coulter, Chicago, Ill. Filed Sept. 5, 1903.

795,016. Trolley-Ear. Montraville M. Wood, Schenectady, N. Y., assignor to the General Electric Company. Filed Jan. 15, 1902.

795,243. Railway-Brake Apparatus. Granville T. Woods and Lyates Woods, New York City, assignors to the Westinghouse Electric & Manufacturing Company. Original application filed Dec. 31, 1902. Divided and this application filed April 10, 1903.

Electric Lights and Appliances.

794,839. Electric-Arc Lamp. Malcolm H. Baker, New York City, and Samuel P. Wilbur, Wilkinsburg, Pa., assignors to the Westinghouse Electric & Manufacturing Company. Filed Jan. 10, 1903.

794,902. Arc-Light Electrode. Friedrich O. Vogel, Berlin, Germany. Filed July 6, 1903.

794,924. Application of Electric Lights to Revolvers or other Firearms. Eugene C. I. Caillìez, Lens, France. Filed Jan. 6, 1904.

Electrical Machinery and Apparatus.

794,742. Soldering-Nipple for Electric Cables. Henry E. Procunier, Oak Park, Ill. Filed July 22, 1903.

794,820. Automatic Rheostat. Carson J. Sturgeon, Erie, Pa., assignor to the Federal Electric Company, same place. Filed Feb. 4, 1904.

794,886. Support for Dynamos. Willard F. Richards, Buffalo, N. Y., assignor to the Gould Coupler Company, New York City. Filed Sept. 27, 1904.

794,935. Electric Switch. Monroe Guett, Hartford, Conn., assignor to the Hart & Hegeman Manufacturing Company, same place. Filed Nov. 1, 1904.

794,995. Alternating-Current Motor. Maurice Milch, Schenectady, N. Y., assignor to the General Electric Company. Filed Dec. 21, 1903.

794,998. Dynamo-Electric Machine. Frederick A. Mott, Erie, Pa. Filed Nov. 27, 1903.

795,000. Motor-Control System. William O. Mundy, St. Louis, Mo., asssignor to the General Electric Company. Filed Feb. 20, 1903.

795,024. Pneumatic System of Motor Control. Frank E. Case, Schenectady, N. Y., assignor to the General Electric Company. Filed Dec. 5, 1902.

795,077. Power-Transmission Gear. Erick J. Swedlund, Atwater, Minn. Filed April 10, 1905.

795,170. Electric Brake. William G. Price, Pittsburg, Pa. Filed Aug. 17, 1904.

795,235. Electrical Switch and Operating Mechanism Therefor. Willard F. Richards, Buffalo, and William A. Turbayne, Lancaster, N. Y., assignors to Charles M. Gould, New York City. Filed April 9, 1904.

795,247. Current-Collecting Shoe. William M. Brown, Johnstown, Pa., assignor to the Lorain Steel Company. Filed Jan. 26, 1903.

795,256. Method of Operating Multistage-Turbines. Austin R. Dodge, Schenectady, N. Y., assignor to the General Electric Company. Original application filed Nov. 7, 1902. Divided and this application filed Jan 23, 1904.

Telephones and Telephone Apparatus.

794,790. Intercommunicating Telephone System. Albert S. De Veau, New York City, and Charles Auth, Brooklyn, N. Y. Filed Sept. 2, 1902.

794,967. Telephone-Support. Edward P. Baird, Evanston, Ill., assignor to the Baird Manufacturing Company, Chicago, Ill. Filed Dec. 19, 1904.

795,072. Cut-Out for Telephones. Martin L. Smith, Rutledge, Mo., assignor of one-half to Sherman C. Forguer, same place. Filed June 7, 1904.

Miscellaneous.

794,768. Electrically-Operated Keeper-Plate for Door-Locks. August Arens and Ernest L. Teich, New Britain, Conn., assignors to to P. & F. Corbin, same place. Filed Feb. 30, 1905.

794,788. Shield and Support for X-Ray Tubes. Levitt E. Custer, Dayton, and David H. Allen, Miamisburg, O.; said Custer assignor to said Allen. Filed April 6, 1903.

794,864. Electric Battery. Pierre J. Kamperdyk, New York City. Filed April 2, 1904.

795,182. Protective System for Parallel Lines. Leonard Wilson, Pittsfield, Mass., assignor to the Stanley Electric Manufacturing Company, same place. Filed Nov. 20, 1903.

795,201. Electrically-Heated Handhold. Fred S. Davis Robertsville, S. C. Filed Dec. 29, 1904.

THE TELEPHONE WORLD.

New Entry in Telephone Field.

Articles of incorporation of the Atlantic Telephone Company, with a capital of $5,000,000, were filed with the county clerk in Kings County, N. Y., last week. All the stock is common stock, each share being of $100. The objects of the company, as stated in the papers, are to furnish telephone, telegraph, telautograph and other means of electrical communication and messenger service in the cities of Buffalo, Syracuse, Rochester, Albany, New York and other cities on the Atlantic coast.

The incorporators are William H. Stayton, Yonkers; James A. L. Campbell, Charles B. Reid and James G. Shaw, of New York City; George H. Newman, Brooklyn, and Warren L. Sawyer, Nyack.

One of the incorporators recently said that he had every reason to believe the company would be sending messages in a short time.

Telephones on barber chairs are the latest innovation in Paterson, N. J., and so popular is the plan that before long it is expected other barbers in that city will have telephones installed. The barber in charge says that he put in the telephones as an experiment, and he has been congratulated by several of his customers, who are unanimous in their opinion that, while the plan is a novel one, it is soon to become popular in other places.

The management of the Keystone Telephone Company of Philadelphia has been reorganized with N. P. Folwell, president. There are seven new directors, only three of the old board being retained. A board of voting trustees with George Burnham, Jr., chairman, is organized for seven years. By the recent sale of $4,000,000 bonds to Fisk & Robinson, the company is free of debt, has $750,000 cash in the treasury and is free to make some desired extensions.

The People's Division of the Consolidated Telephone Company, of Pennsylvania, has secured possession of rural telephone lines touching Lake Winola, Newtown and Ransom Townships, Nicholson, Factoryville and Tunkhannock. These lines give the People's Company direct communication with the entire farming section of Northeastern Pennsylvania.

There are said to be nearly 50 different rural telephone lines in Crawford County, Kan., owned by farmers. Of these 28 center in McCune and six in Girard.

The Comfrey, Minn., Rural Telephone Company has its local exchange and rural lines nearly completed. The officers of this company are J. A. Prim, president; C. L. Tindersmith, vice-president; Oscar Erickson, treasurer The company will start out with about 75 'phones.

The Farmers & Merchants' Telephone Company, of Harlan County, Neb., is rebuilding its exchanges at Alma, Stamford, Republican City and Orleans and when remodeled and the cable installed, it will have one of the best systems in the southwestern part of that State.

The Quinton, I. T., Telephone Company plans to have its exchange in operation August 1.

To Sell Telephone Company.

Trustees Kinthard and Atkinson, on an order of the Court of Common Pleas, of Bucks County, Pa., will sell at public sale the entire equipment of the Standard Telephone & Telegraph Company on August 12. The upset price fixed by the court is $24,000. The property inincludes three pieces of real estate in Doylestown, Newtown and Bristol.

Successful results have been secured by the profit sharing plan of the Cuyahoga Telephone Company, of Cleveland, O. The distribution is made each six months, based on the earnings of the company for the half year period preceding. The plan was introduced for the purpose of inducing the employes to remain permanently with the company, President Dickson arguing, that a force well organized and experienced, was worth a great deal more to the company than a force where changes were continually made. The amount to be distributed will be in excess of $8,000, and will be about one-third larger than any previous distribution. The former distributions have been amounts about equal to 6 or 7 per cent. increase in salary. There will be more than 9 per cent. distributed in a short time. The distribution includes all of the employes in the various departments who have been with the company the full six months, from the office boy to superintendent.

The board of public works of Marion, Ind., has been presented with a petition for a franchise for the constructing of a continuation of the Converse Telephone Company's lines in that city. The board has taken the matter under advisement. The Converse Company is an Independent company which recently lost its connection with the United Company. Its lines extend from Converse as far west as Greentown and Kokomo.

The Fox River Valley Telephone Company, of Appleton, Wis., and the Valley Telephone & Telegraph Company, of Green Bay, Wis., have consolidated. Representatives present at the meeting when the consolidation took place state that the toll lines connecting all cities of the Fox River Valley and 45 other points in the eastern and northern parts of the State, with local exchanges at all points, will be in operation under one management by August 1.

A meeting of the Independent telephone men will soon be held at Ottawa, where they will have a hearing with the Canadian Government looking to the substitution of the Independent and probably Government owned lines there in opposition to the Bell interests in the Dominion.

The Volney Telephone Company, of Oswego County, N. Y., has been incorporated to operate a telephone system between Fulton and Volney. The directors are E. B. Tice, James Vant, J. S. Moss, Robert Simpson, Jr., Eugene Rowe, E. T. Hart and C. E. Sackett, of Volney.

With a capitalization of $20,000 the Weedsport, N. Y., Telephone Company has been incorporated by C. S. Caywood, N. F. Durston and George R. Nash, all of Weedsport.

The Springville, N. Y., Telephone Company has signed a contract with the Inter-Ocean Telephone & Telegraph Company for its long-distance telephone connections. This places the Springville company in the ranks of the Independents and affords it the advantages of excellent service. The Inter-Ocean's lines connect it directly with the Frontier Telephone Company of Buffalo, and with over 75,000 Independent telephone subscribers in Western New York.

A certificate of increase in the capital stock was lately filed at the county clerk's office by the Wayne-Monroe, N. Y., Telephone Company. At a meeting held in Williamson, the capital stock was raised from $100,000 to $200,000, divided into 1,000 shares of $100 each. At the meeting J. Seldon Brandt, of Ontario, was elected chairman, and Judson L. Transue, of Williamson, secretary.

In response to repeated demands from the Business Men's Association of Flushing, N. Y., the New York & New Jersey Telephone Company has promised to put all of its trunk lines and as many of the other lines as possible in conduits underground.

The Alachua, Fla., Telephone Company will soon commence the erection of the poles for a system for the town of Alachua, and will also handle a line to Gainesville and other points.

R. W. Wood has been appointed general manager of the Columbus, Ga., Automatic Telephone Company, succeeding A. G. Conoley, resigned.

A new telephone company has been organized at Faith, N. C., by H. C. Farmer, L. A. Raney, A. B. Goodman, J. H. Lyerley and J. B. McCombs.

The Wabash Valley Telephone Company of Effingham, Ill., will install a new plant, expending in the neighborhood of $16,000.

M. Durham will on August 1 succeed Mack Nelson as manager of the Independent Telephone Company, of Belton, Tex.

A new company, capitalized at $5,000, has been formed in Berwinsdale, Pa., known as the Clearfield & Cambria Telephone Company.

The Independent Telephone Company is putting in a new country line near Centropolis, Kan.

Over 350 new names appear in the new directory of the Iowa Telephone Company of Dubuque.

The Independent Telephone Company of Topeka, Kan., is installing new switchboards.

Telephone Incorporations.

The Commonwealth Telephone Company, Brooklyn, N. Y. Capital stock, $200,000. Incorporators: Edwin M. Brooks, Daniel Buhre, Brooklyn; John A. Crawford, Montclair, N J., and others.

The United Pay Station Telephone Company, Jersey City, N.J. Capital stock, $50,000. Incorporators: H. O. Coughlan, Thomas F. Barrett and J. W. Woods.

GENERAL ELECTRICAL NEWS.

LIGHTING.

Alma, Kan.—The mayor and councilmen lately granted an electric light franchise to the Alma Light & Power Company, which is composed of W. B. Wilson, G. A. Mueller and others.

Creston, Ia.—The Creston Mutual Electric Light, Heat & Power Company has been incorporated with a capital stock of $50,000 by John Huckott and others.

Delta, Pa.—The plant of the Delta Electric Light Company, located along Muddy Creek, about two miles from here, has been purchased by the York, Furnace, Pequa & Lancaster Trolley Company. The purchase was made for the purpose of furnishing power for the proposed new trolley extension into York County.

Ephraim, Utah.—This city is to have its own electric light plant, and bonds for that purpose to the sum of $15,000 have been issued.

Glen Ridge, N. J.—The question of electric lights is being agitated here.

Homer, Ill.—The Homer Electric Light Company is considering a proposition to furnish lights in Fairmount.

Kenton, O.—The Kerlin Brothers Company, of Toledo, has purchased the plant of the Kenton Gas & Electric Light Company of this city.

Laramie, Wyo.—Alfred E. Kalter, of Indianapolis, has been granted a franchise to erect an electric light and power plant in this city.

Livingston, Mont.—J. E. Swindlehurst and Alexander Livingston have petitioned the city council for electric light franchises.

Magnolia, Miss.—The city has granted a franchise to J. H. Price, C. V. Ratcliffe and L. E. Schilling, to erect and operate an electric light and power plant.

Marianna, Fla.—At a recent election held here it was decided to bond this town to make certain improvements, among which was electric lights.

Mancelona, Mich.—The building and fixtures of the electric light plant lately burned to the ground. The loss is estimated at $5,000.

Menardville, Tex.—A company composed of local men has been organized here for the purpose of ginning, milling and electric lights, with a capital of $12,500. D. G. Benchoof, a merchant of this place, is president of the association, which will be incorporated under the name of the Citizens' Gin & Milling Company.

Oak Grove, Mich.—Steps have been taken for the erection of a power house and electric light plant here. It is expected that the building will be erected this season. W. G. Vinton has been appointed president, and William L. Smith vice-president, Dr. Burr, secretary, W. O. Smith, treasurer of the company formed to carry out the scheme.

Roswell, N. M.—This city will have a second electric light plant if the board of city aldermen grants the franchise asked by George F. Blashek, of this city. He asks for a 30 year franchise and guarantees that he will furnish lighting power at one-half the rate that is now being charged.

St. Louis, Mo.—The Retail Merchants' Association has decided to organize a company for the construction of another gas and electric plant in Bellville. President Fellner is to appoint a committee.

Tawas City, Mich.—The Thorne Electric Company has closed a contract with this city to install a complete municipal electric light plant.

Towner, N. D.—This place may secure an electric light plant.

Wamego, Kan.—A proposition is before the citizens to vote $9,000 for an electric light plant.

Walla Walla, Wash.—C. M. Maxwell and H. Day Hanford, of Seattle, have applied to the city council for a franchise for 25 years to establish and maintain an electric light and gas plant in this city.

Waverly, Pa.—By the bursting of a fly-wheel the borough lighting plant here was recently destroyed. The engines and dynamos were rendered useless. The loss is $50,000.

STREET RAILWAYS.

Bay City, Mich.—The city council has given a franchise to the old Bay City & Cairo Traction Company, which will build a second electric line from here to Saginaw.

Brooklyn, O.—A large number of property owners in Brooklyn, Parma and Middleburg Townships attended the meeting of the county commissioners lately, to advocate the granting of a franchise through their townships for an electric line. C. H. Hubbell has been securing their consents and is asking for the franchise.

Cohocton, N. Y.—It is believed that work will shortly be commenced on the electric railroad between Atlanta and Naples, for which a survey has lately been completed New York capitalists, who are represented by George H. Switzer, are behind the project, and the matter will now be carried before the State Railroad Commission.

Council Bluffs, Ia.—The promoters of the proposed electric line from this city to Griswold have organized temporarily with H. H. Van Brunt as president.

Hagerstown, Md.—The survey for the proposed electric railway to be constructed between this city and Waynesboro has been completed. Application will be made by the projector for the right to enter Waynesboro, and as soon as this is arranged work will be commenced on the road.

Iola, Kan.—The city council has granted a franchise to the Kansas Southern Electric Railroad Company to use the streets of this city.

Marion, O.—It is understood that the Columbus, Delaware & Marion Electric Railway is included in the Widener-Elkins consolidation of Ohio and Indiana trolley lines.

Monticello, Ia.—A movement is on foot by the business men of this city for the construction of an electric line from here to Davenport.

Nashville, Ind.—The town board has granted a franchise to the Ohio Valley Traction Company. The county commissioners will meet and give the company the right of way through Brown County.

New York City.—To make the change necessary to run its trains by electric power to the Grand Central Station, the New York, New Haven & Hartford Railroad Company is laying out a new terminal yard at Woodlawn. All the express and local trains will be run into the yard there and electric motors will haul them to 42d street at a rapid rate of speed. Between Woodlawn and Mount Vernon the double-track system is now being changed into a four-track line, so that a new rapid transit system will be instituted between that city and Manhattan to compete with the Harlem road.

Richmond, Va.—The Corporation Commission has chartered the Washington & Virginia Transit Company with a capital stock of $400,000. The president of the company is M. E. Church, of Falls Church, Va. Others interested in the company are Messrs. W. C. Pennywit, M. C. Mitchell, John B. Henderson, Jr , and Charles A. Kolb, of Alexandria. An electric railway will be constructed from Washington, D. C., through Fairfax, Loudoun and Fauquier counties by way of Aldie and Middleburg.

Sault Ste Marie, Mich.—It is proposed to build an electric line from this city to Cedarville, opposite Les Cheneaux Islands in Lake Huron, and connect with the Detroit & Mackinaw at Cheboygan by way of a ferry line.

Toledo, O.—Officials of the Lake Shore & Michigan Southern Railway say that the visit of W. K. Vanderbilt to this city recently was in regard to the advisability of installing an electric service on the Detroit & Toledo division of the line. It is said that Mr. Vanderbilt has decided the plan is feasible and that it will be put in operation at once. The initial steps in this plan will be confined to the freight business at first.—A new electric line from Jackson, Mich., to this city, is about to be built, and will be known as the Toledo & Jackson Electric Railway.

POWER PLANTS.

Ogdensburg, N. Y.—Electric power generated at Hannawa Falls, 38 miles distant, will be transmitted to this city under a contract signed between the Ogdensburg Power & Light Company and the Hannawa Falls Water Power Company. Transmission will be through aluminum cables. The power will be used for manufacturing purposes, operating the street railway and lighting the city. Thirty thousand hp. is available. Existing plants here will be retained as auxiliaries.

Pontiac, Mich.—The Clinton River Power Company was lately organized here with a capital stock of $75,000, of which $40,000 is paid in. The company will generate electricity at Amy by water power, and sell it in this city for commercial purposes. The plans ultimately contemplate the erection of three dams, which will develop 1,500 hp. This will supply current to all the nearby places and resorts.

BIDS WANTED.

Washington, D. C.—Bids will be received at the Bureau of Supplies and Accounts, Navy Department, until August 1, 1905, for the construction at the new Naval Hospital in this city, of a power house about 88 feet 6 inches long by 36 feet wide. Blank proposals will be furnished upon application to the Bureau. Address T. B. Harris, Paymaster General United States Navy.

NOTES FOR INVESTORS.

Latest quotations for copper are: Electrolytic, 15@15⅛c.; Lake 15@15¼c.; casting, 14¾@14⅞c.

The new securities of the New Orleans Railway Company will be ready for delivery on July 28.

There were produced by American makers in 1904 about 17,500 automobiles, valued at about $22,000,000.

A new street railway company in Philadelphia, with 3-cent fares, is said to be planned by some of the "reform crowd."

The Pittsburg Railways Company has bought the Beaver Valley (Pa.) Traction Company, owning 32 miles of track through the valley.

It is said that the gross earnings of the Philadelphia Rapid Transit Company for the year will amount to $16,400,000, an increase of $470,000 over last year.

The Long Island Railroad Company will begin the regular operation of electric trains on its Atlantic avenue division, Brooklyn, which is part subway and elevated, to-day.

The Hartford & Springfield Street Railway Company, which is managed and controlled by Tucker, Anthony & Co., has increased its capital stock by $200,000 of 6 per cent. preferred stock.

The Keystone Telephone Company has not issued its usual statement of earnings for the June quarter and it is stated that it has not as yet been determined whether reports will be made quarterly as before.

There is considerable strength and activity in Chicago Subway stock. Bullish "points" on the shares continue and a new high-record price, both in New York and on the Chicago Exchange, was established on Monday.

According to Chicago Union Traction interests no progress has been made in the negotiations with the city thus far. The latter appears to insist upon the company furnishing several sets of figures at which it would be willing to sell out.

The recent sale by the Brooklyn Rapid Transit Company of $2,500,000 four per cent. convertible bonds at 86 brings the amount of such bonds now outstanding to $19,500,000. It is probable that the bonds will be the last of the convertible class to be issued by the company.

There are many indications that a traction deal of large magnitude is under consideration in New York and that J. P. Morgan & Co. and Kuhn, Loeb & Co. will play an important part in the transaction. It is believed that the Morgan firm has been quietly picking up traction stocks, under cover, for some time.

It is reported that an important deal has been closed between the Philadelphia Electric Company and the Keystone Telephone Company. It is stated unofficially that the deal refers to the rental of the unused conduits of the telephone company to the Electric Company for a long term of years, which practically eliminates any possibility of competition in the electric lighting business.

The Twin City Rapid Transit Company's quarterly dividend of 1¼ per cent. on the common stock of the company will be payable on and after August 15, at the office of the Farmers' Loan & Trust Company, 16-22 William street, New York City. Dividend checks will be mailed to stockholders who have filed orders. The transfer books for the common stock will close at 3 P.M. on Tuesday, August 1, and will reopen at 10 A.M. on Wednesday, August 16.

EDITORIAL NOTES.

The Risk of Exporting Copper.

The metals to which recourse can be had in case of necessity, in place of copper, are aluminum and iron. The three, therefore, represent the conductors used in electrical construction. Of the latter two only aluminum is of any practical importance, and its cross-section for equal currents would be double that of copper.

The risk of exporting copper from this country, in either a crude or manufactured form, becomes clearly evident when a review of the circumstances relating to the copper industry are presented. According to the record of our exportations of manufactured copper our sales have increased $25,000,000 in the last fiscal year. This means an enormous increase in the very items to which reference has been made, namely, manufactured copper goods. Returning to the proposition, however, it is easy to trace in outline the effects of the continued exportation of this doubly valuable metal, with regard to the public welfare and the individual private interests utilizing it. In this respect it may be stated that copper is the metal, in the United States, which in combination with the various forms of iron in use is wholly indispensable. The electric light interests, comprising the dynamo with its necessary windings on armature and field, and the wiring pertaining to such equipment, are but a single instance of the use of copper. The street railway interests are vaster in a sense than any other, and the enormous amounts of copper employed in their development comprise one of the heaviest demands upon the copper mining industry of which record has been made. It might be stated that the brass foundries consume enormous quantities of the copper alloy for ornamental and other uses; while this is true, the most useful application made of copper as a metal is unquestionably that for electrical purposes.

A shortage of copper would be a severe blow to the electrical industries of the United States. There is not so much copper to be had that the country is safe in exporting it, and it may be added, that there is no more in Europe than the people over there actually need, if enough. The grave problem this country may have to face some day, if too lavish in its sales of this precious and useful metal, will be the risk of industrial depression,

Copper, in the United States, is the most useful of all metals, as far as the science and practice of electric light, street railway and power is concerned. Intense joy over the heaviness of our copper exports is fundamentally and wholly out of place. Governmental supervision, in exercising discretion with regard to its exportation, will have its weight in the near future. Let us keep our copper.

Comparison of Electric Fields by Means of an Oscillating Electric Needle.

Mr. D. Owen recently read a paper on this subject before the London Physical Society. He described several experiments which showed how an electric needle may be used to measure electric fields in a manner similar to that in which a magnetic field is measured by an oscillating magnetic needle. The needles used were cylindrical in form, of aluminum or of brass, and were suspended by quartz fibres three or four inches in length. The couple on the needle when disturbed from the direction of the field is proportional to the square of the field strength. For small displacements the needle vibrates isochronously, the frequency being proportional to the electric force. It may be used in alternating as well as in steady fields, and may be applied to illustrate many of the laws of electrostatics.

The disturbing effect of the needle upon the field is considered; in particular its effect when placed in a uniform field. It was shown by experiments that the disturbing effect falls off rapidly with the distance from the needle, and is inappreciable (in the case of a needle 1½ cms. long) at a distance of twice the length of the needle. With regard to the effect of the dimensions of the needle upon the frequency (for given field), while the restoring couple decreases rapidly with decrease of size, yet the moment of inertia decreases more rapidly, so that the smaller the needle the greater the frequency and also the smaller the disturbing effect. The shielding effect of some dielectric materials was examined in the following way: A needle was suspended centrally in the uniform field between a pair of parallel plates. A thin-walled cylinder of the dielectric was placed around the needle, and the shielding action denoted by a fall in the frequency of the needle. Glass and mica were found to effect perfect shielding. Ordinary paper shields, but when thoroughly dried by heat the electric field is transmitted undiminished only to fall off to zero after a minute or two's exposure to the air. Dry paper soaked in melted paraffin-wax transmits the field perfectly and for an indefinite time.

The paper concluded by pointing out that an electric needle suspended between a pair of parallel plates forms a simple means of measuring high voltages, since the frequency of vibration is simply proportional to the voltage between the plates.

London's Traffic Problems.

The Royal Commission, which was appointed early in 1903 to investigate the problem of locomotion facilities in London, has at last issued the first section of its report. Briefly stated the Commission recommends the appointment by the Government of a traffic board to consider from time to time all measures which are promoted for new lines, surface and otherwise, and all matters arising in connection with locomotion development. The board will have to report annually, showing the progress made. Large extensions of electric tramway systems and the linking up of the at present disconnected lines of North and South London are recommended; local municipal bodies are to be deprived of the powers of veto which they have so disastrously exercised in recent years in preventing the laying down of new tramways by private companies. Many new electric tube and shallow subway railways are outlined as being necessary, and the tendency which has lately been witnessed for amalgamating various underground electric railways and surface trolley lines under one management is shown to be advantageous to the traveling public and in no sense otherwise. Beyond these proposals, and other suggestions for street widenings, etc., the engineering advisers of the Commission suggest as a scheme for consideration with a view to its adoption in years to come the establishment of two great main avenues from east to west and north to south at an estimated cost of $120,000,000. The report, however, urges that the various less sweeping proposals it has made shall not be shelved pending this main avenue scheme, which is regarded as a matter for the future and not for immediate execution.

It is probable that no new undertaking of serious importance will be promoted until Parliament has taken action upon this report. Whether it will be able to take such action before next year is extremely doubtful.

UNDER THE SEARCHLIGHT.

Notes and Comments on Various Topics.

A company is now being formed to acquire 19 of the leading street car building companies in the United States and organize a new company with a capital of $43,000,000. The consolidation embraces nearly all of the plants engaged in the building of street cars in this country.

According to the "Electrician," London, a Reuter telegram from Copenhagen states that the following mail advices, dated July 4, have been received there from Reykjavik: "An agent of Messrs. Siemens & Halske, the well-known Berlin electrical engineering company, is staying here at present. He has laid before the Althing a proposal on behalf of the company for the establishment of wireless telegraphic communication between Iceland and the Continent and between four commercial towns of the island, the company agreeing to provide the installation in return for a single payment of 660,000 kroner (about $183,330). The company offers to deposit a guarantee for the efficient working of the system. The yearly cost of maintenance is estimated at 50,000 kroner (about $13,885). An agent of the Marconi Company has also arrived here, and will submit to the Althing proposals for the installation of wireless telegraphy between Iceland and the Continent and between the four commercial towns of the island. The Marconi Company, it is added, has made experiments in wireless telegraphy from Cornwall to Iceland. These were successful on June 26, 28, 30 and July 3, but less so on other days."

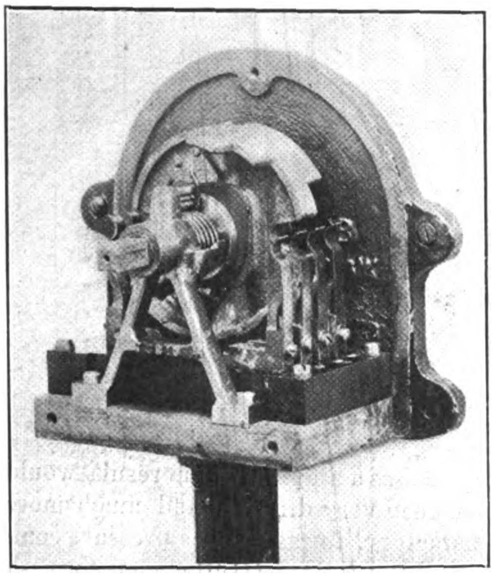
A foreign paper states that the number of passengers carried during 1904 on the Jungfrau railway in Switzerland was 58,036 against 57,167 in 1903. The densest traffic occurred in July and August, in which months the number of passengers was 17,566 and 25,406 respectively.

NEW TRAIN CONTROL FOR BROOKLYN ELEVATED TRAINS.

BY RAY HAMILTON.

When the Brooklyn Rapid Transit Company completed the task of electrifying all the elevated lines operated by them, it became necessary to replace or reconstruct all the rolling stock that had been used in connection with the steam service.

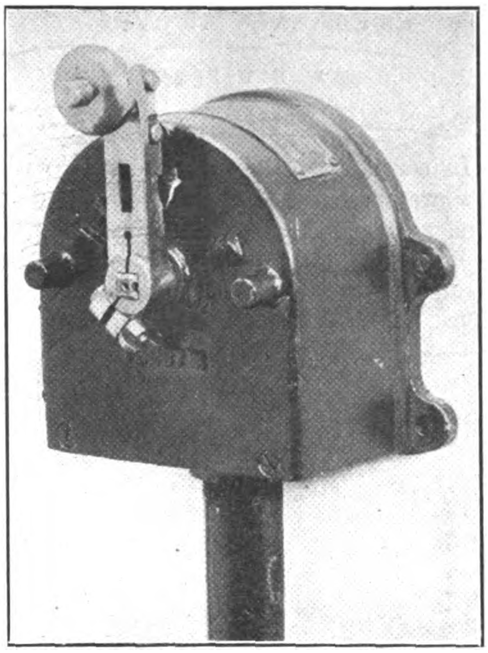
This was accomplished by rebuilding most of the cars at their 39th street repair shops and over 400 cars have been overhauled and equipped with up-to-date electrical devices. The rapidity with which this making-over process has been done has not lessened to any appreciable extent the congestion and the increase in traffic has been so great that a large number of other cars are even now required, notwithstanding the fact that the company foreseeing these very conditions, ordered 100 new semi-convertible cars in 1903.



Interior View of Master Controller.

These cars were delivered six or eight months ago and nearly all of them have been equipped with motors, air brakes and controls, and are now in regular service. The new cars are to all appearances similar to those now in use on the Manhattan Elevated, but closer inspection reveals many features of interest that are not found in the latter, as for instance the semi-convertible arrangement, so that the car may be a closed one or approximately an open one, according to the state of the weather; the underframing is another example of recent improvement in car design, and this construction not only eliminates the usual truss rods, but secures perfect alignment as well.

The platforms are arranged with lifting trap doors and are also provided with steps, so that the cars may be run on either elevated or surface lines. It is essential in this case for the lines that connect Brooklyn Bridge with Coney Island and other seaside resorts are made up of elevated and surface railways, the last named having been formerly operated by steam.



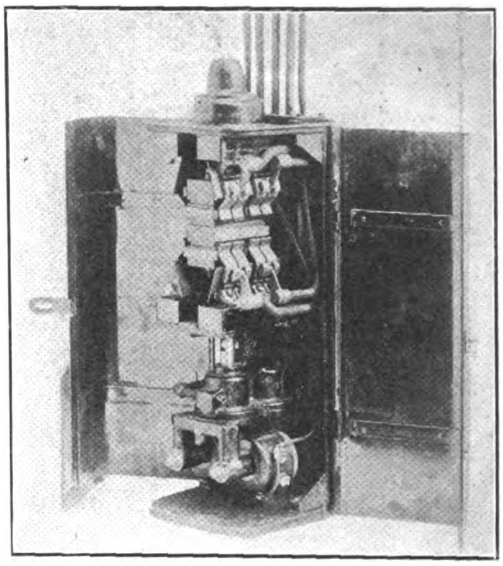
Exterior View of Master Controller.

The underrigging of the new cars is especially noteworthy, for it includes a new and novel electropneumatic system of controlling trains. It is understood, of course, that where a number of motor cars are made up in a single train the motors of all must be controlled from some given point, i.e., the front end or cab of the first car, and that this may be successfully done from the standpoints of both economy and safety is the purpose of the new device. Compressed air is utilized for performing the movements of the controlling apparatus and this is obtained from the air brakes and works under a pressure of 70 pounds per square inch.

The controller comprises 13 main motor switches and each of these has its own air cylinder and interlocking device similar in construction to those used in electropneumatic signaling. Each switch is also provided with a powerful spring so that the former has a normal tendency to remain open, but when the cylinders are charged with air the applied pressure causes the switches to close. To throw the switches, all that is needed is to cut off the air and the sparking that results on breaking the contact is reduced to a minimum by means of a magnetic blowout.

The valves of the air cylinders are operated electrically by electromagnets that are energized by a current derived from a small battery of storage cells giving 14 volts, suspended from the panel of the car. There are two of these batteries, and while one is in use the other is charging. These batteries are charged from the circuit of the main line, the current being cut down either by a bank of lamps or by a compressor motor.

The electromagnets operating the valves are governed by a small master controller, the detailed construction of which is shown in the illustrations. When all the circuits are broken, the handle of the controller is in a vertical position. When the handle is turned toward the right, the motors drive the car forward, and turned toward the left, the car travels backward. There are three right and three left-handed notches; the handle placed on the first notch brings the reverser into proper position, the circuit breaker is then closed, and the motors of each car are connected in series with all the resistance in circuit.

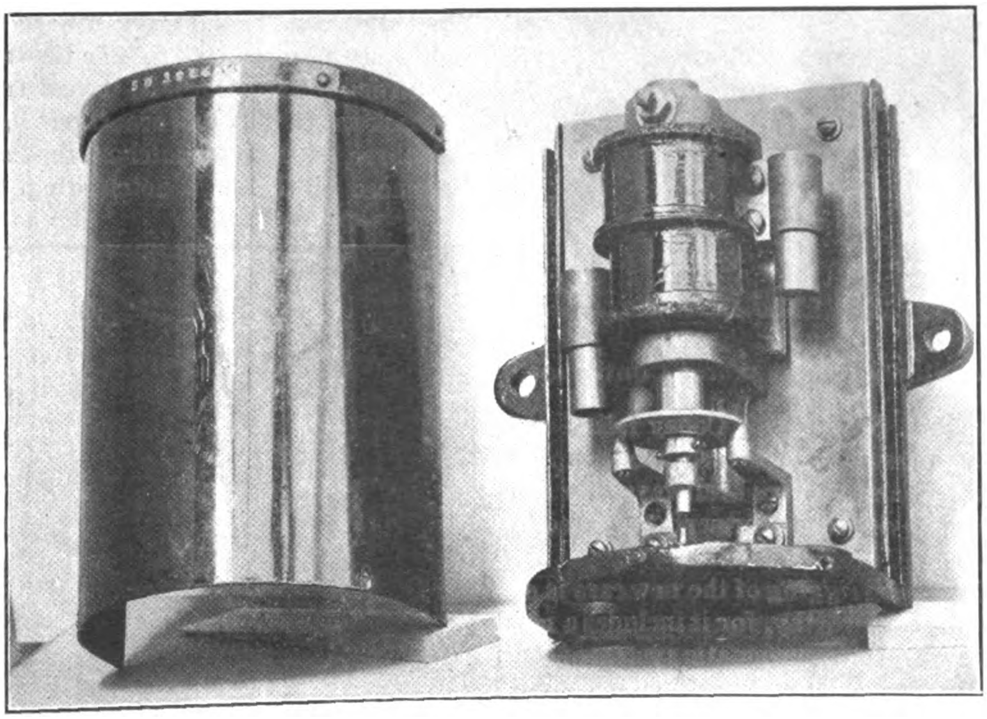


Reverser Used in the Control System

When the handle reaches the second notch, the resistance is gradually cut out, so that the motors are soon running without any artificial resistance in circuit. When the handle is turned to the third notch, the motors are connected in multiple, and the resistance is now in series, which as the motors increase in speed is finally cut out.

The handle when resting on either the second or the third notches of the master controller connects the motors in multiple or in series without resistance, though the amount of resistance is governed automatically by the current the motors take. Two coils, one for operating and one for holding, are associated with each electropneumatic valve. The holding coil, as it is termed, is designed to hold the switch in its proper place after it has been closed by the operating coil.

When one of the electropneumatic valves is set in action by the current flowing through the operating coil, the valve closes its complementary switch in the main current by turning air into the cylinders. The instant the main switch is closed, the holding coil of its electromagnetic valve is thrown into action, and the switch is held closed regardless of the action of the limit switch. The object of the limit switch is to protect the motors from currents greater than they are designed to stand should these flow through the circuit; the limit switch does this by preventing the operating coil from closing the principal switch, but when the current is of normal value, the switches are closed in sequence by the operating coils.



The Limit Switch of the Unit Switch Group Control.

One of the features of the unit train control system is the design of the electric switch pneumatic cylinders. Interlocking contacts are now included in their construction and the contact arms are provided with a long elastic spring to which it is hinged, so that in closing the switch the former is compressed. The contact wiping action of the hinged arm on the spring keeps the contacts clean, while the use of a special soapstone cell keeps them cool.

The limit switches of recent make have contacts of solid platinum and this renders its use absolutely certain. The reverser and air valves are placed in protecting cases, and the whole system is much more simple and compact than those heretofore used, the first item being of importance in its operation, and the second in its maintenance.

EMERGENCY VALVES.

BY W. H. WAKEMAN.

ARTICLE I.

In small steam plants operated with low pressures, where the piston speed is moderate and the travel of flywheel rim well within safe limits, especially if only one boiler is used, there is no great necessity for the emergency valves described in these articles, but where steam at high pressures is used to drive pistons at from 600 to 1,000 feet per minute, bringing the rim speed of flywheels dangerously near the breaking limit, the case is very different, because if an accident does happen, the consequences are liable to be much worse if the engineer cannot control the flow of steam instantly, than where emergency valves are installed and kept in good working order, ready for whatever may happen to bring them into operation.

For illustration of this suppose that we take a plant comprising six boilers of 150 hp. each. On account of some hidden defect, or perhaps to lack of proper care, a tube in one of these boilers fails, filling the room with hot water and steam, making it dangerous to go on top of the disabled boiler to shut the stop valve, which consists of a common globe, angle, or gate valve.

In this connection it is well to remember that if a man draws in one full breath of steam, it is sufficient to cause much suffering and perhaps death.

Under above conditions it is impractical to isolate this boiler from the header into which five others are discharging steam, consequently all that can be done is to bank the fires and let all of the steam escape, which is almost sure to damage the building and cannot fail to cause expensive delay of the works.

If the valve shown in Fig. 1 had been installed as a stop valve the result would have been very different and much more satisfactory, for as soon as pressure commenced to fall, causing steam to rush from the header back into this boiler, the emergency valve, which is now open, would have closed instantly, acting as a huge check valve.

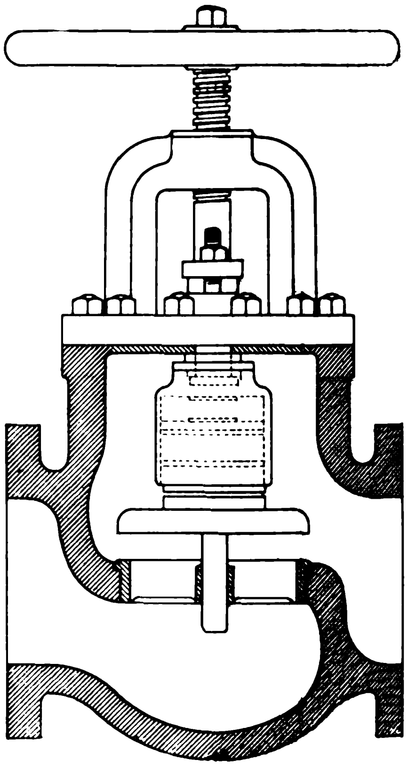


Fig. 1.

Steam and hot water contained in the disabled boiler must of necessity come out into the room but would not disable the whole plant. When one fire was banked the other boilers would continue in operation as if an accident had not happened.

This valve is fitted with a cylinder and plunger as shown, forming a dash-pot, which prevents violent closing of the valve under previously mentioned conditions.

In a certain plant where 20 boilers were arranged in two batteries the following practice prevailed: When one or more of these boilers were cleaned and filled with cold water, steam from the others would be turned into these, heating the upper part of shells but leaving the lower portion cold.

In addition to this unnecessary strain on the parts there was much danger of water hammer striking blows with great force, thus straining the boilers more than their regular working pressure.

With valves like that described or the kind illustrated in Fig. 2 such dangerous practice is impossible. This valve is now closed but when at work under normal conditions steam comes up through the passage 2 and passes out at 3 to the main header, opening the valve 4. A dash-pot is shown at 5 in which a plunger works, and as the stem of valve 4 is screwed into the plunger it prevents too violent action of the valve.

So long as the pressure at 2 is slightly above that at 3 the valve 4 is held open, but when these conditions are reversed the valve closes instantly.

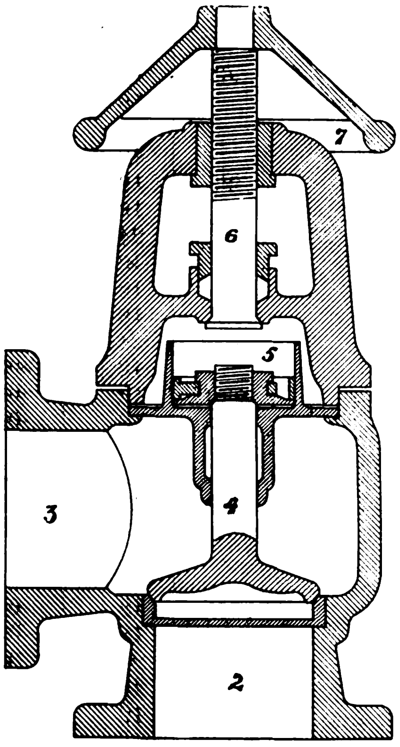

Fig. 2.

From this description it will be plain that if the boiler to which this valve is attached is laid off to be cleaned, no steam can be blown into it even if it is desired to do so as there is no way provided for overcoming the header pressure and opening the valve. The stem 6 may be screwed down by means of the hand wheel 7, but that only holds the valve shut. As a matter of interest I will state that the chief engineer of the plant mentioned did not approve of this dangerous practice, but this was one of those mismanaged places where the chief engineer neither hired or discharged assistants and firemen, consequently he could not control their actions. Boilers were frequently filled with cold water at night when the chief was not on duty.

A boiler ought to be heated gradually until the pressure equals that in the others, then the stop valve should be carefully opened, connecting all into a battery. With these valves in use, this action is performed automatically, without attention from anybody, insuring safety along this line.

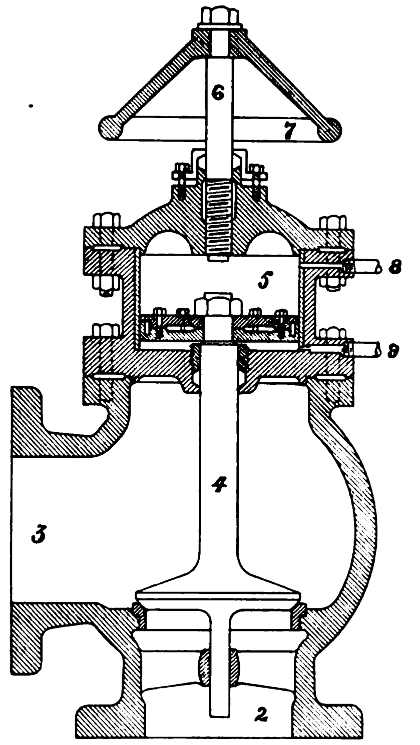

Fig. 3.

Other accidents to be guarded against are those which cause a sudden and violent rush of steam from the boilers into the heater. This can be caused by bursting of the main steam pipe, due to unprovided-for expansion, or hidden defects in pipes or fittings. When a governor belt breaks or runs off from the pulleys which carry it, matters assume an interesting aspect at once unless a safety device of some kind comes to the rescue.

The throttle valve of an engine is usually located in line with the swiftly revolving wheel, making it necessary for the engineer to assume an extremely dangerous position if he attempts to shut off steam and save his engine from destruction.

If a valve is provided in the steam pipe or in each boiler, which may be instantly closed from a safe place, a bad wreck may be prevented.

A valve of this kind is illustrated in Fig. 3 and is operated as follows: Under normal conditions steam comes up through 2 and passes out at 3, raising the valve 4, which carries a piston in the cylinder 5. The stem 6 is unscrewed by means of the hand wheel 7, so that it does not interfere with the valve stem below it unless it is desired to close the valve by hand; 8 is a pipe for admitting steam at boiler pressure, and 9 allows any which may leak past the piston to escape into the atmosphere, thus preventing back pressure on the piston.

A one-half inch pipe is tapped into the upper part of a shell, or into the main steam pipe below the emergency valve. This is carried to some convenient and safe place, where a globe valve is fitted to it, after which the pipe is continued to the emergency valve and connected into 8. If at any time it is desired to shut off steam from the boiler, this one-half inch valve is opened and instantly the flow of steam is stopped. It will be noted that this action does not depend on the direction in which steam is flowing, nor yet upon any slight variation in pressure.

With a battery of six boilers fitted with these positive closing valves, it is necessary to have six small valves. They should be located on a valve board and numbered as shown in Fig. 4.

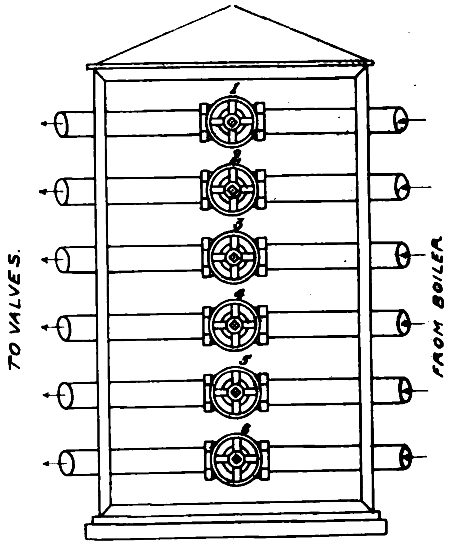

Fig. 4.

In view of the fact that accidents to steam pipes are frequently reported in the mechanical papers, and in some cases much less trouble and damage would have resulted had it been possible to shut off steam at once, the necessity of providing means whereby the stop valves of a plant may be quickly and safely closed must be apparent to everybody interested.

Electrifying China.

As the completion of the electric tramway draws near the rumors among ignorant natives grow apace. The latest is that 500 Chinese heads must be procured and buried under the power house before the "kreta hantu" can start running. In consequence of this rikisha coolies refuse to take fares into the country districts at night.—Singapore "Free Press."

ELECTRICITY LEAFLETS.

BY NEWTON HARRISON, E. E.

THE TRANSMISSION OF POWER.

Capacity and Inductance in Power Lines.—Great power plants are connected with the points of distribution by transmission lines. These line are affected in two respects—first, the electrostatic effect of one upon the other and of each upon the earth; second, the electromagnetic effect of self and mutual inductance. The two effects may be entitled, the inductance and the capacity of the line.

Non-Inductive Circuits.—The conditions which make a circuit inductive or non-inductive may be regarded as those which individually or collectively add more or less of a varying magnetic field to the circuit. For instance, a core of iron around which a coil of wire carrying an alternating current is wound is an extreme case of inductance. The removal of the iron core reduces the degree of inductance, and the straightening of the wire from its coiled form still further reduces it. When two straight wires are employed for the purpose of transmitting electrical energy in the form of an alternating current, they have the least effect inductively upon each other when closest together. In other words, if one wire leading out, and the other leading back to the power house, are installed a short distance away from each other, the effects of self-induction are less than when they are widely separated, but a wide separation between high tension wires is relatively necessary as insulation could not otherwise be secured, particularly during conditions of great dampness or severe rain. The distance between copper conductors will influence the degree of inductance to an extent indicated by the following figures: For a No. 0 B. & S. gauge pair of wires, run parallel and at the distances of 12, 18, 24 and 48 inches apart, the inductances in each case will be respectively .00254, .00276, .00293 and .00331 henrys. A line is necessarily possessed of a certain amount of induction, which in the estimate of its true carrying capacity calls for consideration. It is quite evident that the increasing value of high potentials necessitates the use of greater distances between power lines than would be otherwise necessary. Tests have been made for the purpose of determining the pressure, and distance over which spontaneous sparking would result. The results have been tabulated in a case where a wave form of current was employed with the spark leaping between needle points. A chart with a curve showing the relationship between the distance and pressure with corresponding data is given. The diagrammatic and tabular form in which these facts are given will give some idea of the conditions resulting from the use of high pressures when the questions of inductance and insulation arise:

SPARKING DISTANCES IN AIR FOR GIVEN PRESSURES.

Volts.	Inches.	Volts.	Inches.
5,000	0.225	60,000	4.65
10,000	0.49	70,000	5.85
15,000	0.725	80,000	7.10
20,000	1.000	90,000	8.35
25,000	1.300	100,000	9.60
30,000	1.625	110,000	10.75
35,000	2.000	120,000	11.85
40,000	2.45	130,000	12.95
45,000	2.95	140,000	13.95
50,000	3.55	150,000	15.00

According to these figures, the tendency to reach and pass 100,000 volts for power transmission will mean a distance between conductors exceeding 10 inches. In fact, for the sake of safety, it would have to be considerably greater. High voltages like these are employed in insulation testing, where what is called a breakdown test is made to discover the pressure necessary to puncture the insulating material.

Calculating the Inductance Between Wires.—Various tests may be made to ascertain the amount of inductance between two parallel wires of copper or aluminum by employing a galvanometer and measuring the results obtained. On the other hand, fairly accurate calculations can be made by selecting and using a reliable and simple formula for the same purpose. A formula of this character is given in which

A = distance between the wires in inches,
d = diameter of the wires in inches,
L = the inductance in henrys,

then the total inductance per mile of circuit is found by means of logarithms in the following formula:

$$L = .000558\ [2.303 \text{ log. } \left(\frac{2A}{d}\right) + .25]$$

The logarithm of $\frac{2\,A}{d}$ is a very simple matter to obtain by the ordinary student of arithmetic. A book of logarithms will contain directions for getting results by their use, a matter that can hardly be treated in this article. A table can be built up based upon this formula, in which the inductance is calculated for various distances between wires of different diameters. A table of this character, which will prove serviceable in forming preliminary estimates of results in this respect, in lines about to be constructed, is hereby given:

The influence of inductance is annihilated by the use of concentric conductors or by conductors twisted around each other. The effects of inductance unless remedied are noticeable in the increased impedance in the line and the lag of the current. The nearness of the conductors in pairs is detrimental in that it causes an increased mutual induction between them. To overcome this difficulty, it is necessary to make use of the method of transposition in installing the wires. This consists of the crossing of the conductors at certain intervals so that a neighboring pair of wires remain inductively unaffected by the variations occurring in the first pair. In the diagram are shown instances of transposition and the effects of the same as shown by arrow heads. In the case presented neutralization will result because the transposition occurs at the middle of the lower line and its effect therefore is nil with respect to the neighboring line. The other cases are developed so that a constant transposition is indicated in the diagram. In the case of 20 wires, as illustrated, the upper and lower cross-arms of a pole line are shown with a series of transpositions systematically occurring, as the upper diagram is intended to represent. The entire process is merely the application of the first original idea, logically carried out.

High Voltage Curve.

Capacity of Lines.—The static capacity of transmission lines can be calculated by formulas covering such cases as arise due to the use of insulated lead-covered cables, single conductors with a ground return, or two parallel conductors constituting the total circuit. In the first case the formula give the capacity in microfarads per mile for lead-covered cables:

$$C = \frac{38.83 \times K \times 10^{3}}{\log. \frac{D}{d}} \text{ per mile}$$

For a semi-metallic circuit with ground return:

$$C = \frac{38.83 \times K \times 10^{-3}}{\log. \frac{4h}{d}} \text{ per mile,}$$

and for conductors running parallel to each other:

$$C = \frac{19.42 \times 10^{-3}}{\log. \frac{2A}{d}} \text{ per mile.}$$

where C = microfarads.
K = specific inductive capacity of insulation.
D = inner diameter of lead covering of cable.
d = diameter of conductor.
h = height of conductor above ground.
A = distance between wires.

The capacity of a circuit may be controlled as far as its effects are concerned by the introduction of a certain amount of inductance. By this means a neutralization of one by the other is effected successfully. The relationship of the two must be such that $C = 1 : (2 \times \pi \times f)^2 \times L$, in which f = the frequency and L = henrys. It is obvious that a knowledge of the capacity of mile lengths of three-phase circuits, with the wires at different distances apart, will be extremely valuable in calculating the degree of inductance necessary to clear the conductors of all interference. In the following table the capacity of the microfarads per mile of circuit is given for a three-phase system:

MICROFARADS PER MILE LENGTH OF CONDUCTORS OF A THREE-PHASE SYSTEM.

Size of wire.	Diameter of wire.	Distance between conductors	Microfarads capacity.

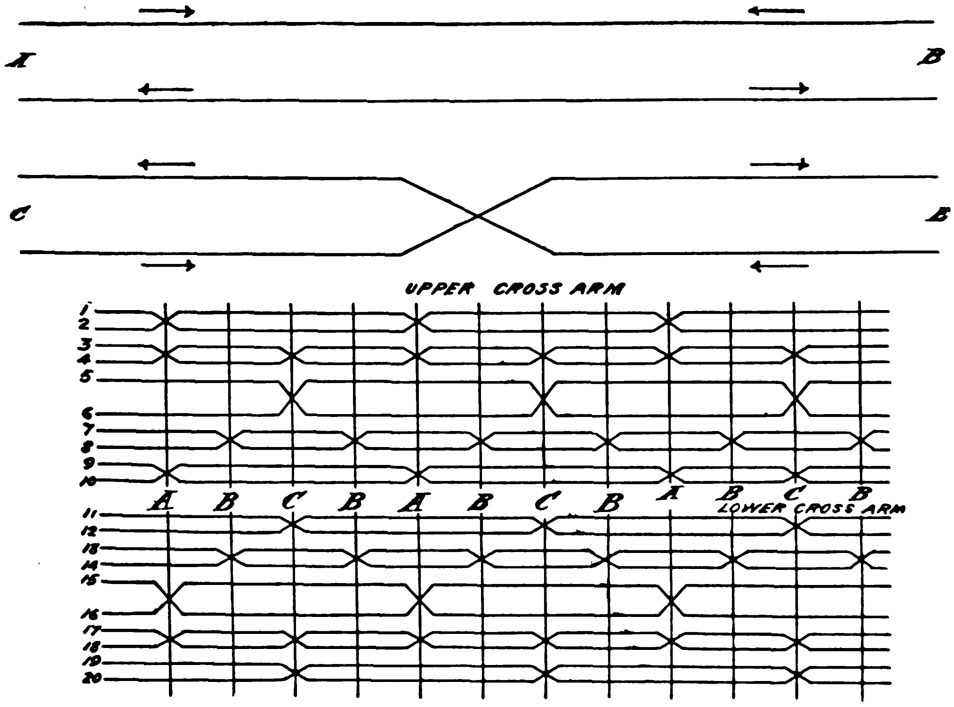
Conductors Carrying Power.—Conductors for carrying power can only be properly estimated on the basis of their weight, strength, temperature, resistance, capacity and inductance. The determination of these elements will lead to the correct commercial estimate of their cost. At its best, power transmission is a financial question involving certain expenditure and returns. The degree of intelligence shown in the laying out of a power transmission system is therefore subordinate to the financial condition involved. It must be applied, so that co-operation of one with the other will lead to the evolution of a paying equipment.



Effective Transposition.

FREE SIGNS AND FLAT RATES.*

BY C. W. LEE.

Publicity is the commercial watchword of to-day. Through divers channels millions of dollars are annually being poured in an effort to reach the buying public. That these efforts are productive of results cannot be gainsaid. The various methods followed in the outlay of this vast expenditure can be summed up in one word—advertising.

By the united efforts of publisher and advertising agent the merchant and manufacturer have been educated into spending a certain percentage of their gross income for publicity. Lighting companies should be deeply interested in and be an aid to the development of this wonderful field of advertising, because of the outlet it offers for the sale of current, which they can readily produce after the present peak hour.

While it is my desire to consider only one phase of the advertising subject—that which relates to the possibilities presented in the use of electric signs as a means of obtaining long-hour customers—yet the entire field when properly developed, as it can be, means an added stimulus to window lighting and closely in its wake will come increased store lighting.

In the development of electric lighting numerous new difficulties are constantly being presented, while but few of the old ones have been left behind. Of these accumulated troubles the majority, in one way or another, apply to that bugbear of all lighting companies, the peak-hour. Try as we may none of us has succeeded in persuading one-half of the public to use current during the day while the other half uses it at night. True, the development of the electric motor and the invention of numerous current-using devices have had a direct bearing upon making the station load more uniform, but at best they have only helped out during daylight, leaving the hours of darkness still to be taken care of.

As it is impossible to induce the use of current when it is not needed, and as we are now supplying the present wants of our customers, it remains for the central station managers to discover new needs and educate the public to accept them. Current for illuminating purposes does not present the proper outlet, for this business is already ours, but the great field of advertising with its limitless possibilities offers many attractions. Here is long-hour burning with the hardest of the missionary work already done. The manufacturer and the merchant are ready and willing to spend money for advertising, but the lighting companies, with a few exceptions, are receiving but an infinitesimal share of the appropriations.

Neither the great general advertiser nor the small storekeeper should be overlooked in an aggressive sign campaign; one has billboards to illuminate, the other a store front. By the introduction of aggressive methods electric companies can fill the night world with light. Why not seize upon this field? Tackle it with vigor. Give signs away, or, rather, loan them to your customers. Don't use half-hearted methods and try to sell them because of the fear of possible losses in the lending. Changeable and interchangeable signs are cheap and by their universal use you can absolutely prevent losses.

I am familiar with the methods of a lighting company, covering a well-populated but scattered territory, which at the beginning of 1904 had less than 50 signs connected. This company adopted the free sign proposition, gave way two standard types of signs, both of which were changeable, and at the beginning of 1905 had over 450 connected, containing a total of 29,749 4-cp. lamps, returning an annual revenue of $59,130.48. This company charged off the first year the cost of constructing signs of changeable letters, as well as all erecting and connecting cost, together with 20 per cent. depreciation on the sign, 5 per cent. depreciation on station, line, meter and transformer investment. Charging the current used at cost, with lamp renewals and maintenance, it earned from 10 to 50 per cent. on the investment for each sign and its pro rata station and line cost.

Many of these signs are now on their second year's burning. This year's profits will be much greater, because all construction, wiring and erection items were charged against the first year. A few customers were lost at the expiration of their first contract, several failed or died after using their signs for only a few months, but those months paid part of the cost of erection, and all signs were immediately installed elsewhere. Signs were put up on one-year contracts, current sold at rates averaging over 10 cents per kilowatt hour, and to insure a proper use a monthly minimum was required equal to about 1½ hours' daily burning. This is not the only company that has worked for its share of the sign business. However, its experience is typical, and the plan succeeded because the promotors had faith in signs and made it easy for its customers to obtain them.

With a view to further increasing the sign business this same company has recently placed in operation a plan whereby the greater portion of its sign lighting will be entirely removed from its peak during the months when the peak must be considered. Free signs on a flat rate for certain stipulated hours each night is the nucleus of this plan. The time of switching on is placed about half an hour after the peak load. The turning on and off of signs is controlled by patrolmen, who not only attend to these duties but inspect all signs as well as solicit new business. It is expected that as soon as this plan is under full headway, the increased business will necessitate the running of special sign circuits from the station. In this event the expense of patrolmen would be eliminated. Isolated signs at some distance from the main streets are controlled by time switches.

---

*Paper read before the National Electric Light Association at its 28th convention, held at Denver-Colorado-Springs, Col. June 6-11,

The flat rates adopted are based upon current for the first two hours each night at regular rates and at a low rate for every hour's burning thereafter. Customers are thus induced to continue long-hour burning.

The meter has been a formidable obstacle in the upbuilding of the sign business. In most cities and towns the early closing movement is in vogue and this makes the flat rate welcome, as many merchants are obliged to leave their signs and windows in darkness rather than go to the expense of employing a watchman to cut their lights out at a certain hour.

The flat rate has a particularly good effect on sign lighting as it insures use of the sign six or seven nights a week, while those operated on a meter basis are used only the nights when the store is open, which is the time when we already have large demands for our current.

Before the adoption of this flat rate schedule it was argued that no customer would be willing to contract for a sign that could not be turned on during the first half-hour of darkness, but experience has proven that this question is waived in many instances, the specific rate overshadowing this point. To the customer who desires the other method the meter is always available. Again, this flat rate has been the means of stimulating a large amount of sign business away from the heart of the retail district. It finds favor with the neighborhood stores and with business places on the back streets. Further, it has demonstrated the fact that an electric sign as an advertising medium is a pronounced stimulus to trade in the outlying districts.

If the flat rate is feasible for sign lighting why not apply it to window lighting as well. As the hour of closing comes the average merchant turns the key in the door and leaves his entire store in darkness, the very best advertising hours for his wares being thereby lost. If he could be assured of a specific rate per month for the lighting of his display, would not such a rate be an inducement to have lighted windows until 10, 11 or 12 o'clock each night? Sunday window lighting could also be induced by this method. It is strange that so many merchants allow this, the best advertising day in the week, to slip by without taking advantage of it. On Sunday evenings, while waiting for cars or strolling for pleasure, people have more opportunity to inspect windows than at other times.

ILLUMINATED BILLBOARDS.

By the large national advertisers, billboards and sign boards are now classed with the newspapers and magazines as strong mediums for reaching the public purse. The latter can be read during both daylight and night hours, but not so the billboard. Its usefulness ceases as soon as the sun goes down. It is through the medium of the lighting companies of the country that these billboards can be made to tell their story by night as well as by day. In treating this subject in a general way I am fully aware that in a few metropolitan centers illuminated billboards are maintained to a limited extent.

Recently, in conversation with one of the members of a large bill-posting company, I discovered a decided leaning toward the illuminated billboard. There is no question but that the National Bill-Posters' Association would welcome a plan whereby the efficiency of advertising space could be made more valuable. In the past they have fought rather shy of this matter, owing to the great difference in the lighting rates prevailing over the country. If there were some means whereby this association could meet the National Bill-Poster's Association on a fair footing, establishing a uniform lighting rate for the entire country (by that I do not necessarily mean a low rate) I believe that it would be the means of producing a splendid volume of new business in which all lighting companies would eventually participate.

Advertising appropriations are usually distributed through advertising agencies. Experts plan the campaigns with the expectation of obtaining certain results. Various mediums are used, according to the product to be sold. For their services the bill-posting companies charge a specific amount per foot for painting, a specific amount for position and a specific rate per sheet for posting. This rate is uniform throughout the United states. All of the details of illuminated billboards would fall upon the bill-posting company; maintenance, posting and collections. It would then only rest with the lighting companies to furnish current at a uniform rate.

For instance, should the American Cereal Company, manufacturer of Quaker Oats, desire to cover the State of Colorado with an illuminated billboard campaign, it would only be necessary to place the order with the Denver Bill-Posting Company for, say, 300 boards. They would be able to quote at once a specific price for this service, and could guarantee location, posting and illumination, knowing the prevailing rate for lighting.

I believe that this plan is worthy of consideration by this association. The advertiser is seeking novelties, he has the money to spend and it only remains for the lighting companies to come forward with a plan to be able to secure their share of the advertising appropriations.

WRINKLES.*

EDITED BY H. C. ABELL.

Synchronous Motors as Alternating Current Generators.

At Montgomery, Ala., four direct current, 500-volt generators are operated by synchronous motors, which are driven by the current from a water-power plant 30 miles away. The motors and direct current generators are so arranged that they can be operated by steam engines in case of any trouble or any shut-down at the hydraulic station. The synchronous motors are then driven by the engines, and become alternating current generators, furnishing the alternating current.

W. WHEELER, Montgomery, Ala.

Setting Line Poles in Concrete.

Where line poles are to be set in concrete, use cinders about 1 inch in diameter in place of stone in making the concrete. This is cheaper than cracked stone, where station is run by steam power, is sufficiently strong to make a good setting and is much more easily broken out than concrete made with stone when the pole has to be reset or removed.

P. C. BROWN,
Brookline, Mass.

A Quick Method of Planting Poles.

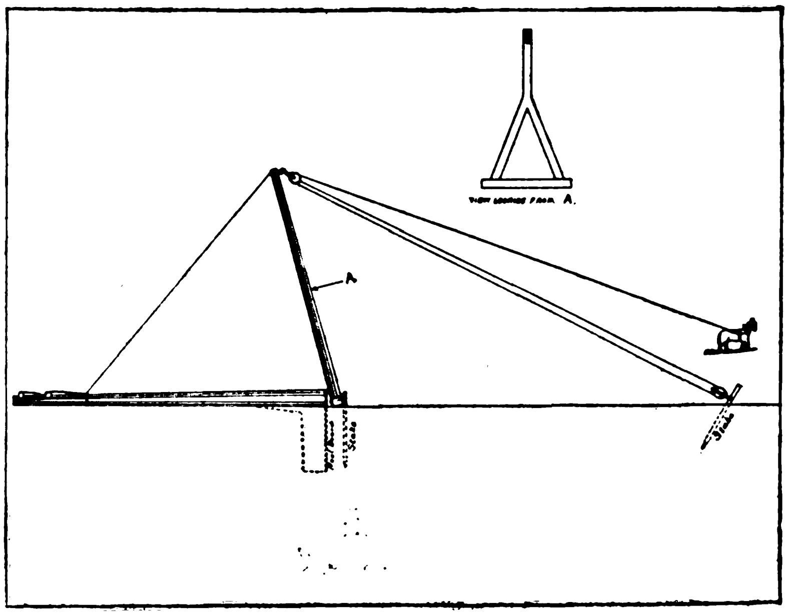
In constructing the transmission line from Montgomery to Tallassee, Ala., it was necessary to erect over 1,500 poles, varying from 85 to 65 feet in length.

---

*Paper presented before the National Electric Light Association at its 28th convention, held at Denver-Colorado Springs, Col., June 6-11 1905.

Many of them had to be erected in wet and swampy ground where pikes could not be used. The poles were fitted up with cross-arms, pins and insulators, and erected by a horse pulling on a breast derrick, as shown in sketch. At the point where the rope from the breast derrick is attached to the pole to be raised, four or more guy ropes were attached, so that the pole could be lined up by a man pulling on the guy rope in any direction the pole had to go. The guys were fastened to the pole in such a way that by pulling on a small half-inch rope after the pole was in position all the ropes were dropped to the ground without the need of a climber to unfasten them. This arrangement proved to be a great saver of time and labor.

G. A. Montgomery, Montgomery, Ala.



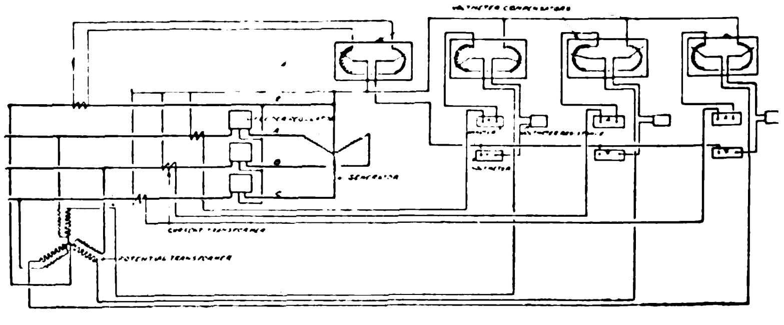
Raising Pole.

Voltmeter Compensators on Four-wire, Three-phase Circuits.

In order to secure maximum efficiency of feeder copper in connection with single-phase lighting circuits on three-phase four-wire distribution systems, three single-phase feeders running along the same pole line for a portion of their length should be combined along such portion into four-wire, three-phase feeder. The loads on the three feeders will, in general, be unequal, and the common neutral wire will carry the unbalanced current. Under these conditions, and where voltmeter compensators are used in the station, some difficulty has been experienced in securing on the feeder voltmeter a correct indication of the voltage at the feeder ends. The diagram herewith shows a scheme of connection for voltmeter compensators which accomplished this result.

It will be noted that a voltmeter compensator is installed on the neutral wire as well as on each phase wire. The neutral compensator is adjusted to compensate for the drop in that portion of the neutral wire that is common to all three circuits. Each of the compensators on the phase wires is adjusted to compensate for drop from the end of the common neutral to the feeder end and back to the station. In other words, the compensator on each phase wire is adjusted to compensate for the drop in that portion of the circuit traversed by the current shown by the ammeter on that phase, and the neutral compensator is adjusted to compensate for the drop due to the unbalanced current in the neutral wire. In general, current in the neutral wire will not be in phase with the current in any of the phase wires, but if the connections of the compensators are made as shown, and the compensators properly set, the voltmeters at the station will indicate the voltage at the end of the single-phase feeders regardless of the distribution of load on the the three circuits. It is always advisable to check the compensator settings by observations of the voltage at the feeder end.

D. W. Roper, Chicago, Ill,



WIRING DIAGRAM OF VOLTMETER COMPENSATORS FOR 4 WIRE 3 PHASE FEEDERS

Wiring Diagram.

Not Ready for Municipal Ownership.

Although Mayor Dunne, of Chicago, refuses to make public the contents of the report of James Dalrymple, of Glasgow, who inspected Chicago's street railway system, with a view of advising the officials upon municipal ownership plans, it is declared that an article on Chicago, in the "London Tramway and Railroad World," gives the essential features of his report. In this article Mr. Dalrymple says in part:

"I would be much astonished if the city could afford to purchase the undertaking, including the value of the unexpired franchises. The city council is a very able and intelligent body, but if it went in for municipal ownership it would have to eliminate the political element.

"If Americans could eliminate their present method of political influence, they would quickly make a considerable advance in municipal ownership affairs. They have a large number of bogus claims for alleged accidents, because a street railway company can never get justice from an American jury.

"The discipline of the employes is not quite as good as here. They are more thoroughly organized, are a bit more independent and on the whole have got more power than they ought to have."

Trunk Line Operation.

In the current issue of the "Century" Mr. Frank J. Sprague has written an interesting article on traffic problems in which he says that "there are nearly 30,000 miles to the credit of the electric railway in the United States alone, but the character of the traffic and the house-to house service performed by a large portion of it is essentially distinctive, and reason enough for its creation irrespective of the condition and requirements of trunk-line operation. Save on elevated and underground roads of short length, it has been essentially a service of single cars at frequent intervals and convenient stops. But it is hardly necessary to point out that trunk line operation as at present conducted consists largely in the dispatching of heavy units at frequent intervals over long distances, and this is maintained in the United States on over two hundred thousand miles of road, or fully half a million miles of track, with terminals, routes and service in the main well settled, and on which exists a system of train make-up and interchange of cars, both freight and passenger, which cannot be readily changed. Yes, right in the metropolis of the United States we are confronted with grave and complicated problems incident to local conditions which are calling for an expenditure of nearly eighty millions of dollars, supplementing the electrical equipment of the surface, elevated and underground lines, all made possible chiefly because of the electrical development. And the solution of these problems will demonstrate that, so far as speed and power are concerued, the maximum capacity of any steam locomotive will be more than equaled. If so, then it may be asked, Why does it not settle the trunk-line problems? Largely because the conditions are special in character, and must be solved, simply because they can be, without too great regard to cost."

Municipal Electricians' Convention.

The tenth annual convention of the International Association of Municipal Electricians will be held at Erie, Pa., August 23, 24 and 25. The following papers will be presented and discussed:

"The Effects of Electrostatic Influence in Telephone and Telegraph Circuits," by H. R. Allensworth, Columbus, O.

"The Advisability of Fusing Fire and Police Telegraph Boxes," by C. E. Diehl, Harrisburg, Pa.

"Electric Light Engineering," by A. S. Hatch, Detroit, Mich.

"Erection and Maintenance of Electric Lighting Plants," by C. L. Williams, Meridian, Miss.

"Suggested Improvements in Fire Alarm Telegraph Systems," by Capt. Wm. Brophy, Boston, Mass.

"The Necessity of a Rigid Inspection by the Municipality," by T. C. O'Hearn, Cambridge, Mass.

"Underground Construction," by Louis Gascoigne, Detroit, Mich.

Change in Presidency of Schenectady Road.

The announcement is made in Schenectady, N. Y., that Hinsdill Parsons has resigned as president and director in the Schenectady Railway Company. General Manager E. F. Peck, of the company, it is stated, will succeed him. The recent sale of the control of the road to the New York Central interests by the General Electric Company is undoubtedly the cause for the change. Mr Parsons is the fourth vice-president of the General Electric Company.

Edison's Automobile Battery.

Mr. Thomas A. Edison announces that he will have a new storage battery for autos on the market this fall. "The cost of operation," he said "has been found to be 58 per cent. of that of horses. I am prepared to make the unqualified statement that the Edison battery will revolutionize the storage battery problem. The new light battery is an accomplished fact. It will weigh just one-half of the present battery in general use, and will be about the same size."

Electric Railways on Canadian Frontier.

Mr. Frederick Nicholls, president of the Toronto-Niagara Power Company, has been telling the mayor and the members of the common council of the city of St. Catharines, Ont., that his company is about to carry out a scheme for electric railway building on the Canadian-Niagara frontier and in the Niagara peninsula, which will make St. Catharines one of the greatest electric railway centers in the country.

Old-Time Telegraphers' Reunion.

A large attendance is expected at the 25th annual reunion of the Old-Time Telegraphers and of the Society of the United States Military Telegraph Corps to be held in New York City at the Waldorf Astoria, August 29, 30 and 31 and September 1. Mr. John C. Barclay, general manager of the Western Union, is president of the Old-Timers, and Mr. W. B. Wilson, of Philadelphia, is head of the Society. The banquet will take place August 31. Business meetings will begin on Tuesday, the 29th.

Alleged Robberies Cause Bankruptcy Petition.

A petition in bankruptcy has been filed against the Joseph Menchen Company, manufacturer of electrical appliances and stage lighting apparatus at 354 West 50th street, New York, by the following creditors: E. B. Latham & Co., Elmer T. Morris Company and the International Brass & Electric Company. It was alleged that the company is insolvent, and permitted certain creditors to obtain a preference by legal proceedings. Joseph Menchen is president of the company. It is said that the principal cause of the embarrassment is losses of materials by robberies at various times. Le Roy S. Gove has been appointed receiver.

ELECTRICAL PATENT RECORD.

LETTERS PATENT ISSUED JULY 25, 1905

Electric Railways and Appliances.

795,285. Electric Switch. William S. Jackson, Hoboken, N. J. Filed Aug. 27, 1904.

795,322. Railway Block-Signal System. Ludwig S. Walle, Brooklyn, N. Y., assignor to Fridtjof Jebsen, Bergen, Norway. Filed Dec. 29, 1903.

795,452. Trolley-Wheel. William K. Richardson, Leavenworth, Kan., assignor of one-half to Martha L. Richardson, same place. Filed Oct. 17, 1904.

Electric Lights and Appliances.

795,492. Incandescent Electric Lamp. Timothy G. Dineen, St. Louis, Mo. Filed Aug. 6, 1904.

795,681. Electric-Arc Light. Heinrich Beck, Meiningen, Germany, assignor of one-half to the Physikalisch-Technisches Laboratorium G. M. B. H., Meiningen, Germany, and one-half to the Allgemeine Lichtgesellschaft mit Beschrankter Haftung, Berlin, Germany. Filed Jan. 21, 1904.

Electrical Machinery and Apparatus.

795 340. Circuit-Closer. Eugene R. Carichoff, East Orange, N. J., assignor to the Sprague Electric Company. Filed Aug. 25, 1900.

795 369. Automatic Controller. Ernest Schattner, Schenectady, N. Y., assignor to the General Electric Company. Filed July 8, 1904.

795,392. Automatic Regulator for Alternating Current Motors. George H. Hill, Schenectady, N. Y., assignor to the General Electric Company. Filed Jan. 15, 1904.

795,462. Electric-Control Apparatus. William A. Turbayne Lancaster, N. Y., assignor to the Gould Coupler Company, New York City. Filed Sept. 15, 1904

795,481. Dynamo-Electric Machine. Henry Chitty, London, Eng. Filed April 11, 1907.

795,541. Apparatus for Electric Welding. John C. Perry, Clinton, Mass.; William S. Perry executor of said John C. Perry, deceased; said executor assignor to the Clinton Wire Cloth Company. Filed March 23, 1901. Renewed Jan. 7, 1905.

795,570. Current-Controller. Swen G. M. Anderson, Chicago, Ill. Filed Jan. 27, 1904.

795,670. Electric Controller. William R. Whitehorne, Bethlehem, Pa. Filed March 28, 1905.

795,780. Alternating-Current Motor. Maurice Milch, Schenectady, N. Y., assignor to the General Electric Company. Filed Jan. 2, 1904.

Telephones and Telephone Apparatus

795,403. Telephone-Call Register. August Meyer, Baltimore, Md. Filed Aug. 24, 1904.

795 532. Selective Signaling Apparatus. Frank R. McBerty, Evanston, Ill., assignor to the Western Electric Company. Filed April 4, 1901.

795,533. Telephone Exchange Apparatus. Frank R McBerty, Evanstop, Ill., assignor to the Western Electric Company. Filed Sept. 28, 1903.

Miscellaneous.

795,318. Annunciating Mechanism. Charles E. Trump, Philadelphia, Pa., assignor to the Novelty Electric Company, same place. Filed July 28, 1904.

795,396. Elastic-Fluid Turbine. Oscar Junggren, Schenactady, N. Y., assignor to the General Electric Company. Filed April 29, 1903.

795,402. Telegraph and Like Cable. Oliver J. Lodge, Birmingham, Eng. Filed Dec. 9, 1904.

795,467. Electric Terminal Bond. Henry J. Wessinger, Duluth, Minn. Filed April 15, 1904.

795,512. Electric Railway Signal. Charles F. Hoover, Lockport, N. Y. Filed Jan. 12, 1904.

795,538. Protective Device for Electric Circuits. Joseph J. O'Connell, Chicago, Ill., assignor to the Western Electric Company. Filed July 20, 1904.

795,607. Electrician's Tool. Arthur E. Haff, Adams Mass. Filed Feb. 14, 1905.

795,726. Electric and Pneumatic Governor. William H. Nightingale, Philadelphia, Pa., assignor to John E. Reybnrn, same place. Filed July 16, 1904.

795,762. Wireless Telegraphy. Manual R. Garcia, Paris, France. Filed Jan. 10, 1901.

795,803. Electrical Resistance. Elise Vedovelli, Paris, France. Filen May 23, 1904.

THE TELEPHONE WORLD.

Independent Company in Syracuse.

After a long fight a deal has been closed whereby the Independent Telephone Company, recently organized by capitalists of Syracuse and Rochester, N. Y., comes into possession of the Crouse stable in South State street, Syracuse. The building will be remodeled for telephone offices.

A new switchboard has been ordered to cost $175,000. It will be constructed by the Stromberg-Carlson Telephone Apparatus Company of Rochester.

It is expected that the company will be ready to give public service by December 1.

The company's engineers are in Syracuse to look over subways and other necessary preparations for the installation of the new plant.

England May Control Telephones.

A cable dispatch from London says that unless all indications are wrong London, and probably all England, may have a telephone system owned or controlled by the Government. A special committee, elected by the House of Commons and led by Stuart Worthley, is even now looking into the mass of correspondence exchanged between the Postmaster-General and the National Telephone Company for the purchase of the company's property by the British Government.

In the House of Commons, as well as in the business world, there is an overwhelming opinion in favor of Government ownership of telephones. The controller of the London County Council says that he hopes that if the Government purchases the telephone system a reduction of charges will soon follow, so that the charge for a call in London proper will be only three cents, and this both he and the chairman of the committee think will greatly increase the general use of the telephone.

The Kinloch Long-Distance Telephone Company of Missouri lately filed a deed of trust in the Recorder's office in Clayton, for $5,000,000. The loan is secured by all its property, both tangible and intangible. The deed was given to the American Trust & Savings Bank, and George W. Galbraith, trustee. The loan bears 5 per cent. interest and will mature January 1, 1929.

The Farmers' Telephone Company, Cochrane, Wis., is a mutual concern, with the following incorporators: Fred Putz, Fred Hansen, R. C. Hener, E. C. Miller, Herman Putz, Albert R. Suhr, George Muehlelsen, G. Klein, G. Bass, J. H. Herold, James B. Hope, John Staak, William Huth, Edward Hornburg, A. R. Mohuk and W. M. Belitzen.

Telephones may play a prominent part in the settlement of differences between the railway telegraphers and officials of the Northern Pacific and Great Northern roads. The system is so complete on the the Rocky Mountain didivisions of the two roads that it could be used in case of a strike of telegraphers.

The Home Telephone Company, of Louisville, Ky., has purchased a franchise for a telephone system in Pewee Valley. The franchise was sold by the board of trustees of Pewee Valley, and was purchased by D. H. French for the Home Company.

The Bell and Keystone Telephone Companies' Business.

The "new blood" in the Keystone Telephone Company of Philadelphia is causing the Bell Company, of that city, a little uneasiness. The indications are that this year the Keystone will earn net fully one and one-half times the amount required to pay the interest on the $4,000,000 5 per cent. bonds it has just sold, and the Bell, which pays 6 per cent. dividends, should show at least 10 per cent. earned or $600,000 surplus over the $840,000 necessary for the dividend.

The announcement that the Keystone plant has cost $5,053,000 to date, shows that this company now has an investment in plant equal to nearly one-half the cost value at which the Bell Company carries its plant on its books.

Mr. Bryan Wants Cities to Own Telephones.

At Lima, O., Mr. William Jennings Bryan, in an interview, declared for municipal ownership of telephones.

"A city should have only one telephone system," he said. "More than one works an unnecessary hardship upon the business and professional people, who are forced to rent two or three telephones, when one should be sufficient. One system of rural telephone service is sufficient, and that should be owned by the county. The city should own its system."

District Manager E. W. Adams, of the Central New York Telephone & Telegraph Company, has resigned, and William Bedell, who has been wire chief, will succeed him as district manager. The change goes into effect this week. The company has recently installed a number of services in the country by what is called "10-party lines." Ten telephones are connected with each line and the line connected with the general exchange. One recently completed is in North Syracuse, and another is being placed in the vicinity of Warner.

A. T. Perkins, of St. Joseph, Mo., division superintendent of the Burlington Railway, recently said that the Burlington is considering the construction of a new telephone service between Kansas City and St. Joseph for use in general operation of the line. The Burlington now has one set of telephone wires in use between the towns, and they are giving such satisfaction that the new ones have been asked for.

W. C. Prichett, engineer for the Southwestern Telegraph & Telephone Company, is in Laredo, Tex., drawing plans and forming estimates for the installation for a new exchange system and plant. He says that the workmen will be sent immediately after his preliminary work is done and that before the end of this year the new plant will be installed and in operation.

The Eureka, Cal., telephone franchise was sold by the city council to W. W. Allen, an attorney of San Francisco, for $3,000, twenty-five per cent. of which was deposited with the city clerk. Allen refuses to state whom he represents.

New England Telephone Company Increases Capital.

The directors of the New England Telephone & Telegraph Company have voted to increase the capital stock of the company to the extent of 30,860 shares of $100 each for the purpose of providing funds for the payment of its third series of bonds due in 1906, and for the extension of the property and business of the company.

The new stock will be issued at par to stockholders of record at the close of business August 19 in the proportion of one new share for every eight shares now outstanding.

With the advance in telephone rates recently put in force at the office of the Cortland, N. Y., Home Telephone Company, the business of the company is falling off. Already many 'phones have been ordered out of the residences and during the present month a large number will be taken out. The rates for business places have been raised from $24 to $30 a year, and in residences the rate has been jumped from $12 to $18 on single lines and from $12 to $15 on party lines. Although the company is run under the name of a local corporation, it is practically under the control of the Bell Company, it is said.

Pursuant to a decree by the court of common pleas of Bucks County, Pa., all the lines of telephone and telegraph franchises, leaseholds and all other property, real and personal of the Standard Telephone & Telegraph Company, will be sold at public sale at Doylestown on Saturday, August 12, at 11 A.M., at the Bucks County Trust Company. The upset price fixed by the court is $24,000. The property includes three pieces of real estate in Doylestown, Newtown and Bristol.

A telephone company has been organized by the Grand Marais, Mich., business men, and the work of installing the system will be commenced as soon as the material, already ordered, has arrived from Detroit. C. C. Smith is president and R. E. Schneider, secretary. A list of 150 subscribers is expected within a few months. The line will connect with the Government system extending from the lighthouse to the life-saving station at Whitefish Point.

The Burning Springs and Booneville, Ky., Telephone Company has completed a telephone line from Burning Springs to Booneville, giving connection to Booneville. The town never had a telephone or telegraph connection before. It is now possible to make a connection with any point in the State.

The ordinance regulating telephone rates within the city limits of St. Paul, Minn., was killed in the board of aldermen, later resurrected by a vote to reconsider and its consideration finally postponed until the second meeting in August.

Telephone Incorporations.

The Milledgeville Mutual Telephone Company, Milledgeville, Ill. Capital stock, $10,000. Incorporators: T. H. Fleming, A. B. Puterbaugh and A. M. Fike.

The Southern Michigan Telephone Company Three Rivers, Mich. Capital stock, $300,000.

GENERAL ELECTRICAL NEWS.

LIGHTING.

Chittenango, N. Y.—The trustees of the village have given an electric light contract to C. W. Bull, of Syracuse to light this village for five years.

Houghton, Mich.—The Superior Construction Company, of this city, is preparing plans. and specifications for the proposed municipal lighting plant at L'Anse.

Johnsonburg, Pa.—The Johnsonburg Electric Light, Heat & Power Company has been incorporated with a capital of $25,000.

Knoxville, Tenn.—A contract has been let for the construction of an electric light plant for Tennessee College at Fountain City. Before school begins, a complete electric light plant will be installed.

Milwaukee, Wis.—Specifications for lighting the streets and public buildings of this city under a new contract, requested by the common council, has been submitted to the council by the board of public works. They provide that the 1,926 lamps used shall be 480 watt instead of a 2,000 cp. light, as they are usually designated. Bids will be asked for a term of one, three, five and ten years.

Newman Grove, Neb.—At a special election the proposition to issue $6,000 in bonds for the purpose of establishing and erecting a lighting plant was carried.

North Manchester, Ind.—Dr. D. Ginther and others have been granted a franchise by the town council to establish a system for the transmission of electric light, heat and power in this city.

North Tonawanda, N. Y.—L. T. Palmer, manager of the Niagara Light, Heat & Power Company, has gone to Boston to consult the directors with a view to erecting an electric light plant.

Paul Smith's, N. Y.—The Paul Smith Electric Light & Power Company, with its principal offices here, has been incorporated.

Pittsburg, Pa.—An electric light rate war has been started in the towns in the Upper Monongahela Valley. The Monongahela Light & Power Company had a monopoly of the lighting business until an Independent concern of Turtle Creek, the Rose Hill Electric Light Company, entered the field. The new company will furnish light to three of the seven boroughs in the Turtle Creek Valley and the Monongahela Company has brought down its rates more than one-fourth.

Pontotoc, Miss.—At an election here recently the issuing of bonds for a modern electric light plant to be owned and operated by the city, was voted upon and carried. This means the immediate installation of an up-to-date system.

Springfield, Mass.—The United Electric Light Company, of this city, has filed a statement of its condition on July 20, 1905, with the Secretary of the Commonwealth. It shows profit and loss of $88,605, against $81,268 one year ago.

Union City, Tenn.—The councilmen at their last meeting decided that the town was sufficiently large to have a few arc lights, which will soon be put in, and which will doubtless be followed by others.

Wilson, La.—This town contemplates installing an electric light plant and waterworks. Address the town clerk.

York, Pa.—The bonds of the York & Windsor Electric Light Company are ready for delivery.

STREET RAILWAYS.

Berkeley Springs, Md.—Two West Virginia capitalists will appear before the Morgan County Court here August 12, and file an application for a franchise over the county road from this place to Hancock, for the purpose of constructing an electric trolley line.

Cincinnati, O.—It is stated in well-informed circles that the deal for the purchase of the Dayton & Western Traction Company, by the Widener-Elkins-Dolan Syndicate, is off. This road is desired by President Schoepf, of the Cincinnati Traction Company, as a part of his river-to-lake trolley line. It is believed, however, that the negotiations will be resumed in the fall.

Fitchburg, Mass.—The aldermen granted a franchise to the Fitchburg & Princeton Street Railway Company, whose stockholders are the same men who own the Worcester & Northern and the Worcester & Holden. They have already begun building north from Holden, and will make almost an air line from here to Worcester.

Lima, N. Y.—The franchises, rights of way, property and assets of the Lima-Honeoye Electric Light & Railroad Company have been sold by Receiver Hill to William J. Connors, of Buffalo. The price paid was $16,000. It is understood that the road will now be extended.

Macon, Ga.—If there should be any hitch in building the proposed trolley line between this city and Atlanta, the indications are that a big Western firm will immediately take up the work and get electric cars running between these two Georgia cities. At least that is what the officials of the firm say in a letter received by Mayor Smith.

Rochester, N. Y.—Clifford D. Beebe, general manager of the Rochester, Syracuse & Eastern Railroad, says that 37 miles of double track between Rochester and Lyons will be in operation by November 15. The road will be constructed as far as the canal bridge in the village of Lyons, where it will stop until after the exact route for the barge canal has been decided upon.

Springfield, O.—The stockholders of the Springfield, South Charleston, Washington & Chillicothe Traction Company decided to have the receiver sell the property as soon as the requisite order of court can be obtained.

Syracuse, N. Y.—Horace E. Andrews, president of the Utica & Mohawk Valley Railway Company, says that the work of electrifying the West Shore Railroad has been commenced, and that early next spring electric trains will be in operation between this city and Utica. The cars will be operated on the multiple unit control system, similar to the subway and elevated trains in New York. The speed will be equal to that of the average steam railroad trains on the Central, and there will be trains in both directions every hour and sometimes a half hourly service will be operated.

Toledo, O.—Work will be begun soon on the grade for the Toledo, Port Clinton & Lakeside Electric Line between Genoa and Toledo.

Toronto, O.—The prospects are now almost certain for connecting Wellsburg and Bethany by an electric trolley line.

POWER PLANTS.

Dover, Del.—At the State Department, certificates of incorporation were issued to the Yaco Company. It is to purchase, acquire, construct and operate power plants for the distribution of gas and electricity. The incorporators are chiefly of Wilmington. The capital stock is $1,000,000.

Ft. Wayne, Ind.—The plans for the $1,000,000 power house of the Ft. Wayne & Wabash Valley Road have arrived and bids for its construction will be opened this week The plans call for the production of 10,000 hp., and when carried out will make the most up-to-date power house in the United States. The turbine engines will rest on a solid base immediately over the boilers.

Lockport, N. Y.—In the test case involving the right of the Niagara, Lockport & Ontario Power Company to build an electrical transmission line from the Niagara River, in addition to constructing a power canal, Justice Kenefick decided in favor of the power company.

Pittsburg, Pa.—The War Department at Washington has granted permission to H. P. Dilworth, Charles Arbuckle Jamison and Stuart Robinson to use the water flowing over the Springdale dam in the Allegheny River for power purposes. A power plant to cost $400,000 will be erected and electricity for lighting and power throughout the Allegheny Valley will be produced. The strong current in the Allegheny induced the Pittsburgers to apply for the right to build a plant.

BIDS WANTED.

Washington, D. C.—The Navy Department, through the Bureau of Supplies and Accounts, is inviting sealed proposals until August 8 for furnishing the Navy Yard at Pensacola, Fla., with the following: Schedule 44, electrical supplies, cable and telephone wire. On August 15 the Bureau will open bids for furnishing Western Navy Yards with the following: Schedule 46, telephone cable; schedule 47, conduit, voltmeters, ammeters, circuit breakers, switches, lights, Grimshaw and Okonite tape, wire, cable and micanite board. Blank proposals and detailed information will be furnished on application to the Bureau at Washington. The Bureau will also receive sealed proposals until August 8 for furnishing Eastern Navy Yards with the following: Schedule 39, electrical conductors, cable, wire, ventilating sets, annunciators, testing sets, cells, etc.; schedule 42, motors. Blank proposals can be obtained at the Navy Pay Office in New York or of the Bureau.

Williamsport, Pa.—Sealed proposals will be received by the light committee of the council of the Borough of South Williamsport, Pa. until August 10, for lighting the streets, alleys, thoroughfares and parks of the borough with the most modern system of electric lighting, every night and all night, for a period of one year; also for a period of three and five years from October 1, 1905. Bids to state the kind and number of lights to be furnished, the system of lighting, the candle power and distribution of lights. Address W. L. Regelman, Chairman Light Committee.

NOTES FOR INVESTORS.

Latest quotations for copper are: Electrolytic, 15¼@15½c.; Lake 15¼@15½c.; casting, 14⅞@15⅛c.

The report is again revived that Metropolitan Street Railway of New York is to be taken over by the Interborough at $150 per share.

It is officially stated that the Electric Storage Battery Company in the last three months earned enough to pay its next two quarterly dividends.

Directors of the New England Telephone & Telegraph Company have declared a regular quarterly dividend of 1½ per cent., payable August 15.

It is said, semi-officially, that the gross earnings of the Brooklyn Rapid Transit Company for July will show a gain over last year of about $200,000.

Notwithstanding the trouble with its employes the United Traction Company of Albany, N. Y., has declared the usual quarterly dividend of 1¼ per cent.

The National Carbon Company has declared the regular quarterly dividend of 1¾ per cent. on its preferred stock, payable August 15. Books close August 5 and reopen August 16.

The industrial dividends for August thus far declared and those yet to come show a gain approximating $1,100,000 over those of August a year ago, the total this year footing up $15,710,529.

Stockholders of the Massachusetts Electric Companies voted to issue $3,500,000 four and one-half per cent. 5-year gold notes to refund a like issue authorized January 1, 1901, of which $2,700,000 are now outstanding.

It is said that Canadian capitalists are seeking investments in Mexico and that a group of Montreal men incorporated the Mexican Electric Light Company with a capital of $6,000,000 and will deal in electric light, heat and power in Mexico.

It is announced that G. Martin Brill, of the J. J. Brill Company of Philadelphia, has consented to act as president of the proposed new combination of street car builders, which will control, it is said, 95 per cent. of the business in this country.

For the purpose of securing its recent $10,000,000 issue of bonds the Portland General Electric Company in Portland, Ore., placed a blanket mortgage on its entire plant for $10,000,000. The mortgage was given to the United States Mortgage & Trust Company of New York.

Thomas E. Mitten, formerly vice-president, has been elected president of the Chicago City Railway Company and Lawrence A. Young has been elected first vice-president. This action is construed to mean that the company will proceed with the rehabilitation of the system.

The recent advance in General Electric was accompanied by a revival of the reports that the company has acquired the Allis-Chalmers property. The purchase of this property was reported to have been made several months ago, but at that time the report was positively denied by all the parties in interest.

The Morris County (N. J.) Traction Company has made a mortgage to the Trust Company of America to secure $3,000,000 five per cent. 30-year bonds, redeemable at 110. The company has $400,000 of its $3,000,000 capital stock outstanding and has already in operation 7½ miles of traction road from Wharton via Dover to Rockaway, N. J. It proposes about 60 miles of additional road through Springfield, Union and Milburn.

EDITORIAL NOTES.

Will the Electric Auto Win Out?

Faithful as he is to the very last, we will not be sorry to see his exit from the city streets. The automobile and auto-truck have marked time for five years, but the experiment has been conducted with satisfaction and the horse must go. But whether his departure will leave behind a definite and specialized solution of the problem, or whether the city streets will remain the scene of a variety of species of "autos" is at first glance a hard proposition to solve. There are three lines of argument represented by an equal classification of machines. The gasoline, steam and electric vehicle are working out their salvations side by side. They are numerous individually and collectively, yet seem to have found, through the influence of experience and observation, their particular fields of service. The gasoline is the ruling element in the contemplation of practical automobile problems. Such of the steam cars as have arisen above the plane of mediocrity in equipment and staying power, in fact, such of these as embrace the necessary features of successful operation belong to second place in this category of functions. And then, belonging to a particular classification, derived as it were from its limited scope, through unlimited possibilities, the electric auto makes its appearance. It is readily understood that limitations in this case belong to the order of temporary events, if any trust can be put in the drift of modern science. It is not a mere matter of speculation to believe in the greater future of electricity in connection with this gigantic problem of street vehicles. The battery turned out by Mr. Edison offers a partial solution of the problem. The weight in this case is less than 45 pounds per horse power with a great element of durability. But whether it be the work of one, or the result of the efforts of many, the idea relates not so much to the details as they appear at present as the hopes that lie in the future. On this score much may be said, by reference to the suggestions of our best electro-chemists. In addition, the great sight-seeing cars are exemplifications of this idea as well. In some of these a complete gasoline electric plant is installed, with the ultimate purpose of securing, as far as the operation of the vehicle is concerned, electric control.

Electric control, therefore, offers the innumerable advantages that make it, in theory and practice, rise far above the efforts made in other directions. Electric control means the elimination of the chauffeur's attention from the mechanism to the road. The levers left to operate with merely consist of the power and guiding handles, the brake being operated by the feet. The electric vehicle, however, is not a perfect machine to-day. It is but justice to admit that the imperfection does not lie in the vehicle as such itself, but in the battery power. The lacking capacity here must be overcome before it assumes pre-eminence. Otherwise it is the acme of perfection to those making short trips, to the proprietors of sight-seeing carryalls and to the owners of heavy slow-moving heavily weighted express or brewery wagons.

* * *

Japan's Great Electric Plants.

The Tokio Shigai Tedsudo, the name of the Tokio Street Railway, is capitalized at fifteen million yen, about seven million five hundred thousand dollars of our money. It is to-day the largest electrical enterprise in Japan, and so far as its future development is concerned, is destined to be the scene of the most extensive, as well as the most rapid expansion in electric railroading in the Orient. While this may not seem to be saying much, it is intensely important, with respect to what has recently been advertised in the public print. And these facts are of such a nature that Japan rises, at one swift bound, to a position second to none if not superior to all European countries, as far as her electrical institutions are concerned. Thirty-seven turbo electric plants have been ordered by Japan, aggregating a total of thirty-five thousand horse power, for use in Tokio and other large cities in her provinces. In lighting capacity the total would equal four hundred thousand lamps. In power equipment it speaks for itself. Electricity is being extensively used in Japan for both street and interior lighting. It finds a large and constantly growing application for many industrial enterprises.

The street railways are forming a complete network under the stimulating influence of American and English capitalists. The networks are connecting town with town, city with city, the suburban with the urban districts. The great coal mines are on the point of undergoing a complete rehabilitation by the introduction of electricity for the drilling, carrying, lighting and ventilating of the mines.

The story of this incomprehensible rise of Japan to a position among the first of the great nations in the utilization of the science and arts of the day, in the assumption of power, in the exhibition of a calm and obvious spirit of justice, in the love of all the intricacies relating to scientific research, in medicine, surgery, industrial fields of occupation and agriculture, in carrying out to fulfillment stupendous tasks with comparative alacrity and ease, reads like a fairy tale.

But when we discover in the manner of giving and handling franchises for public utilities, as in the case of her Tokio Street Railway, that in this instance the franchise provides that after 1932 the municipality may acquire the line by paying an adequate price for it, a certain Utopian spirit seems to appear, in marked contrast with the method prevailing in many other lands. In July, 1904, Japan received news of the first big shipment of turbines to her shores. Since that time American enterprise, more than any other, more even than her ally England, has erected power plants and installed systems that place her among the largest consumers of electrical devices we have. Geographical terms will soon represent less inherent national differences than differences in language or manners. Nippon is an anomaly yielded by no other precedent, and in which we believe the only peril residing, now fast disappearing, is that of ignorance. Buying, as she now is, more freely in the way of the most improved machinery than even her antagonist Russia, it seems that the entire trend of her efforts is to be supermodern, and in this respect, by being modern, she successfully sweeps away the thickly settled dust of antiquity.

If the arts of war make her one of our heaviest customers, the arts of peace will surely surfeit the Yankee ambition for orders as never before.

◆

UNDER THE SEARCHLIGHT.

Notes and Comments on Various Topics.

The eleventh annual convention of the Ohio Electric Light Association will be held at Hotel Victory, Put-in-Bay Island, August 16, 17 and 18. A large number of valuable papers will be presented, and there will be an illustrated lecture on "Illuminating Engineering," W. D. O'Ryan, Lynn, Mass., followed by a banquet. There has been provided, in addition, an elaborate programme for the entertainment of the ladies.

◆

A magnetic survey of the North Pacific Ocean will shortly be begun by the Department of International Research in Terrestrial Magnetism of the Carnegie Institution at Washington. The director of the work is Dr. L. A. Bauer, who likewise is in charge of the magnetic work of of the United States Coast and Geodetic Survey.

◆

A new electric fire and watchman's signal system, for whose installation the last Congress voted $8,500, is soon to be put in operation at the Charlestown Navy Yard. The system, which is practically identical with those being placed in the War, Navy and State Departments and the Public Printing Office at Washington, will be the first to be put into use in any navy yard or naval reservation in the United States.

◆

Among remarkable recent inventions are the pneumoslito, the topodict, the telemeter, the telephone-ears and the thermophile, which are described in the "Strand Magazine." The pneumoslito is an automobile especially designed for use on ice, but which can just as easily be used on land It is moved by a propeller wheel run by a 2¾ hp. electric motor, the propeller turning in the air and moving the carriage at a speed of 20 miles an hour. The topodict is a combination of a pantograph and telescope, by means of which any person can make a drawing in correct perspective of any scene before him, even if he knows nothing whatever of drawing. By means of the telemeter the exact distance of far-away objects can be measured and recorded. The "telephone-ears" is an apparatus by which a ship is automatically warned of submarine dangers. By the aid of the thermophile "it is possible to furnish heat by means of a fine electric wire which can be woven into rugs, blankets or cushions, and all that is required is a very small electric battery. The inventor claims for it that it will do away with the necessity of ever having fires in even the coldest of weather."

◆

The Colorado Electric Light, Power and Railway Association will hold its annual convention at Glenwood Springs September 18 to 20.

◆

A good mixture which will prevent the rusting of machinery, says an English publication, is made by dissolving one ounce of camphor in one pound of melted lard. After the impurities have been skimmed, black lead should be added to give the whole an iron color. After cleaning the machinery carefully and smearing it with the mixture it can be left indefinitely, or if wiped off after 24 hours it will obviate rust for some time. When removed, the metal should be polished with a soft cloth.

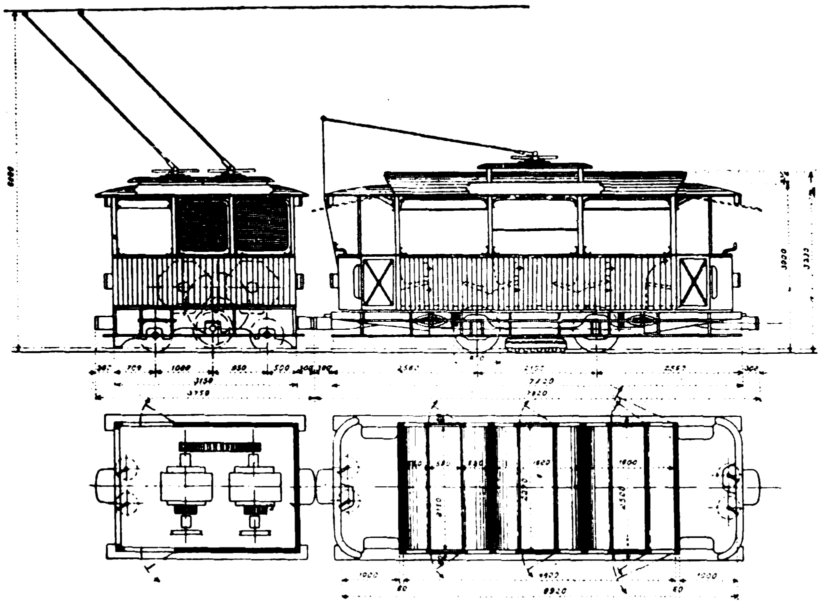
◆

The ozonizing plant of de Frise, erected on the grounds of the St. Maur pumping station near Paris, France, treats filtered water of the River Marne. It is capable of sterilizing 150 cubic meters of water per hour. The necessary power is supplied by a 45 hp. semi-portable steam engine, driving 110-volt Morley alternators and a centrifugal pump. A transformer is used that is capable of raising the pressure to a maximum of 80,000 volts, each ozonizer requiring a pressure above 20,000 volts. An ozonizer consists of a horizontal brass half-cylindrical trough fitted with a plate glass cover and a cast-iron water jacket. The trough is earthed and forms one pole. Across the trough, at regular distances, are brass half-disks, with serrated circular edges, 60 mm. smaller in diameter than the trough. These are fixed to the glass lid by means of screws which bring the high tension current from the liquid resistances fitted to each half-disk. For resistances, vertical glass tubes filled with a suitable liquid are used.

THE MT. VESUVIUS ELECTRIC RAILWAY.

BY FRANK C. PERKINS.

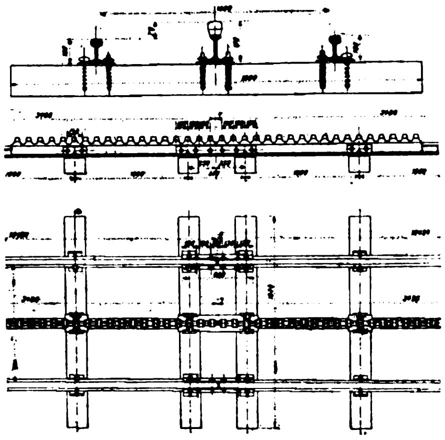
In spite of the fact of the recent eruptions at Mt. Vesuvius, which have caused considerable damage in the vicinity of the volcano, the electric railway is said to be still in daily operation. A cable road was constructed two decades ago for the highest section of the Mt. Vesuvius Electric Railway. Since that time it has carried many thousand tourists to the top of the cone to within several hundred feet of the crater of the volcano. In 1888 the cable section was purchased by Thomas Cook & Son and the electric railway connecting this road with the Pugliano, about 4.7 miles in length, was constructed by them in three sections, two of which are of the adhesion type, while the third, between the two, about one mile in length is of rack and pinion construction.



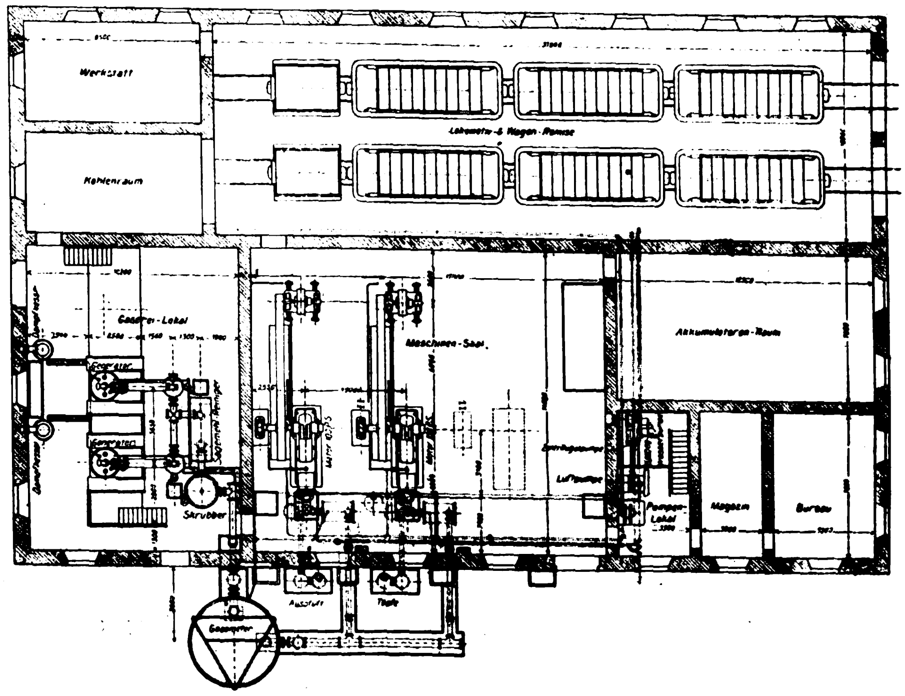
Electric Locomotive and Motor Car on Mt. Vesuvius Electric Railway.

The Strub system was employed, which is similar to the Jungfrau Mountain Electric Railway. At a point 793.6 meters above the sea level the cable line begins and rises to a height of 1,181.26 meters with grades varying from 35 to 65 per cent. The cable cars each carry 21 persons.

Hand brakes were well provided as a complete equipment of automatic brakes for both sets of wheels. About 12,000 persons are carried to the top of this cable line each year, the larger numbers during the months of March and April, the average being for these months more than 2,000 passengers.



"Strub" Rack on Mt. Vesuvius Electric Railway.

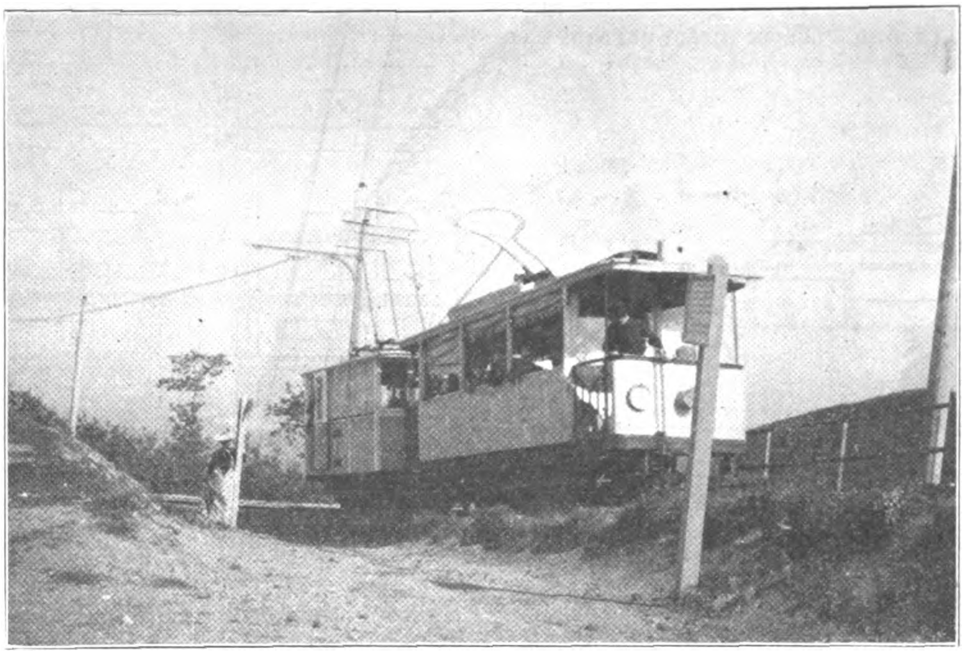


Power House of Mt. Vesuvius Electric Railway.

For supplying current for the Mt. Vesuvius Electric Railway, operating between Pugliano and the lower station of the cable road, an electric generating station was provided at the foot of the rack and pinion section, 249.6 meters above the sea level. The power station is provided with two gas engines constructed by the Schweizerischen Lokomotiv-und Maschinenfabrik of Winterthur, Switzerland. Each of these engines has a normal capacity of 90 hp. and operates a direct current shunt dynamo at a speed of 700 r.p.m. These direct current electric generators were designed for a maximum pressure of 770 volts, and supply a maximum of 137 amperes at a normal pressure of 550 volts. These machines are of the C. E. L. Brown type, having four poles, the magnet poles having a diameter of 250 mm. The armature of each machine is of 550 mm., and has a commutator of 255 segments. The dynamos supply current to a set of storage batteries consisting of 300 cells, which are used for taking care of the peak of the load and for regulation. The gas engines of the four cycle type with a stroke .76 m., and the cylinders measuring .52 m. in diameter. The electric locomotive used on the rack railway and the overhead electric construction of the Mt. Vesuvius Railway were supplied by the Aktien Gesellschaft, Brown, Boveri & Co.

Two motors, each having a capacity of 85 hp. are used on the electric locomotive and they operate at a speed of 700 r. p. m., and are of the four pole type, the magnets having a diameter of 235 mm. The armature of these machines each have a diameter of 450 mm. with 53 slots. The commutator in each case has 105 segments. The rack locomotive weighs somewhat over 10 tons and operates at a speed of from 6 to 8 km. per hour drawing a load of more than 10 tons. The locomotive is provided with emergency as well as hand brakes, together with automatic brakes, which are so arranged that the current is also shut off when the speed exceeds the limit decided upon.

The electric cars each weigh somewhat less than nine tons and are provided with single trucks having two axles, the wheel base measuring 2.1 m. Three compartments are provided for each car which seats eight passengers. The rack and pinion section of the road, which is about one mile in length, has very high grades, much greater than the adhesion sections, which do not exceed 8 per cent., the maximum for the former being about 25 per cent. The rails are fastened to wooden ties, the gauge being 1 meter. The rack rail is located in the center between the running, the height being 170 mm. above the iron plates, and the latter 100 mm. The accompanying diagram shows the rack rail as well as the electric cars, locomotive and power house construction.



Electric Locomotive and Electric Car on Rack Section of Mt. Vesuvius Electric Railway.

The station at Pugliano is 97.17 m. above the sea level and is 1,550 meters from Sanvito which stands 179.6 m. above the sea level. The distance from Sanvito to the central power station, which is at Monte Cateroni, is 1,705 m. The total cost of the Mt. Vesuvius Electric Railway, including the cars, track construction and power house, was about $250,000, or somewhat over $50,000 per mile. The cost of repairs is very high, especially on the upper section of this railway, where deposits of lava have given considerable trouble. A section of the road is shown in the accompanying illustration as well as the curious formation of lava, the mountain slope, and the observatory in the distance. The trip to the top of Mt. Vesuvius is a comparatively safe one, as a great deal of pains has been taken with the brake equipment of the cars and locomotives. It is possible for the motorman on the front of the car to operate the brakes of the locomotive in the rear and signal the engineer when necessary. Telephone communication is also provided between all the stations of the line and the power house.

From the power house to the observatory, which is the rack and pinion section of the road, the distance is 1,641 meters. The total distance from the royal observatory to the Funicular station is 2,695.5 meters, which makes a total length of electric railway of nearly five miles, and the trip over this section of the road takes less than one hour. The central power station was constructed so that the capacity could be increased by installing an additional gas engine and generator, as shown in the accompanying drawing. The engine room measures 17 m. in length and 14.5 m in width, and the gas generator room measures 10.2 m. in width, and 14.2 m. in length. The storage battery room has a width of 7 m. and a length of 12.5 m., while a car barn has been provided in the same building for the electric locomotive and motor cars with double tracks, having a capacity for six cars.

Royal Observatory and Lava Deposits on Mt. Vesuvius Telephone and Power Transmission Line.

The highest mountains of France, Italy and Switzerland, as well as America, are now accessible to the tourist by electrically operated mountain railways. The pleasures of the mountain scenes, formerly only within the reach of the hardy and strong, may now be enjoyed by those who could not exert themselves in the least at these high altitudes.

ELECTRICITY LEAFLETS.

BY NEWTON HARRISON, E. E.

The Transmission of Power.

The Size and Weight of the Power Line.—The cost of the power line forms one part of the expense of its erection. The balance of the expense is discovered in the cost of the undertaking with regard to the poles, insulators, etc. The original law laid down by Lord Kelvin has undergone modification. His statement of the situation from an economic standpoint was as follows: "The interest on the cost of the copper of the line must be equal to the cost of the power wasted in the line." In other words, if the line cost $100,000, the interest at 6 per cent. being $6,000 represented the dollars and cents value of the power that could be wasted in it without overstepping the economic law governing the best conditions of practice. The best conditions of practice, as outlined by the best engineering done in this field, show an expense in the insulation which far exceeded the anticipations of the theorists originally dealing with the subject. Copper and insulation are of greater importance as regards the integrity of the plant and its serviceability for continued power transmission than was formerly believed, because of the extraordinary high pressures employed to secure economical transmission.

The following formulas are recommended by one of the largest electrical manufacturing concerns in the United States. They relate entirely to the questions involved in power transmission, namely:

1—The area of conductors in circular mils.

2—The pounds of copper of conductors.

3—The volts loss in line.

4—The current in the main conductors.

The area of the power line in circular mils is obtained by employing this formula:

Circular mils = D × W × C ÷ p × E^2
in which W = Watts delivered,
D = Distance of transmission in feet (one way),
p = Loss in line in per cent. of power delivered, that is, of W,
E = Voltage between main conductors at receiving or consumers end of the circuit.

The value of C = 2,160 for direct current, when T = 1, B = 1 and A = 6.04. The last symbols refer to characters used in formulas to follow. To obtain the value of the current in the main conductors, a formula of the following simple form is used:

Current in main conductors = W × T ÷ E.

If a power circuit carried a direct current the product of the watts by the value T with division by the pressure would give the total current. When the system is alternating, the value of T is obtained from the table for which it is given for single, two and three-phase currents:

PER CENT. POWER FACTOR,

	100	95	90	85	80
Single phase system, value of T.	1.00	1.05	1.11	1.17	1.25
Two phase system, (four wire), T...	.50	.53	.55	.59	.62
Three phase system (three wire, T	.58	.61	.64	.68	.72

Thus, in the formula W × T ÷ E, if T = 1 for direct current, for single-phase with a power factor of 100 it also equals 1, for two-phase it equals .50 and for three-phase .58. But ideal conditions like these do not exist in power lines except under extraordinary circumstances. When the power factor is 80, the value of T, which is 1 with direct current, becomes respectively 1.25, .62 and .72 with single, two and three phase currents. An illustration of this principle of application can be readily made evident by a case in which it is desirable to know the current in the main conductors with a given amount of power, say 100,000 watts, which is transmitted at a pressure of 10,000 volts by continuous current and single, two and three-phase currents, the power factor for all being 90.

With Direct Current—Current in main conductors equals 100,000 × 1 ÷ 10,000 = 10 amperes.

With Single-phase Current—Current in main conductors = 100,000 × 1.11 ÷ 10,000 = 11.1 amperes.

With Two-phase Currents—Current in main conductors = 100,000 × .55 ÷ 10,000 = 5.5 amperes.

With Three-phase Currents—Current in main conductors = 100,000 × .64 ÷ 10,000 = 6.4 amperes.

The relative values in this case when compared show differences representing the amount of copper necessary for 10 amperes with direct current, 11.1 amperes with single-phase, 5.5 amperes with two-phase and 6.4 amperes with three-phase. The increase in the copper required with single-phase transmission for equal quantities of power is the difference between 11.1 amperes and 10 amperes. The weight of additional copper over a long line would readily prove the disadvantage of this if it were not outweighed by other considerations, such as ready conversion before distribution and comparatively easy handling as regards insulation. A direct high tension current is not practical for power transmission because of the danger in attempting to secure insulation and commutation in direct current motors under these conditions.

The pounds of copper are calculated by the formula:

Pounds of Copper = D^2 × W × C^1 × A ÷ p × E^2 × 1,000,000.

The value of C^1 depends upon the system as well as A. Both are given in the following table, which covers the situation with regard to single, two and three-phase systems:

System.	Values of A.		Per cent. Power Factor 100	95	90	85	80	
Single phase.............	6.04	Values	2,160	2,400	2,660	3,000	3,380	Values
Two-phase (four-wire)...	12.08	of	1,080	1,200	1,330	1,500	1,690	of
Three-phase (three-wire)..	9.06	C^1	1,080	1,200	1,330	1,500	1,690	C^1

In the cases just cited, if the weight of copper for the single-phase system is calculated for a distance of 100,000 feet the result would be as follows, with a 90 per cent. power factor and a 10 per cent. loss.

Pounds of Copper for Single-phase System = 100,000 × 100,000 × 100,000 × 2,660 × 6.04 ÷ 10 × 10,000 × 10,000 × 1,000,000 =

$$\frac{100,000^3 \times 2,660 \times 6.04}{10 \times 10,000^2 \times 10^6} = \frac{10^{15} \times 266 \times 6.04}{10^{14}} = 16,066 \text{ lbs.},$$

where D = 100,000 feet,
W = 100,000 watts,
C^1 = 2,660,
A = 6.04,
p = 10,
E = 10,000 volts.

If the pounds of copper are to be known for a two and three-phase circuit under the same general conditions, an examination of the table will readily show that A for two-phase is 12.08, and C^1 for the same phase with a power factor of 90, has the value 1,330. A further examination will show for three-phase, the value for A of 9.06 and for C^1 with a 90 per cent. power factor 1,330. Arranging the items as before, the following data for calculating the weight in pounds of copper of a two-phase system presents itself:

where D = 100,000 feet,
W = 100,000 watts,
C^1 = 1,330,
A = 12.08,
p = 10,
E = 10,000 volts.

Pounds of Copper for a Two-phase System = $100,000^2$ × 100,000 × 1,330 × 12.08 ÷ 10 × $10,000^2$ × 10^6 =

$$\frac{10^{15} \times 1,330 \times 12.08}{10^{15}} = 16,066 \text{ lbs.}$$

These calculations show no difference in the weight of wire as indicated by the calculation of the current in the main conductors In the single-phase conductor the 100,000 watts called for an 11.1 ampere current at 10,000 volts pressure. In the two-phase system the transmission of the same amount of energy called for four wires, each carrying 5.5 amperes at 10,000 volts pressure. The data supplied in connection with a three-phase system with a power factor of 90 is as follows:

where D = 100,000 feet,
W = 100,000 watts,
C^1 = 1,330,
A = 9.06,
p = 10,
E = 10,000 volts.

Pounds of Copper for a Three-phase System $= 100{,}000^2 \times 100{,}000 \times 1{,}330 \times 9.06 \div 10 \times 10{,}000^2 \times 10^6 =$

$$\frac{10^{15} \times 1{,}330 \times 9.06}{10^{15}} = 12{,}049 \text{ lbs.}$$

The variation in weight occurring through the introduction of a three-phase system suggests the economic reason for its success over other experiments in the same direction. The results show equivalence in weight for a single and two-phase system as stated. The three-phase gives a favorable difference in weight such as that shown by the subtraction of 12,049 lbs. from 16,066 or about 2 tons of copper.

Where three-phase power transmission is a problem of many miles instead of the limited distance of the last examples, a formula is suggested for the pounds weight of copper as follows:

Pounds of Copper $= M^2 \times Kw. \times 300{,}000{,}000 \div p \times E^2$,

where M = the distance of transmission in miles,
Kw. = the total energy delivered in kilowatts.

The power factor is assumed to be approximately 95 per cent.

If, for the purpose of illustrating the application of the formula, the following data is assumed:

M = 100 miles,
Kw. = 10,000,
p = 10,
E = 100,000 volts,

then the weight of copper will equal

$$\frac{100^2 \times 10{,}000 \times 300{,}000{,}000}{10 \times 100{,}000^2} = \frac{10^4 \times 10^4 \times 3 \times 10^8}{10 \times 10^{10}}$$

which $= \dfrac{3 \times 10^{16}}{10^{11}} = 300{,}000$ lbs. of copper.

The Drop in the Line.—This important element must receive consideration as the factor influencing the commercial aspect of the problem of power transmission more than any other. It is, in fact, the question of wasted energy in the line, which governs its cross-section for a given length. The weight is therefore an element governed by distance, only in so far as the energy to be dissipated meets with consideration. The greater the drop the less the weight of copper for a given distance, other things being equal, and the less the drop the greater the weight of copper for a given distance under the same circumstances.

The formula for the volts lost in the power line is as follows:

Volts lost in line = p × E × B ÷ 100, where, as already stated,

p = per cent. loss of power,
E = total pressure of line at the receiving end,
B = 1 for direct current and values for alternating current service, depending upon the size of the wire, frequency of the current and the power factor employed.

As indicated, it is equal to 1 for direct current and where a 100 per cent. power factor is correct for the circuit. In the following tables values are given for wires 18 inches apart. If the difference in phase between the transmitting and receiving end is not very marked, these figures are reliable for values of B. Where the line loss exceeds 20 per cent. and large conductors at 125 cycles are employed the figures will fail. For lower frequencies and less loss they average up correctly; at about 10 per cent. loss the most reliable results may be obtained. With the wires nearer the loss becomes less until, if side by side, only the resistance loss remains:

Values of B.

Size of wire.	60 Cycles. Per cent. Power Factor.				125 Cycles. Per cent. Power Factor.			
	95	90	85	80	95	90	85	80
0000	1.62	1.84	1.99	2.09	2.35	2.86	3.24	3.49
000	1.49	1.66	1.77	1.95	2.08	2.88	2.77	2.94
00	1.34	1.52	1.60	1.66	1.86	2 18	2.4	2.57
0	1.31	1.40	1.46	1.49	1.71	1.96	2.13	2.25
1	1.24	1.30	1.34	1.36	1.56	1.75	1.88	1.97
2	1.18	1 23	1.25	1.26	1.45	1.6	1.7	1.77
3	1.14	1.17	1.18	1.17	1.35	1.46	1.53	1.57
4	1.11	1.12	1.11	1.1	1.27	1.35	1.4	1.43
5	1.08	1.08	1.06	1.04	1.21	1.27	1.3	1.31
6	1.05	1.04	1.02	1.	1.16	1.2	1.21	1.21
7	1.03	1.02	1.	1.	1.12	1.14	1.14	1.13
8	1.02	1.	1.	1.	1.09	1.1	1.09	1.07
9	1.	1.	1.	1.	1.06	1.06	1.04	1.02
10	1.	1.	1.	1.	1.04	1.03	1.	1.

In the following table the value of B for frequencies of 25 and 40 cycles per second are given. Thus the size of wire, the power factor and frequencies of 25, 40, 60 and 125 give an elastic field for choice of data in calculations of power lines.

Values of B.

Size of wire B. & S. Gauge.	Area of wire in circular mils.	Weight of bare wire per 1,000 ft. in lbs.	Resistance of wire per 1000 ft. at 25° C. or 77° Fah. in ohms.	25 Cycles. Per cent. Power Factor.				40 Cycles. Per cent. Power Factor.			
				95	90	85	80	95	90	85	80
0000	212,000	641	0499	1.23	1.29	1.33	1.34	1.52	1.53	1.61	1.67
000	168,000	509	.0628	1.18	1.22	1.24	1.24	1.40	1.41	1.48	1.51
00	133,000	403	.0794	1.14	1.16	1.16	1.16	1.25	1.32	1.35	1.37
0	106,000	320	.0997	1.10	1.11	1.1	1.09	1.19	1.24	1.26	1.26
1	83,500	253	.126	1.07	1.07	1.05	1.03	1.14	1.17	1.18	1.17
2	66,600	202	.159	1.05	1.04	1.02	1.	1.11	1.12	1.12	1.10
3	52,400	159	.202	1.03	1.02	1.	1.	1.07	1.08	1.07	1.05
4	41,600	126	.254	1.02	1.	1.	1.	1.05	1.06	1.03	1.
5	33,100	100	.319	1.	1.	1.	1.	1.03	1.01	1.	1.
6	26,200	79.5	.403	1.	1.	1.	1.	1.02	1.	1.	1.
7	20,700	62.8	.510	1.	1.	1.	1.	1.01	1.	1.	1.
8	16,600	50.4	.635	1.	1.	1.	1.	1.	1.	1.	1.
9	13,000	39.4	.813	1.	1.	1.	1.	1.	1.	1.	1.
10	10,400	31.5	1.01	1.	1.	1.	1.	1.	1.	1.	1.

The above table is reliable with respect to certain assumed conditions of practice. The assumption of conditions can be crystallized in actual construction by making general allowance of, say, a power factor of 95 per cent for incandescent lighting and synchronous motors; 85 per cent. for induction motors and lighting done together, and for induction motors alone about 80 per cent. The value of p in the previous calculations is the percentage of delivered power lost, not the percentage of loss in the generator. The potential E is the pressure at the receiving end of the power line.

THE FUTURE SUPPLY OF INDIA-RUBBER.*

BY H. L. TERRY, F.I.C., A.I.M.M.

That the present high price of india-rubber is a matter of concern to manufacturers and users alike needs no emphasis, and it would be quite superfluous to enlarge upon it. With regard to the future, however, we are largely in the region of hypothesis, and in the presence of such divergent statements as we have made by this or that authority, it is permissible to attempt to review the situation in a concise manner for the benefit of those who may be interested, but whose leisure or technical knowledge does not permit them to undertake the task for themselves. If we put rubber artificially produced by the chemist aside as not coming within the pale of practical politics—whatever may be looked for in the dim and distant future—there are only two sources of supply which come up for serious consideration. One of these is, of course, what nature has provided with a lavish hand in the tropical and sub-tropical regions of our globe; the other the product of the plantations which in rapidly increasing numbers are to be found in Ceylon, the Straits Settlements, Mexico, Central America, etc. It needs no great discernment of mind to see that the interests of those supplying rubber from plantations and from untended nature are not identical, and it behooves us therefore to weigh carefully the arguments put forth by interested persons as to where we must look for the rubber of the future. More especially is this cautionary measure necessitated, owing to the fact that joint stock enterprise is rapidly taking the place of individual effort, and it is quite conceivable that the investing public, as a whole, knows no more about the intricacies of the rubber trade than it does about the stopes and cross-cuts of its gold-mining ventures. Now, in writing about rubber plantations to-day, one is in a very different position to 30, I might in truth say, 10 years ago. What was at one time entirely experimental and gained for its initiators the title of faddists, is now a demonstrated fact, and those who loudly predicted failure have been effectively silenced. This, however, is not the same as saying that financial success is assured for all time, as some would have it, and it will be advisable, therefore, to look into the general situation somewhat closely.

The bulk of the supplies of raw rubber comes to the world's factories from Brazil and the Congo region, the main point with regard to future supplies being that in Brazil. The product is obtained by merely tapping the trees without affecting their vitality, while in Africa the tree, which is a kind of creeper, is cut down and destroyed in the gathering process. It will be recognized then that without replanting it is only a matter of time for total exhaustion in the principal yielding grounds of West Africa; on the other hand, the Hevea braziliensis, which may be named as a typical South American tree, continues to yield year by year, thus requiring practically no oversight or capital outlay. That there is still plenty of this Brazilian rubber, which is of a much higher quality than the African, to be had for the gathering admits of no doubt. The difficulty is to get sufficient labor to gather it in order to keep up with the constantly increasing demand. There can be little doubt that if an unlimited supply of acclimatized labor were available, we should soon see a decline in the high prices now ruling. Mr. Samuel Colt, an American authority, expresses the opinion that American enterprise will, before long, put the raw rubber supply straight as it has overcome in the past other threatened dangers. Still, as far as I am aware, Mr. Colt does not go beyond indicating the road by which we must expect deliverance; he gives no sort of guarantee that the obstacles in the path will be removed in the near future, and it is this absence of more than a hopeful feeling that is buoying up the hopes of those who are investing their money in growing Para rubber in countries where the labor question is not likely to become acute. Of course, progress has been made in augmenting the Brazilian output. It has only taken five years to show a rise from twenty-two thousand tons to thirty thousand tons. Still, there is room for a much greater production, and in face of the limited numbers of the Seringuer, or who can withstand the deadly miasmatic swamps of Brazil, it is a matter of the first importance for present and prospective planters to know if there is any reasonable prospect of Mr. Colt's optimistic forecasts being fulfilled. Not that the planters regard the issue with fear and trembling, for, to judge from some reports which have recently been made public, they are prepared to witness a very considerable reduction in the present selling price with equanimity. Though it is still rather early to arrive at a correct estimate of the profits of rubber planting, it appears to be the fact that, given favorable conditions, the Para rubber tree can be grown in Ceylon and the Straits Settlements at a cost of 2s. per pound of pure rubber. Indeed, one authority gives it as his experience that it can be grown for 1s. 2d. per pound, but this has not, I understand, found general corroboration. Supposing, therefore, that we take the higher figure of cost, it is clear that at the present selling price of Para rubber (5s. 7d. per pound) the profits are very large. Plantation-grown rubber, we may say, fetches a higher price in the market than the product of Brazil on account of its freedom from water. There does not seem to be any ground to suppose that it is intrinsically superior, though some aver that it is. On the contrary, it is quite probable that, owing to the tapping of immature trees, or the effect of climatic conditions which differ from those in Brazil, deterioration may show itself. At present the preparation of the rubber from the latex or milk, is carried out on the plantations under more skillful management than is the case in Brazil, where the gatherers are under no scientific supervision. It is this careful preparation of plantation rubber, and its consequent purity, that has attracted the manufacturers' attention. As I have said, there is no reason to suppose that it is in any way superior to the wild product, and it would seem that any difference is more likely to be on the side of inferiority arising from circumstances, which are as yet but incompletely understood. For instance, the nature of the soil has a good deal to do with the yield of rubber and its quality, and in this connection I am informed by those who know Ceylon well that a good deal of rubber planting is now going on in localities where the soil is quite unsuitable. The tree may grow well enough but will yield rubber deficient in quantity and quality on arriving at maturity. This point, among others, is one which should engage the attention of those whose financial co-operation is invited for the numerous schemes in existence or in process of development. This, however, is only by way of a warning note that, though considerable progress has been made in rubber growing, there are still possible disappointments in store for those who invest even in reputable concerns.

---

*From the "Electrical Review," London.

That plantations laid out on scientific lines, and under good management, will yield a very handsome profit to those who are content to wait seven or eight years for a return upon their capital certainly now seems to be a demonstrated fact, and investors who take the trouble to discriminate between the good and bad schemes brought before their notice should be under no anxiety as to their money. I refer to the necessity of discrimination, because there will undoubtedly in the future, as in the past, be propositions put forward which have but very slight prospects of success, even if such a strong appellation as swindle cannot fairly be used in connection with them.

To revert now to the all-important matter, the selling price, even if a considerable reduction were experienced, it is clear that, at the proved cost of production, a good margin of profit will be available.

Suppose that Mr. Colt's prognostication of American push and energy were realized, and that Brazil yielded up an increased amount of her latent rubber, there is the continually increasing demand to set against this. Except for such purposes as motor tires, where the best rubber is imperative, there is no doubt that the trade is being hindered in its development in other directions by the high prices now ruling. Should a fall, therefore, take place, we should undoubtedly see the demand increase, which would mean a bigger turnover at reduced profits for the planters. On the whole, therefore, although I see no immediate prospect of any fall in price, it is clear that this eventuality can be faced with composure by the planters, provided, of course, that the stated cost of production is strictly accurate and not liable to any increase. A statement recently made at the Colonial Institute, to the effect that rubber planting will yield wealth beyond the dreams of avarice, must, in the light of our present knowledge, be received with a certain amount of caution, but that the outlook for those who get into reputable concerns at first hand is distinctly bright, is an assertion that can be made in all confidence and sincerity.

I have spoken chiefly of Para rubber because it is the planting of this sort which is attracting the greatest attention at the present time. In Mexico and Central America, however, the indigenous tree, the Castilloa, is being extensively planted, and there is no good reason to doubt of satisfactory results being obtained. In this connection it may not be superfluous to say a word as to relative quality. The product of the Castilloa trees is a good rubber, and under cultivation it will, doubtless, command higher values in the market than it has done in the past when prepared by the natives without supervision. At the same time there is no ground for supposing that this rubber will equal Para rubber in price as has been asserted in connection with the flotation of some companies. Exaggerated statements of this sort ought to be refuted as soon as possible, as they can only have the ultimate result of bringing discredit upon the rubber-planting movement generally.

In this brief survey many points of interest have had perforce to be ignored, and not the least of these is the question as to how far the existing high prices are the result of "opportunism" on the part of the importers and brokers. At present the amount of rubber from cultivated sources is not great enough to cause perturbation in the brokers' camps, but without going so far as to predict anything of the sort, one can imagine the occurrence of such a conflict between the producing interests of Brazil and Ceylon which might result in a material drop in prices.

EMERGENCY VALVES.

BY W. H. WAKEMAN.

ARTICLE II.

Although many devices in steam plants that are operated by hand are valuable and do good work, the tendency in all departments is to use automatic appliances as far as practical. A damper in the stack is useful and efficient when constantly watched and operated by hand, so that best results are often secured from it, but it requires the attention of one man almost constantly to do this, therefore it is much better in every way to install an automatic damper regulator which will always be on duty at no expense except the first cost.

Applying this principle to emergency valves, we find it better in many cases to have one that will close automatically, in case of accident requiring it, than to wait for the engineer (or somebody else) to discover the trouble and operate the required device by hand.

Fig. 5 illustrates a valve that is closed instantly in case of accident to the boiler to which it is attached, which causes steam to rush from the header back into the boiler. If a steam pipe bursts, allowing steam to pass into the atmosphere at a very rapid rate, the valve is closed by boiler pressure acting on it.

This valve is now closed, but when steam pressure in the boiler equals or slightly exceeds that in the header it passes through 2 and 3 raising the valve 4 for this purpose. A plunger operates in the dashpot 5 to prevent violent action of the valve, which would injure or destroy it; 6 is a continuation of the valve stem, which in this case is made in three parts. It carries the wheel 7, by means of which the valve is closed by hand whenever necessary; 8 is a steam pipe connection, by means of which pressure is admitted to close the valve, and 9 allows steam to pass to the atmosphere. When pressure accumulates in 10 it acts on the face of the piston, carrying the stem 11 down with it, provided there is little or no pressure in 12.

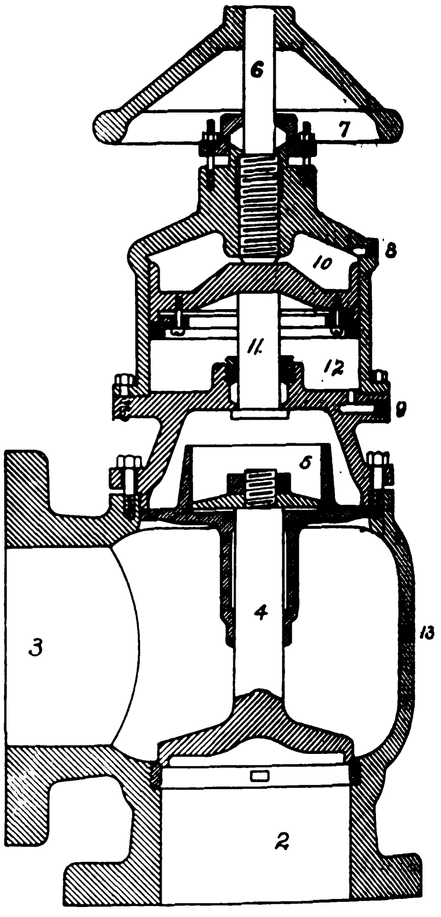

FIG. 5.

The piston carried by 11 is larger than the valve 4, therefore the total pressure on it is greater, making it close quickly. The device which admits steam automatically under given conditions will be presented later on.

Fig. 6 is another emergency valve with special features. Steam passes through 2 and 3 raising the valve 4 for this purpose, but before accomplishing this it must overcome the force exerted by a stout spiral spring, as shown; 5 is only an exhaust chamber, as no dashpot is needed where a spring is employed; 6 is the stem and 7 the wheel, as in previous illustrations. Steam is admitted at 8 to close the valve, while 9 allows steam or water that may have leaked through from 10 to escape, thus preventing pressure from accumulating at this point where it is not needed.

The appliance which admits steam automatically to the valves, shown in Figs. 5 and 6, is called a pilot valve. It is illustrated in Fig. 7. A spiral spring 2 is adjusted to operate against any desired pressure, and when so adjusted it holds a valve ready to open when required. Steam from the boiler enters the pipe 3 but can go no further under normal conditions. The small pipe 4 is connected to 13 in either Fig. 5 or 6, admitting steam from the main valve in either case to the diaphragm 5, Fig. 7, and so long as full pressure is maintained here the whole remains inoperative, but in case a steam pipe bursts, or the engine races badly, pressure in the header will be reduced by the rapid flow of steam. As soon as the pressure is lowered at 5 it can no longer resist the tension of spring 2, hence it at once opens a valve which admits steam from the boiler coming through 3 and passing out at 6 into 8 in Fig. 5 and 6, and as it here operates on a piston, which is larger in diameter than the main valve 4 below it, in both cases the flow of steam in either direction is immediately cut off.

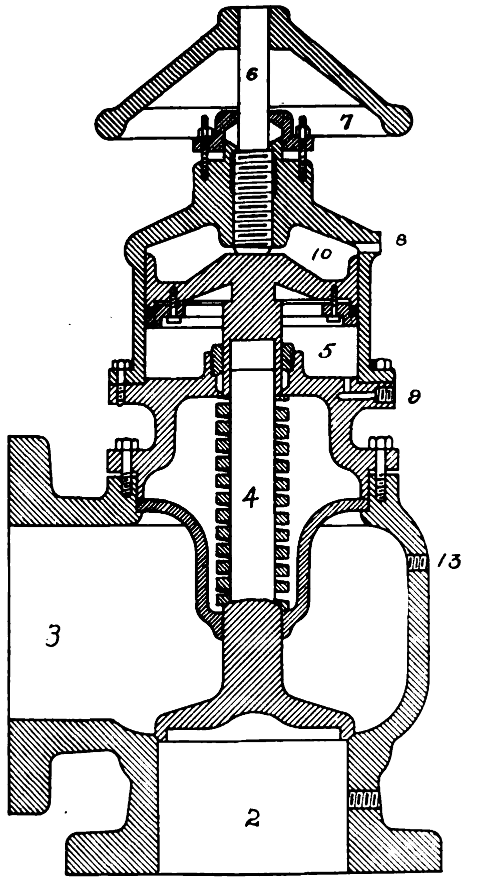

Fig. 6.

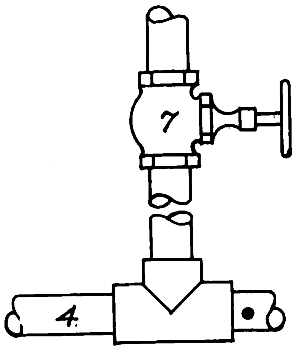
The valve 7, Fig. 7, is for the purpose of trying the apparatus at any time to show that it is in good working order, for when this valve is opened it lowers the pressure at 5 causing the main valve to be closed as above described.

The operation of a valve fitted with a spiral spring, see Fig. 6, and the purpose of its use, needs special mention as interesting principles are involved. Suppose that this spring is strong enough to resist 25 pounds pressure per square inch acting on the face of the valve. Assume that there is no pressure either in the boiler or in the header. In this case there must be a trifle more than 25 pounds at 2 before any steam will pass into 3. This difference in pressure will always exist under fair conditions, regardless of the boiler pressure.



This naturally leads to an inquiry concerning the object sought in generating steam at a high pressure and then reducing it for use in the engine. It is a well-known fact that superheated steam is much more efficient in the cylinder of an engine than a mixture of steam and water, such as we get when a boiler primes. Priming and foaming should not be taken to mean the same thing in this connection, as they do not, for priming may go on every hour that the boiler is used without attracting special attention, for it consists of fine particles of water suspended in the steam and carried over with it to the engine.

If this mixture at 125 pounds pressure comes through 2 meeting the valve 4 which reduces the pressure to 100 pounds, the same amount of heat is contained in each pound weight of steam at the lower pressure in 3 that was present when it left the boiler, but it appears in different form.

Under natural conditions the temperature of steam corresponds to its pressure, therefore if the latter is 125 pounds by the gauge the temperature is 352 degrees. As this passes through the valve and is reduced to 100 pounds, it is not changed to 338 degrees, which is the corresponding temperature, except in some special cases, because there is nothing provided to absorb this heat, therefore it passes through the valve.

The form it takes after this passage will depend on the condition of steam as generated. If it contains no water in suspension, the difference between the two temperatures above mentioned, or 352 — 338 = 14 degrees goes to superheat the steam. If we now proceed to take one pound in weight of the steam just passing and consider the resulting action, it will simplify matters as we shall then have fourteen heat units as the basis for calculation.

When considering this matter it is well to remember that a heat unit is the amount of heat required to raise one pound of water one degree in temperature, also that the specific heat of steam is the amount of heat required to raise one pound of steam one degree, taking a heat unit as a basis for comparison.

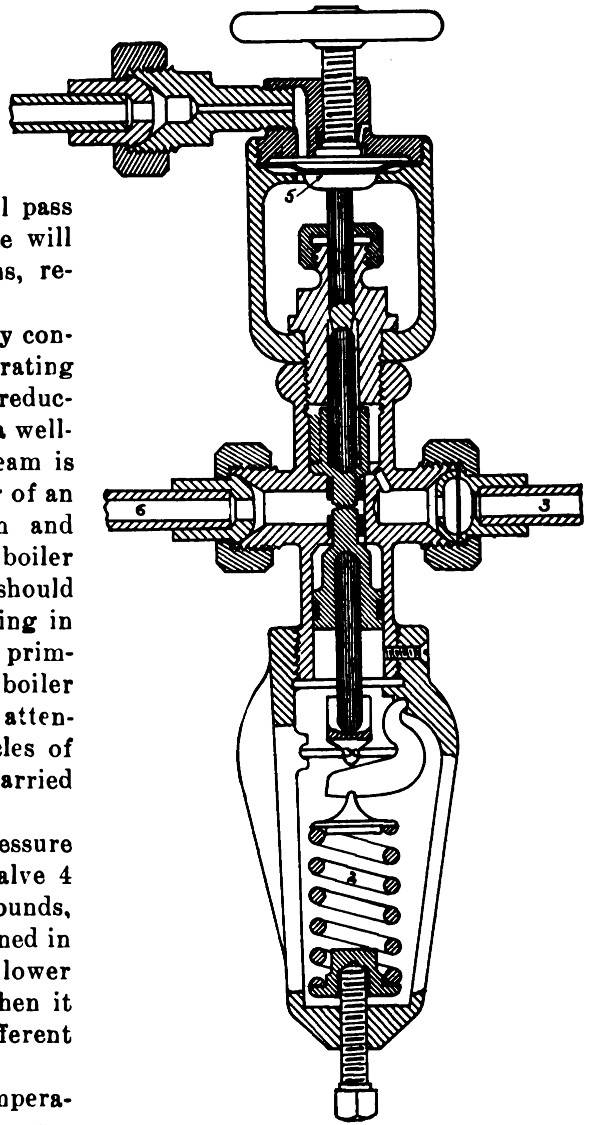


Fig. 7.

Now the specific heat of steam is practically .5, therefore every heat unit that passes the valve, above the natural heat of steam at the reduced pressure raises one pound of the latter two degrees. Taking this into consideration we see that steam after passing the valve has a temperature of 338 + (14 × 2) = 366 degrees, provided none is lost by radiation.

Steam as it comes to the valve may contain water as before mentioned, in which case the fourteen heat units will be utilized in evaporating this water, delivering drier steam to the engine than would otherwise be secured.

If these fourteen heat units are just sufficient to evaporate this water then the steam at reduced pressure will have a temperature of 338 degrees, which constitutes one of the special cases above referred to.

In these calculations fractions are omitted as the results thus obtained are sufficiently accurate to serve as illustrations.

The spiral spring in Fig. 6 makes it impossible for steam to pass into the boiler under any conditions.

WRINKLES.*

EDITED BY H. C. ABELL.

Method of Using One Telephone on Two Floors.

Several years ago our company was paying for two telephones, one up-stairs and one down-stairs. During the daytime the down-stairs telephone was seldom used. I made a box extending from the first floor to the second floor, and in this box I placed the up-stairs telephone, arranging it so it could be raised or lowered something like a dumb-waiter. The telephone wires were connected to two brass rods, which extended from the first to the second floor in the box, and connection was made from these rods to the telephone through sliding contacts which were open-arc lamp carbon brushes. A counter weight was attached. During the daytime the telephone would be at the top, and used in the office on the second floor. At night the telephone would be pulled down-stairs and used there. This has been used for a number of years, and saves the company $75 a year.

F. ELLWOOD SMITH,
Somerville, Mass.

Signal Device for Long-Distance Transmissions.

In long-distance transmission work it is essential that the power house and substation should always be in communication, the one with the other. Experience has taught us that the telephone is not always reliable, so a signal device has been arranged in order that in the event of one of the telephone lines being down the operators in the power house and substation can exchange messages by using a code of signals. The sketch of connections herewith will probably make this clear to your readers.

At the substation end there is a small single-phase induction motor direct connected to a direct current generator, .25 kw. capacity, wound for 110 volts, as shown by A in diagram. The terminals of this generator are connected to ground and to binding post 1 of telegraph relay B. As shown in detail drawing of B, this binding post is connected through the relay coils n and o in series, to the two coils m and p, which are connected to the line terminals 2 and 3. Binding posts 4 and 5 are connected to the local gong circuit. We have the same arrangement at the hydraulic station, except that the binding post 1 of relay is connected straight to ground through contact a^1, forming return circuit to generator A.

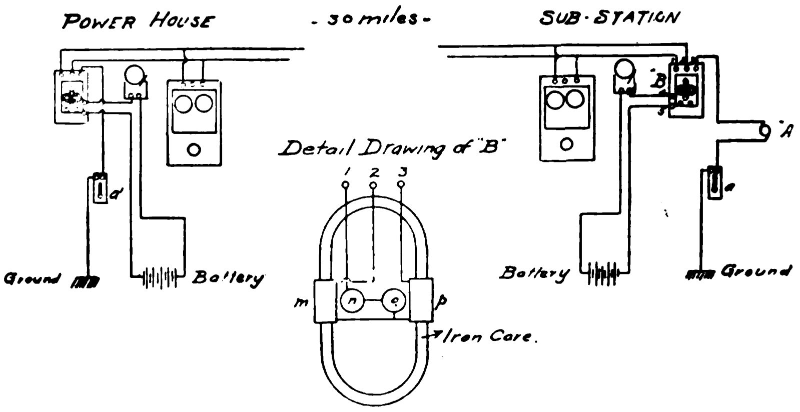

DIAGRAM.

When contacts a and a^1 are closed causing current to pass through the coils of relays, the magnets are attracted, and hold lever arm of relay down. If the operator in the substation or power house wants to signal he opens the ground circuit at a or a^1. The magnets then release the relay arm, which, in turn, short-circuits binding posts 4 and 5, thus closing the local gong circuit. As long as either of these contacts a or a^1 are open the bell will continue to ring. By combinations of short and long rings, corresponding to dots and dashes, we have arranged a code of signals that answers the purpose very well when we have trouble with the telephone.

G. A. MONTGOMERY, Montgomery, Ala.

Telephone Signal.

It is not always possible, when there is much noise in a station to hear the telephone bell, so a central station drop has been arranged in shunt with the telephone box. When the drop is down a circuit with a red lamp is completed. By making the proper arrangement when the drop is down, the drop-ringer is thrown out of circuit and the telephone is thrown in.

H. C. GRAY.

Inductive Effect on Telephone Line in Long-Distance Transmission Work.

We have experienced considerable trouble on our private telephone line between the substation and the power house.

Originally the line was run on brackets spaced about 6 feet below the transmission line, with running transposition between every two poles. The wire on top at one transposition would be under at the next. At times it was very difficult to hear any conversation over the line. This trouble was remedied to a large extent by running the line on two-pin cross-arms and transposing at every fourth pole. The transposition was made on an insulator for that purpose, first on one side of the line end then on the other. The wire that was above the other at the first transposition is always kept on top. That is, every time the line is transposed we find the same wire on the upper groove of the insulator. This method of transposition was found to be a big improvement over the old method, as we can now hear very distinctly over the new line.

Brushing Horses by Electricity.

The great agricultural exhibition which is being held in Munich this summer is one of the most representative shows which has ever been organized in Germany, says a foreign paper. The most up-to-date inventions and machinery are to be seen in every department, and quite one of the most interesting has its place among the veterinary exhibits, where equine health and comfort are lavishly catered for by a well-known Berlin firm. Here your horse can have its coat brushed by electricity. This is done by means of an inclosed revolving brush on the same system as the patent sweepers used for carpets. It is, however, worked by an electric current and thoroughly cleanses the animal's coat of all dust and dirt in less than a quarter of the time employed in the old method.

---

*Paper presented before the National Electric Light Association at its 28th convention, held at Denver-Colorado Springs, Col., June 6-11 1905.

BRITISH SCIENTISTS IN SOUTH AFRICA.

(From our London Correspondent.)

On July 22 and 29 there sailed from England bound for Cape Town a large number of scientists and engineers for the annual meetings of the British Association for the Advancement of Science.

The Congress will open with the first part of Prof. G. H. Darwin's presidential address at Cape Town on August 16. The meetings will continue at Johannesburg and Durban. The second half of the president's address will be delivered at Johannesburg on August 28, the subject being "Evolution." Several days will be devoted to the reading of papers and lectures at each place, and the following are some of the electrical topics which are to be discussed:

There will be a lecture by Prof. W. E. Ayrton, of London, on "Distribution of Power;" one by Sir William Crookes on "Diamonds;" and one by Prof. Porter, of McGill University, Montreal, on "The Bearing of Engineering on Mining." The papers promised include:

"To What Extent Can the Ether Affect the Motion of Matter?" by Prof. Larmor.

"Radiation at Low Temperatures," by Dr. J. T. Bottomley.

"The Leak of Electricity from Certain Heated Substances," by Prof. Beattie.

"Observations of Atmospheric Electricity in South Africa," by Dr. J. T. Bottomley and Mr. Lyle.

"The Teaching of Elementary Mathematics" (discussion) and "The Teaching of Elementary Mechanics" (paper by Prof. Perry).

"The Experimental Foundation of the Theory of Heat Conduction," by Dr. C. H. Lees.

"Magnetic Survey of South Africa" and "Electrical Conductivity in Relation to Chemical Action," by Prof. Beattie.

"Form of Dry Daniell Cell," by Mr. J. Brown.

"On Flight," by Prof. G. H. Bryan.

In the proceedings of the Engineering Section no large space will be given to electrical matters. Mining will naturally be the chief subject, and irrigation will be the text of Sir Colin Scott Moncrieff's presidential address to the section. Roller bearings, automobiles, turbines and the new railway bridge over the Zambezi at Victoria Falls are in the list of topics.

The Victoria Falls, whose utilization for electrical transmission is one of the great works which will be soon undertaken in connection with the development of South Africa, will be visited by large parties of the British visitors. The reading of papers and traveling about from place to place are expected to occupy some 35 days or thereabouts, and the voyage out from England and home again makes a total of 70 days.

The number of visitors from English shores is about 400. Members of the South African Association for the Advancement of Science will join them in the proccedings.

Proposals Invited.

Sealed proposals are invited until September 30 for furnishing all material, labor and other appliances, and erecting and putting in operation, in a building and foundations to be provided by the United States, a complete heating, lighting and power plant, including machinery, boilers, piping, electrical transmission, cables and conduit, appliances and all other equipment in said building. The necessary plans showing the general layout, and complete information and specifications, will be furnished responsible intending bidders on receipt of a certified check for $50, payable to the order of Elliott Woods, superintendent United States Capitol, Washington, D. C.

The Bureau of Supplies and Accounts of the Navy Department is inviting sealed proposals until August 22 for furnishing Eastern Navy Yards with the following electrical material: Schedule 62, incandescent lamps, carbons, insulating tape, wire, lamp cord, testing set, wattmeters and miscellaneous electrical supplies; schedule 63, generating set, wire, cable, cells, electrical supplies; schedule 64, conductor cable, testing magnetos, supply boxes. Blank proposals can be obtained at the Navy Pay Office in New York or on application to the Bureau at Washington. The Bureau is also inviting sealed proposals until September 5 for furnishing the Mare Island and Puget Sound, Wash., Navy Yards with the following: Schedule 58, dry cells, insulators, generating sets. Blank propssals will be furnished on application to the Bureau. On August 29 the Bureau will open bids for furnishing the Pensacola Navy Yard with the following: Schedule 69, electrical supplies; schedule 70, incandescent lamps. Blank proposals can be obtained on application to the Bureau,

ELECTRICAL PATENT RECORD.

LETTERS PATENT ISSUED AUGUST 1, 1905.

Electric Railways and Appliances.

796,188. Trolley-Wheel Bushing. Fred M. Carroll New Haven, Conn., assignor to the H. B. Ives Company, same place. Filed March 20, 1905.

Electric Lights and Appliances.

795,867. Electric Hand-Lamp. Herman F. Stakelbeck Philadelphia, Pa. Filed Dec. 16, 1904.

Electrical Machinery and Apparatus.

795,838. Asynchronous Electric Motor. Paul Jigouzo Vanves, France. Filed Dec. 1, 1902.

795,861. Alternating-Current Induction Motor. Leo Schuler, St. Louis, Mo. Filed July 16, 1904.

795,862. Power Transmission in Self-Propelled Vehicles or Vessels. Charles S. Schultz, London, Eng. Filed Jan. 15, 1904.

795,888. Attachment for Transmitters. Sidney A. Beyland, Elyria, O., assignor to the Dean Electric Company, same place. Filed July 20, 1904.

795,958. Controller for Electric Circuits. Fred Cedergren, Chicago, Ill., assignor of one-half to Frank S. Betz, same place. Filed Dec. 17, 1904.

796,031 to 796,069. Electrical Measuring Instrument Electric Meter, Meter, Indicating Instrument, Automatic Switch for Storage Batteries and Three-Wire Meter. Thomas Duncan, Chicago, Ill., and Lafayette, Ind. First patent filed June 26, 1901. Last renewal Jan. 7, 1905.

796,100. Electric Cable. Charles E. Wilson, Philadelphia, Pa. Filed April 8, 1903.

796,360. Electric Switch. Joseph H. Rusby, Nutley, N. J. Filed June 1, 1904.

796,368. Motor-Meter. Charles P. Steinmetz, Schenectady, N. Y., assignor to the General Electric Company. Filed Nov. 21, 1896.

Telephones and Telephone Apparatus.

795,872. Telephone-Exchange. Harry G. Webster, Chicago, Ill., assignor to Milo G. Kellogg, same place. Filed Nov. 16, 1904.

795,961. Telephone-Exchange System. Elmer R. Corwin, Chicago, Ill. Filed Sept. 3, 1904.

796,022. Cut-out for Telephones. John A. Tornquist, Clinton, Ia., assignor to the Tornquist Electrical Manufacturing Company, Davenport, Ia. Filed Oct. 6, 1904.

796,089. Telephone-Exchange Apparatus. Elias E. Ries, New York City. Filed May 20, 1904.

Miscellaneous.

795,820. System for the Selection of Electric Circuits. Anson G. Cox, Boston, Mass., assignor to Spencer W. Richardson and Richard P. Elliott, trustees. Filed Jan. 27, 1902.

795,821. Underground Conduit. Henry T. Craven, Vineland, N. J. Filed May 24, 1904.

795,836. Selective Call Apparatus. John A. Hulit, Topeka, Kan. Filed Sept. 3, 1904.

795,843. Syntonic Space Telegraphy. Oliver J. Lodge, Birmingham, and Alexander Muirhead, Shortlands, Eng. Filed March 21, 1902.

795,851. System for Selecting Electrical Circuits. Albert D. Neal, South Boston, Mass., assignor to Spencer W. Richardson and Richard P. Elliott, trustees Filed Oct. 18, 1901.

795,852. Electrical Relay. Albert D. Neal, South Boston, Mass.; Emily S. Neal administratrix of said Albert D. Neal, deceased. Filed March 4, 1902.

795,857. Method and Means of Signaling. Frank W. Prentice, Braddock, Pa., assignor, by direct and mesne assignments, of one-half to H. C. Rehn, Cleveland, O., and George D. Breck, Pittsburg, Pa. Filed Nov. 19, 1902.

795,887. Electrolytically Refining Silver. Anson G. Betts, Troy, N. Y. Filed March 8, 1905.

795,956. Process of Electrically Heating Water and Other Liquids. Eugene A. Byrnes, Washington, D. C. Filed Dec. 10, 1904.

796,011-012. Apparatus for and Method of Electrostatic Separation. Greenleaf W. Pickard, Boston, Mass., assignor to Charles Henry Huff, Brockton, Mass. Filed Aug. 2 and Nov. 12, 1904.

796,114. Electrotherapeutic Apparatus. Herschel E. Currey, Baker City, Ore Filed June 14, 1905.

796,241. Electrically-Energized Fence. Albert D. McNair, Dallas, Tex. Filed Nov. 4, 1904.

796,259. Electromagnetically-Operated Reciprocating Tool. Harry S. Sherman, Denver, Col, Filed April 22, 1904.

796,349. Electrical Ignition Apparatus for Internal-Combustion Engines. Arthur J. Postans, South Kensington, Eng. Filed Oct. 19, 1903.

796,403. Electric-Wave-Telegraph Receiver. Charles L. Fortier, Milwaukee, Wis. Filed April 17, 1903.

THE TELEPHONE WORLD.

Good Financial Report for Indèpendent Company.

The recently issued financial statement of the Monmouth, Ill., Independent Telephone Company shows a very creditable financial year. In addition to paying in full the current expenses of the year, the company has paid interest on bonds amounting to $1,482, and has created a sinking fund for the redemption of the bonds, in which there has been deposited $948.48, out of which six treasury bonds have been redeemed and canceled.

The report shows a gain of $1,778.50 in the amount of receipts over those of last year, or a gain of $1,376.51, equal to 16½ per cent. in the rent receipts, and a gain of $358.05 in the toll receipts, equal to 21¼ per cent.

A toll line is being built to Burlington which will be complete by the last of the summer. Last year 998 telephones were being operated. This year 1,181 are in operation, net gain of 183—166 in the city and 17 in the country. There are 877 subscribers in the city, 188 of these being in offices and 689 residences. There are 304 county subscribers.

Farmers to Build Telephone Line.

Farmers and business men in the northwestern section of Lancaster County, Pa., have organized the Mastersonville Telephone Company, which will operate an Independent line through three or four townships and extend into Lebanon County. The headquarters will be at Mastersonville. Several hundred subscribers, principally farmers, have been secured. This is the third Independent telephone line to be established in that county by the farming interests and all of them are proving profitable investments.

With the completion of the Independent telephone system in Council Bluffs, the Independent companies will secure connection from Iowa to Nebraska, which will allow them to compete on heretofore Bell territory. The Iowa lines have been built within a few miles of Council Bluffs, but there they were forced to stop, and no interstate connections with Nebraska have been possible on account of this seemingly insignificant gap.

S. H. Woodson, president of the Independence, Mo., Home Telephone Company, has denied the rumor published in an Independence paper that his company had sold the plant to the Bell telephone interests. He said that no negotiations were on with the Bell people and that the plant would never be sold to that company.

Charles R. Lackey and John S. Lawrence have purchased the Globe Telephone Company's franchise, wires, etc., at Cadiz, Ky., and will install a new plant without delay. The telephone plant at Cadiz was destroyed by fire several months ago, and since that time Cadiz has been without the use of telephones.

Directors of the Norman County, Minn., Telephone Company are contemplating the purchase of the Ada, Halstad, Shelly and Twin Valley lines. The Iron Range Company has offered these lines for $9,000. Another meeting of the former company will be held, when something definite will be decided.

Keystone Telephone Company's Plans.

Elaborate plans are contemplated by the Keystone Telephone Company for the rapid extension of its system throughout Philadelphia, Pa. The improvements have been made possible through the fact that the company has available cash assets of $750,000, the balance of the recent issue of $4,000,000 first mortgage 5 per cent. gold bonds, by which the company's whole floating indebtedness was cleared off.

Already the work of laying conduits and installing cables has been begun in the northwestern part of that city, representing a territory which the company hitherto has not penetrated. It is estimated that the total cost of the work will be about $125,000.

The company proposes also to extend its system in West Philadelphia, and toward that end has already begun enlargement of its West Philadelphia switchboards and service lines at a probable cost of $30,000. The company now owns six telephone exchange buildings, having an ultimate switchboard capacity of 24,200 lines, of which capacity 16,520 lines have been installed, that serve more than 17,000 telephones. Its present conduit system, located in 229 miles of streets, has a total capacity of 10,522,454 duct feet, and is now being added to daily.

The local telephone company of Humboldt, Neb., is having a number of new cables put in through the business section of that city, as the service has extended to such limits that the poles are unable to bear the weight of additional wires needed. The system is being practically rebuilt.

The members of the Belvidere, Ill., Telephone Company, who some time ago signified their intention of rebuilding the entire system, have commenced work, and when finished will have that city equipped with one of the most up-to-date systems in that section.

Recent news from Doylestown, Pa., states that residents of Nockamixon Township have formed a telephone company with the following officers: President, William C. Ealer; secretary, Thomas L. Henry; treasurer, T. M. Moyer; agent, Dr. G. F. Grim.

Articles of incorporation of the Hickman, Neb., Telephone Company were lately filed with the county clerk. The incorporators are: Adam Brendle, J. F. Judah, C. L. Morrison, Henry Diesel, A. E. VanBurg, E. B. Sinker, R. H. Sawyer, Charles H. Hempel and August Schmutte. The capital stock is fixed at $6,000.

The Red Line Mutual Telephone Company of Kansas has accepted the incorporation laws of Nebraska and filed an acknowledgment of the same with the Secretary of State.

The action of the common council of Auburn, N. Y., in turning down the proposition of the Empire Telephone Company, indicates that the subway, which is very much needed, will be constructed by the city.

There are now 37,664 telephones in Kansas, an increase of almost 10,000 in a year.

Independent Company Busy.

The Atlantic Telephone Company, recently organized under the laws of the State of New York, has a present capital of $5,000,000. Its authorized capital is $25,000,000, and the directors of the company have also authorized the issuing of bonds to the amount of $15,000,000. All of the financial plans of the company have been perfected. It is the intention of the company to install an Independent telephone system in Greater New York, and to connect this system with the other Independent companies of the country.

One of the directors of the company said that there was little doubt of the company being granted a franchise. He stated that the company had at present contracts for 75,000 telephones in New York City. The rates for interborough connection will be 5 cents a call, and the company will install 'phones without any guarantee from the subscriber. It also offers to furnish unlimited service in residences for $66 a year, and unlimited business service for business purposes $108 per year.

According to the authority above quoted, the company hopes to install 200,000 telephones in Greater New York, and of these it is stated that 50,000 will be in Brooklyn. The company controls an automatic telephone device which does away with telephone operators and has been found very successful throughout the West. It is planned to establish about 20 central stations in Greater New York and of these five will be in Brooklyn.

Telephone Lines for Rural Districts.

That the farmers of Wicomico County, Md., are progressive, has been shown by the business-like manner in which they have taken up the proposition of the Diamond State Telephone Company to give country subscribers telephone service. This movement on the part of the telephone company is meeting with the hearty approval of the merchants of Salisbury as well as the residents of the rural districts, as it places the farmer and the city merchant in close communication with each other, and enables the farmer to transact his business in town over the wires when he is too busy to drive in, and in this way saving him considerable time.

Although the farmers have long realized the value of telephone service, it has been almost impossible for them to have telephones in their residences, owing to the high rate which the company was obliged to charge for a single party line to a country subscriber. But a new system of rates has been arranged by which a country subscriber can be connected on a party line, and the annual rate is divided equally among the number of subscribers on the line, the rate depending entirely on the number of miles that the line is extended from the nearest central office. This brings telephone service within the reach of every farmer.

The Washtenaw Home Telephone Company has opened its new exchange in Ypsilanti, Mich., using the signal battery light system and the automatic cut-off.

The Cameron, W. Va., Telephone Company is to extend its lines to Moundsville.

GENERAL ELECTRICAL NEWS.

LIGHTING.

Alexandria, Pa.—This place is to have electric lights, the borough having granted a franchise to Wallace Wilson and his associates to erect the necessary poles and string the wires to carry their current for electric lighting and power. The same company will furnish electric light and power to Petersburg. Tyrone capital is interested in the enterprise.

Ashland, Ore.—This city has voted to issue $50,000 of bonds for an electric light plant.

Bellefontaine, O.—This city is equipping a new electric light plant.

Clarksville, Tenn.—The Consumers' Electric Light & Power Company has applied for a franchise to construct an electric light and power plant.

Decorah, Ia.—A special election will be held here August 15, to vote on the granting of a franchise to the Decorah Electric Light Company.

Ensley, Ala.—About 80 of the leading citizens met in a recent mass meeting at the city hall, and voted unanimously for the erection of an electric lighting plant by the city.

Escanaba, Mich.—The municipal electric lighting plant has again been made an issue here. Some $70,000 has been put into the venture, but the plant continues to lose money.

Grand Rapids, Mich.—The city authorities have been requested to open negotiations for the lease of the municipal electric lighting plant to a syndicate of Eastern capitalists.

Manito, Ill.—There is some talk of having an electric light plant here. A promoter has recently been here looking into the matter.

Matthews, Ind.—Charles Sampson will install an electric light plant here.

Olympia, Wash.—Negotiations have been started between the State Board of Control and the Northwest Gas & Electric Company of Walla Walla for supplying the State penitentiary with light and power.

Racine, Wis.—The common council has abandoned the plan of building a municipal electric light plant, and decided to enter into a five-year contract with the Milwaukee Electric Railway Company for street lighting.

Reading, Pa.—On August 17 application will be made to Governor Pennypacker by Wagner Leidy for a charter for the incorporation of a new company to be known as the Cumru Township Electric Light, Heat & Power Company. The incorporators named in the application are William F. Krick, Henry H. Vose and George W. Wagner. The plant will be located at Sinking Spring, and feed wires will be erected to Shillington and vicinity. Work will be commenced as soon as the charter is granted.

Shreveport, La.—The Shreveport Gas, Electric Light & Power Company has completed arrangements for an additional $500,000 bond issue.

Sumas, Wash.—The city council has granted a franchise to H. W. Vanderhoof, of Portland, Ore., for the construction of an electric lighting system.

Sumner, Ia.—Leon Stewart, of Omaha, has been granted a franchise to operate an electric light plant here.

Tacoma, Wash.—The electric lighting service here is to be improved in anticipation of the heavy demand that will be made upon the plant during the winter months.

STREET RAILWAYS.

Carlinville, Ill.—There is to be another electric railway operating between Jerseyville, this city and Alton, to be known as the Carlinville, Alton & St. Louis Railway, with principal offices in Jerseyville.. The incorporators and first board of directors are: Andrew W. Cross, Joseph M. Page, Joseph W. Becker and John McGrath, all of Jerseyville; Aaron C. Anton, of Chicago, Robert Curdie and June M. Rhoads, of Alton.

Chicago, Ill.—McHenry County has good prospects of having an electric road built to McHenry from this city. This road will be built by the recently incorporated Illinois & Wisconsin Railway Company, with a capital of $10,000, and its principal office here.

Erie, Pa.—A new trolley line is projected to connect this city with Edinboro, Cambridge Springs, Union City and Corry, and 1,000 men will soon be busy grading and laying rails.

Fort Wayne, Ind.—The Muncie, Ft. Wayne & Bluffton Interurban Railway Company has been granted a franchise into this city.

Hartford, Conn.—Announcement has been made that within a month work will begin on the construction of an electric railroad between Worcester and this city, to be known as the Hartford & Worcester Street Railroad. The railroad will be built and managed by the same interests which control the Boston & Worcester Street Railway, and will form practically a continuous line from Boston to this city. The cost of the system will be about $3,000,000,

Kankakee, Ill.—The Kankakee electric street railway system and electric park were lately sold to a syndicate consisting of E. D. Risser, of Paxton, R. A. McCracken and others.

Kenosha, Wis.—The Kenosha Electric Railway Company is planning to build a spur track to connect with the line now being built by the Chicago & Milwaukee Railway Company, and it is expected that the people can travel from this city to Chicago by trolley before the first of next year.

Knoxville, Tenn.—The Knoxville Traction Company has introduced into this city an electric signal system.

Lockport, N. Y.—The Niagara Falls & Lockport Electric Railway Company has been incorporated with a capital of $200,000 to build a road connecting by the most direct trolley route Niagara Falls and this city. The proposed trolley line will be about 20 miles long. The directors include a number of well known men of Buffalo, namely: Edward Michael, Clark L. Ingham, W. D Ingham, Elgood C. Lufkin, Isadore Michael and John M. Bradford, also S. P. Franchot, William P. Baker and James S. Simmons, of Niagara Falls.

Maysville, Ky.—Articles of incorporation of the Maysville, Carlisle, Millersburg and Paris Traction Company have been filed in the Mason County Clerk's office here. The capital stock is $30,000, and has all been subscribed. The company is limited to the issuing of bonds to the amount of $1,500,000.

Owensboro, Ky.—Indications are that the long-talked-of electric railroad from here to Calhoon and Hartford is about to be built.

Rockford, Ill.—It has become known through engineering circles that an electric road is coming into this city from the South.

Shawnee, Okla.—The Oklahoma Electric Railway Company, with $250,000 capital, has been incorporated for the purpose of building an electric line from Tecumseh to connect with the Shawnee Traction Company's lines.

St. Clairsville, O.—The franchise for the Wheeling Traction Company's river line has at last been granted.

Warren, O.—The Youngstown & Ohio River Traction Company, which was promoted two years ago by Max P. Good and some other Cleveland people, will build an electric road.

Wooster, O.—The Wooster-Mansfield trolley line will soon be built. The necessary bonds are nearly subscribed, and when a little more stock is sold, work on construction will commence. Philadelphia parties subscribed $700,000 to the road.

POWER PLANTS.

Americus, Ga.—An electric plant, supplying day power for manufacturing enterprises, will in all probability be erected here, and the company controlling it proposes installing a street railway system as well. The latter enterprise alone will represent an investment of $150,000.

Fort Fairfield, Me.—The work of surveying for the large plant to be built at Aroostook Falls to develop the water power of the Aroostook River, has begun under the direction of the Maine & New Brunswick Power Company. The estimated horse power at the falls is 8,000, and the river has a drop of 72 feet in three-quarters of a mile. Electric power will be furnished for a greater part of Aroostook County and the western part of New Brunswick, including this place, Houlton, Presque Isle, Caribou and Limestone in Maine, and Andover and Perth in New Brunswick.

Winston-Salem, N. C.—The Winston-Salem Power Company is arranging to begin work on the new electric power plant to be located near the Salem Creek.

BIDS WANTED.

Charleston, Ark.—J. A. Corbell is in the market for machinery and equipment and estimated cost of construction of electric plant to furnish light to 600 residences, 100 stores and 20 arc lights, including generator, wire etc.; also cost of equipment for power plant to operate a motor car 20 miles.

La Grange, Ga.—Bids will be asked in about 30 days by the Electric Light Commission for the construction of an electric light and power plant. Roy Dallas is city engineer.

Marksville, La.—Sealed bids for the construction of a system of waterworks and an electric light plant for this city, will be received up to 4 P.M. August 24. C. Ashton Smith mayor.

Winnipeg, Man.—Sealed tenders addressed to Alderman J. C. Gibson, chairman of the fire, water and light committee, for a 500 kilowatt electrical generating plant will be received until 3:30 P.M. August 28.

NOTES FOR INVESTORS.

Latest quotations for copper are: Electrolytic, 15⅜@15½c.; Lake 15⅜@15½c.; casting, 14⅞@15⅛c.

July gross earnings of the Philadelphia Rapid Transit Company increased $80,000 over July of last year.

According to a director of the Chicago Telephone Company there will be no necessity of a new stock issue this year.

The Dallas (Tex.) Electric Corporation has authorized an increase of preferred stock from $1,500,000 to $2,000,000.

New York Interborough Rapid Transit stock on Monday advanced to 222¼, but before the day was over dropped back to 219.

The gross earnings of the Brooklyn Rapid Transit Company for July exceed, according to a reliable authority, $1,600,000.

The stockholders of the Philadelphia Rapid Transit Company will hold their annual meeting on September 20. Books close August 30 and reopen September 21.

A statement from headquarters says that the surplus of the General Electric Company is approximately fifteen million dollars, equal to 30 per cent. of outstanding stock.

The stockholders of the Allis-Chalmers Company will hold their annual meeting at 15 Exchange Place, Jersey City, on September 7. Books close August 17 and reopen September 8.

The foreign demand for copper continues very strong, with the exception that there has been a slight temporary let-up in the Chinese buying. Europe is taking a large amount of our copper.

The reorganization plans of the Eastern Ohio Traction Company are progressing rapidly. Before the end of the year it is believed that the receiver will have been discharged and a reorganization completed.

The Pennsylvania Railroad Company announces that it will extend the elevated railroad tracks in Pittsburg along Duquesne Way to East End and to Braddock and beyond and will use electricity as its motive power.

Judge Grosscup has entered an order allowing the receivers of the Chicago Union Traction Company to issue receivers' certificates, maturing February 1, 1906, to take up first mortgage bonds of the Chicago Passenger Railway Company.

A dispatch from Cleveland says that the National Carbon Company will soon have a competitor in the United States Carbon Company, which is to be organized with a capital of about one million dollars. It is said that Rockefeller interests are backing the new concern, although this is denied at Standard Oil headquarters.

A director of the Metropolitan Street Railway Company of New York says: "Earnings of the Metropolitan Street Railway Company are the largest this summer in the history of the company and prospects for the future were never so good as now. The Interborough has been a benefit to the Metropolitan by reducing long distance travel and increasing short haul travel."

Notice of the merger of fifteen electric light and gas companies in Luzerne County, Pa., with a capital of one million dollars, has been filed in the State Department at Harrisburg with the approval of Governor Pennypacker. The officers of the new concern are: C. H. Geist, Philadelphia, president; H. W. Noble, Detroit, vice-president; C. B. Kelsey, Grand Rapids, Mich., secretary and treasurer.

EDITORIAL NOTES.

The New Telephone.

The new telephone, or rather, the new telephone device, is about to make inroads upon the old order of things. The fact that its introduction has been rather slow does not militate against it. Its merit is obvious and for this reason a few of its most imminent applications are worthy of review. To be able to speak into a telephone and know that the message is received and recorded will inevitably lead to a species of satisfaction that will remove much of the annoyance felt, due to the absence of those with whom communication is desired. Their physical presence, in many instances, is not so great an advantage before or during the receipt of a message as after it has been received. A contemplation of some of the messages received, away from the influence of those sending them, may have the effect of altering opinions and decisions most markedly. In business life, where dispatch is believed to be imperative, errors are made more frequently if statistics count for anything, than anywhere else. The attachment of a device by means of which the record of all speech received is preserved, will undoubtedly throw a peculiar light upon the conversations of men, more with respect to their indefinitness than their explicitness.

The art of speaking into a machine in which there is no response calls for more than an ordinary effort on the part of the novice. The Poulsen invention cannot, therefore, meet with instantaneous success, but in certain respects a telephonic recorder would outshine the newspaper, if, by its use, the news of the day could be made to reach the feeble and the blind.

In Buda Pesth a telephone newspaper has been in use for several years with considerable success. It consists only of a receiver, not a transmitter. At certain stated intervals during the day, messages are received all over town by subscribers, and the local, national and international news disseminated widely and effectively. By means of the Poulsen attachment, a long ribbon of steel tape may preserve its record for years. The value of this, its compactness and ready advisability certainly marks the possibility of a new epoch in telephone development.

It is essentially a telephone instrument, not as some are led to believe, merely a phonograph of peculiar construction. It seems to possess all the qualifications that indicate practicability, and for this reason, its usefulness in the broad fields of commercial life and journalism will not be affected by the need of continued repairs, adjustments and annoying attentions. To the very busy classes of financial men, the knowledge that the telephone will hold all information, until their time permits them to review it, will mean not only an enormous extension of business possibilities but a relief from the actual physical strain of immediate response. In legal transactions such a device will assume the dignity of a document. It will rapidly put a stop to incoherence and indefiniteness over the "phone."

* * *

The Benefits of Railroad Competition.

Although our regard for some things is largely based upon their financial accessibility, there are notable instances where our ultimate appreciation is due to the effects of a persistent competition. In this respect it is interesting to view, from a broad and general standpoint, the benefits of railroad competition, how it has affected a marvelous change in our modes of travel, how it has annihilated distance, and finally how it has developed a new traction system, the advantages of which are going to be so widespread as to threaten to ingulf the value and prestige of the well-known steam road. It is so generally accepted as true that railroad competition is merely the cutting of rates; that the business methods employed are directed along purely commercial lines; that, in fact, a supervising business management of a high order, is all that is required to transform a franchise, tracks and rolling stock into an active center of railroad prosperity. This, we say, is the commonly accepted belief, and, in consequence, the true spirit of railroad competition has been lost sight of—the appreciation of improvements necessary to a wholesome success; the purchase of new machinery to replace the old; the equipment of the cars and their accessories; and the legitimate inquiry into the possibilities of other traction systems, like the electrical, for instance.

The benefits of railroad competition are only correctly regarded, therefore, as the benefits of railroad progress. In this respect, where can progress be better found than in the plans and specifications of the New York Central and the Pennsylvania Railroads? In a certain sense the necessity for modern progress arises through the desire to continue in existence. In other words, progress and preservation are almost synonymous in railroad work. As far as this idea has crystallized, it is in its best form in electric railroad work. It is approaching a stage of development and trustworthiness that promises great things. It is the index of American enterprise and investment. Who can say whether its influence will end with anything less than a trunk line across the continent?

* * *

Our Wire Manufacturers. One of the interesting features of the electrical supply trade, is its steadily increasing volume. The variety of supplies and devices now obtainable present a unique case in the development of this particular field of industrial work. The element of inventiveness displayed betrays itself in a constant and ever increasing effort to improve upon the old order of things. Not only are devices in particular developed to a high point of perfection, but the general character of those representing parts of a system also receive proportionate attention. Specific cases could be referred to illustrating this fact. One, however, is well worthy of attention because of its full qualification as a sample of the results of systematic improvement. The manufacture of wire, for instance, exhibits a series of ramifications that cover an immense territory in a metaphorical sense. Plants which turn out a No. 40 silk-covered wire are differently equipped from those manufacturing a transatlantic cable. Yet between these two extremes lie an immense variety of other kinds, required in electric lighting, bell and annunciator work, electric telephone installations, electric power, street railway and conduit work, and railway signal and fire alarm or messenger equipments. The manufacturers of general lines of machinery, such as motors and generators, consume enormous quantities of wire and the demands they make are so different in the way of insulation and cost, from those of the installer of electric light cable, that it is readily realized how large and diversified a knowledge is necessary to meet these different contingencies. The builder of coils and telegraph relays belongs again to quite a different category. Where special forms of insulation are required to overcome difficulties in daily practice, ordinary skill will not suffice and a scientific study of these new limitations becomes an immediate necessity. The maker of rubber-covered insulated wire has the contractor and jobber on his back They in their turn, have the underwriters and any other fire insurance inspectors demanded by law, overseeing and testing the quality of their goods, so that it is seen that the mere process of covering copper wire with insulation is not sufficient to meet municipal conditions at least. The wire manufacturer is thus the exponent of high quality. In fact, it is practically impossible to dispose of poorly made material, in the present stage of the profession of electrical engineering, under any circumstances, but to retain high qualities throughout this varied assortment of grades and kinds of wire is not an easy task. It is only through costly experimenting that so successful an issue has resulted.

◆

A new pattern army field telephone is to be experimented with this month in England. It is somewhat similar to that in use in the Japanese Army. The apparatus, strapped to the shoulder of an infantryman, contains a reel of 200 yards of one telephone wire, and a receiver and transmitter. It is claimed that telephonic communication can be kept up for several miles by a handfull of men, and instructions accurately conveyed to commanders in the firing line from the directing staff, the use of gallopers being thus almost dispensed with.

UNDER THE SEARCHLIGHT.

Notes and Comments on Various Topics.

Experiments in electric smelting, which are to be conducted at Sault Ste Marie, Canada, will be completed in about two months. M. Herault of La Praz, Fance, inventor of the Herault system of smelting by electricity, is now on his way to America and will go to Canada to give the Government the benefit of his advice.

◆

Municipal ownership at Spirit Lake, Ia., has proven a failure and the water works system and electric lighting plant are to be turned over to a private party.

◆

According to a report received Friday at the Navy Department, Washington, D. C., ships of the North Atlantic fleet have communicated with one another by wireless telegraph at a distance of about 262 miles.

◆

One of the most violent electric storms experienced in years burst upon New York City and the surrounding country last Sunday afternoon and wrought great damage. One person was struck by lightning and killed and a score of others seriously hurt. Buildings were set afire, telephone and telegraph wires were wrecked and trolley car service in some sections was at a standstill.

◆

The fire alarm system in Boulder, Col., had not been working satisfactorily and the batteries at the fire station were thoroughly overhauled, but to no avail. A systematic search was then made when it was discovered that red ants had carried sand up into one of the boxes, getting access to the inside by means of the keyhole. They had taken in enough sand to ground the entire system.

◆

According to an English contemporary a new apparatus has recently been brought out by means of which electric heat may be applied to the inner ear. One end of an "otoscope" is inserted in the external ear, the other end remaining open for viewing the interior surface, and the heat from an electric coil in this is blown through into the ear by a hand-bulb, or otherwise.

SETTING TYPE BY TELEGRAPH.

BY A. FREDERICK COLLINS.

During the past few years several successful printing telegraph systems have been placed on the market, and among the most noteworthy of these may be mentioned the Baudot, Rowland, Buckingham and the Murray. Machines of the latter type are now being subjected to tests by the British Postoffice. A prolonged trial of their merits is going on in the German Telegraph Service and a number of the instruments have been ordered by the Russian Government.

As originally designed the Murray Telegraph Printing System was not intended for sending messages between distant points, but for operating linotype machines automatically; that is to say, a perforated tape which had been produced by a typewriter keyboard was utilized to actuate the mechanism of the typesetting machine. In developing his ideas with this particular purpose in view, Mr. Murray ascertained that his invention was equally applicable for telegraphic transmisssion, and, further, that operating a linotype at a distance was as easy of accomplishment.

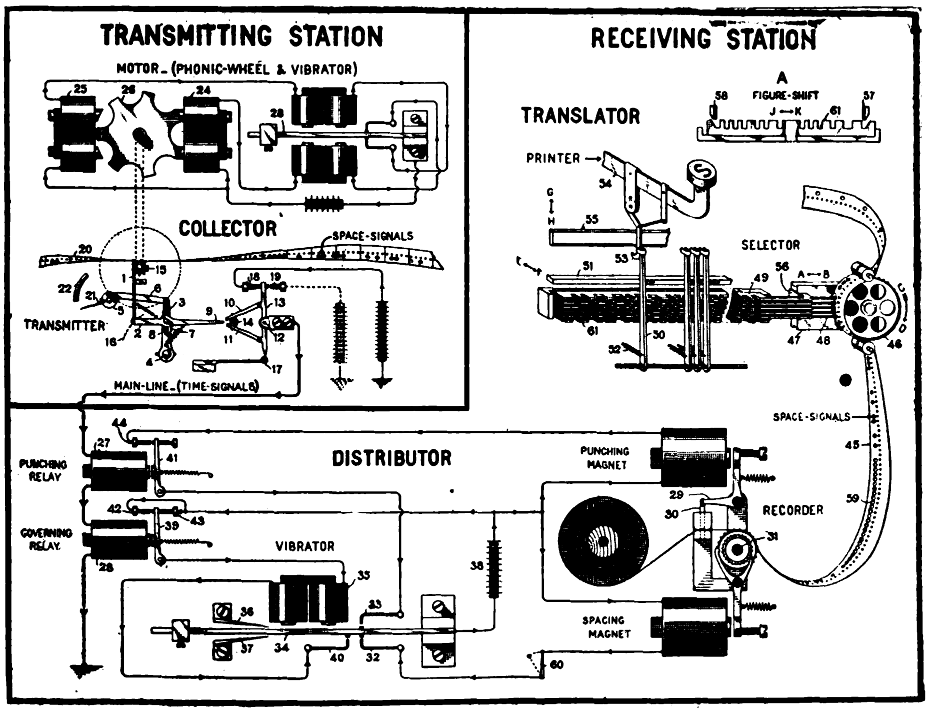

Fig. 1.—General Diagram of Murray Automatic Printing Telegraph System.

In the Murray automatic system the transmitter comprises a collector, a motor and a vibrator, while the receiver includes a distributor, recorder and translator. The arrangements employed at opposite ends are clearly set forth in the diagram, Fig 1. The first step in sendinga message is to prepare a tape by means of a perforator, a device having a keyboard like a typewriter, but instead of printing Roman letters it translates these into a telegraphic code and punches them in a tape of paper. Figs. 2 and 3 show photographically the keyboard perforator. It is operated on 110 or 220 volts direct current, and to avoid sparking at the punching contacts a condenser is shunted around them. The case serves to support a feed wheel for the tape of the ordinary Wheatstone type.

The perforator is formed of a punch block and five punches, and these are operated by the armature of an electromagnet which punches on its first stroke and feeds the tape one letter space at a time, on its return stroke. The perforator is essentially electromagnetic in action yet there are only two electrical contacts—one for punching and the other used as a letter counter to indicate the length of the lines for page printing. The keyboard has 33 characters and the touch of the keys is very light and the play short, so that these factors interfere as little as possible with the highest speed the operator is capable of attaining. The translating mechanism is simple and the complete instrument is quite as portable as an ordinary typewriter.

The correction of errors on the tape, for which the Murray system is noted, is accomplished easily and quickly. In all other telegraph printing schemes it is necessary in order to change a single letter to rub out an entire line. In the Murray apparatus when a correction is to be made the operator rectifies his error by striking the key of the back-spacing lever, the letter shift key and then the letter required. This eliminates the great objection of operators to machine printing telegraphs where the danger of making a mistake distracts his attention and causes him to work much more slowly.

After a number of messages have been punched on the tape it is put into the automatic transmitter. In the Murray single-line transmitter the electric impulse is not broken up into a succession of dots, as in the Morse system, by the separate holes, but a continuous telegraphic signal is sent over the line which is equal in length to all the perforations representing a letter. Where those parts of the tape intervene that are not punched the current is reversed and is so maintained until fresh perforations appear.

In the construction of the collector a rod 1 is pivoted near its middle on a vertical lever 3 which turns on the pin 4; the lever 3 is given an oscillatory movement by a small eccentric wheel 5 acting through the rod 6 which is similar to that employed in a Wheatstone transmitter. The thrust lever 2 has a tooth 7 on its under side, which rests against a pin 8 in the vertical lever 3; the to-and-fro motions of the lever 3 causes the horizontal lever to oscillate also. The end of the thrust lever 9 approaches closely the ends of the converging thrust-bars 10 and 11, which are oppositely disposed and pivoted on either side of the pin 12 of the contact lever 13. The ends of the thrust-bars are made to impinge on a friction roller 14 by means of small wire springs, while the jockey roller 17 causes the lever 13 to make a good contact with the points 18 and 19.

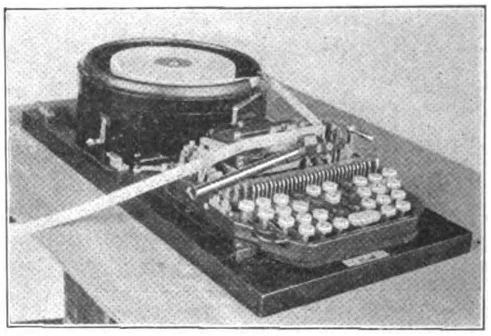

Fig. 2.—Keyboard Perforator with Cover Off.

When in action and the tape with its perforated message is fed through the transmitter in the usual way the small steel rod 1 reciprocates regularly against the paper tape 20, the dotted lines describing the arc 16 showing its course. For each unit of the tape the rod reciprocates once, the eccentric wheel 5 making two revolutions every time the star-wheel 15 revolves once, the shafts carrying the wheels having gears in the ratio of 10 to

1, as indicated by the dotted circle. Whenever the tip of the rod enters a hole punched in the tape the rod is free to complete its motion and this allows the thrust lever 2 to move as if it and the vertical lever 3 were of one piece, so that its movement compels its free end 9 to strike the projecting end of the lower thrust-bar 11, when contact is made by the lever 13 and pin 18. This action takes place every time the rod enters a hole in the tape though there is no movement of the contact lever, as it is already against the marking contact, being held there by the jockey roller 17 and the marking current continues to be sent out to the line; the instant that a portion of the tape that is not punched comes between the small rod and the plate above then the former cannot complete its reciprocation and the tape in this manner breaking the circuit of the marking current and the spacing current is sent to the line instead.

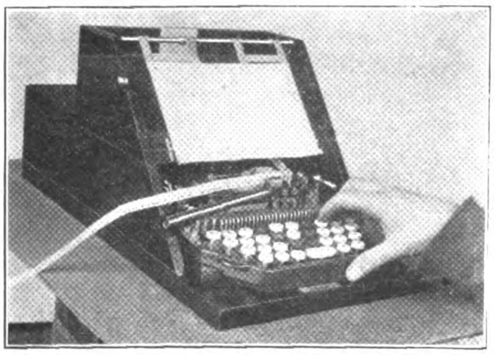

Fig. 3.—Keyboard Perforator.

To insure that the positive and negative current units or half waves shall be of equal length a small steel pointer 21 is attached to the eccentric wheel 5, which, as we have seen, makes one complete revolution for each half-wave positive or negative, the pointer indicating on a scale 22 when the bias as the difference between the negative and positive half waves is called, has been eliminated, for when there is no bias the needle will come to zero the instant the contacts of the positive and negative currents are broken; if, on the contrary, bias does exist the contacts can be adjusted until it disappears.

Fig. 4 is a photographic view of the single line transmitter. At the back of the rectangle frame is a La Cour phonic wheel motor that drives the transmitter, which is shown in detail in Fig. 1. A reference to this drawing shows that it consists of a vibrating reed 23, which sends electrical impulses alternately to the two-motor magnets 24 and 25, and these acting on the armature 26 keep it in constant rotation.

The impulses from the sending station are received by the distributor at the receiving end. Two relays, one for punching and the other for governing, a vibrating reed and a recorder comprises the apparatus of the distributor. Through the medium of these two local relays, 27 and 28, the electro-mechanism of the distributor is governed. The recording device is formed of a punching magnet and a spacing magnet; the punching lever 29 and the punch 30 is operated by the punching magnet. This punch of the recorder corresponds with the small rod of the collector, that is, the punch duplicates the motion of the rod and hence reproduces exactly the perforations in the tape.

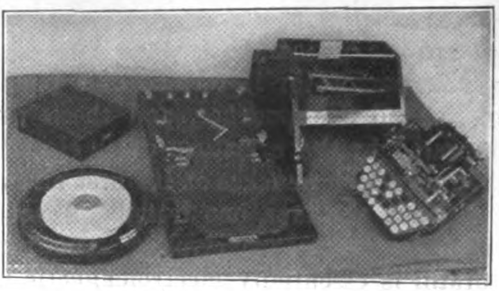

Fig. 4.—Keyboard Perforator Worked by One Magnet on any Electric Light Circuit.

The function of the spring magnet is to feed the tape, unit by unit, through the recorder, which it does by an escapement, the star wheel of which is driven by a motor on the spindle 31. That the alternating current action of these two magnets may be had the windings of the magnets are placed in separate circuits, which are made and broken by the contacts 32 and 33 through the vibrating reed 34, operated by the magnet 35, and as the reed vibrates short impulses are sent first to the one and then the other magnet.

Isochronism only is required between the sending and receiving stations, synchronism being essential between the different instruments of the receiver. Isochronism means the identical speed of two bodies at a distance from one another and synchronism means identical speed and phase of two bodies at a distance from each other. It is a physical impossibility, Mr. Murray has pointed out, to secure synchronism between a transmitter and a receiver in telegraph systems, as the current impulses always lag at the receiving end; for this reason there is really no such thing as synchronous systems of telegraphy and the nearest they ever get to it is an approximation of synchronism, and the more exact the conditions of synchronism are the more inefficient the system employing it. The Murray system utilizes isochronism alone between the distant instruments, and this is easily and perfectly secured.

To secure isochronism the reed 34 is made to vibrate by the magnet 35, the abruptiveness of the movements of the former being counteracted by the buffer springs 36 and 37. The circuit, which includes the reed magnet 35 and the battery 38, has two make and-break contacts, the first through the action of the tongue 39 and the second the reed contact 40. The relays for governing and punching are exactly alike and are operated from the same source of electromotive force, so that they are synchronized perfectly, the tongues 39 and 41 being exactly the same period.

The front and back stops, 42 and 43, of the governing relay are electrically united so that at the beginning and end of a main line signal, when the tongue of the governing relay changes from one contact to the other, the circuit in which the reed is placed is broken while the tongue is in transit. In this way, synchronism between the relay tongue 41 and the vibrating reed 34 is obtained, for they must not only vibrate at the same rate but in the same phase as well. Thus when the tongue 41 makes contact with the point 44 the reed at the same instant makes contact with the point 33, though the latter may be vibrating at the rate of 75 times per second and 150 words per minute is going through.

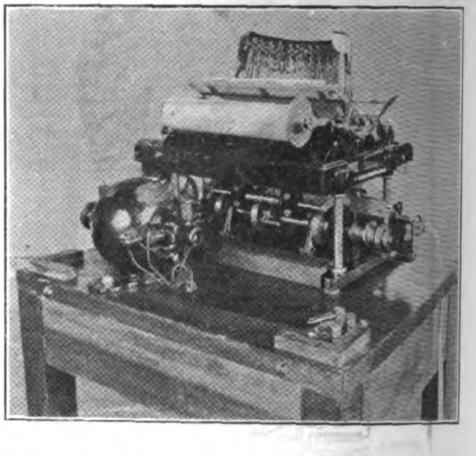

Fig. 5.—The Printer Complete, Including Typewriter.

The transmitted message having been punched on the receiving tape 45 by the devices described, the tape may be used for any one of a number of purposes, namely, for transmission over other circuits, or it may be run through a printer and the signals translated into printed letters on a page, or it may be used in conjunction with a linotype machine and the message set up and cast in type ready for press.

If the message is to be typewritten the tape is fed letter by letter by a star wheel 46 which is attached to a shuttle 47, the latter reciprocating between the points A and B, indicated by the double arrow. This movement is procured by the use of a cam, each reciprocation rotating the star wheel one letter space as shown by the arrow C–D. The shuttle carries a die plate coinciding with the circumference of the star wheel and having five holes in it, corresponding with the message holes in the tape. Five rods, 48, are fixed in the ends of the slotted combs or plates, 49, the rods being free to enter the five holes in the die plate if they are not obstructed by the paper tape which passes between the rods and the die plate.

When the shuttle with its die plate makes its inward stroke it presses the tape with its perforations, representing letters, firmly to the ends of the five rods. Where holes in the tape occur the rods pass through into the die plate and the positions of the corresponding combs are not altered, but where the tape is not perforated the corresponding combs are thrust back a sixteenth of an inch. This arrangement permits one particular group of slots in the combs and only one of the 56 combinations to be brought into alignment, so that a latch or cross-bar 50 can drop into it.

In the drawing only four latches are shown, but there are 56 of the small levers, one for each of the 56 permutations or groups of slots. A universal bar, 51, that just clears the teeth of the combs supports the latches or cross bars. At the proper instant the universal bar drops in the direction of the double arrow F E, leaving all the cross-bars resting on the combs, but only one out of the 56 is selected by the particular aligned group of holes in the tape. The combs form a system of 56 inverse permutation locks of which the cross-bars are the bolts or latches and the universal bar the master key.

One of the novel features of the Murray system is that it will automatically set type by telegraph, as already indicated. Thus, when a message arrives at the receiving station the holes punched in the tape will operate special keys on a typewriter, pulling the typewriter carriage back when necessary and working it as if by human hands. In the same manner a linotype machine is worked; a press message sent off in the usual way may, by means of the Murray apparatus, be set up in type at the other end and all over a single wire.

Nor is this the limit of its advantages, for it is possible to utilize the printing telegraph in connection with ocean cables, and what is more to the point, the prospect for its early achievement seems bright and hopeful. Experiments along this line are now in progress, the plan having been rendered feasible by combining the Murray apparatus with S. S. Brown's cable relay and perforator and using what is known as the Cooke alphabet.

ELECTRICITY LEAFLETS.

BY NEWTON HARRISON, E. E.

THE INCANDESCENT LAMP.

Introduction.—Much of the development of electric plants in the United States is directly attributable to the incandescent lamp. In the beginning nearly all the electric lighting was done by its means, and the extensive use of electricity was divided up between the arc and incandescent lamp, and very few motors. Arc lights were employed solely for outdoor illumination, and while representing a good quota of such electric lighting as was done in the early days, it belonged to quite a distinct and undeveloped field. The incandescent lamp, however, has passed through evolutionary processes of manufacture as well, and its origination, first appearance and final stage of manufacture will be recorded from scientific, commercial and economic standpoints.

First Experiments.—The heating of a wire in a glass bulb, from which some air had been removed, led to the further experiment of exhausting the bulb still more and noting the increased brilliancy and durability of the wire under these conditions. The glass bulb supplied with electrodes was used in physical laboratories for the purpose of demonstrating the peculiarities of a static charge in a vacuum. The need of an air pump of a better quality than those composed of a cylinder and piston led to the invention of the mercury vacuum pump. In this device a much higher vacuum than that ordinarily obtained was secured by letting mercury drop down a tube to which the bulb to be exhausted was attached. Globules of air were removed in this manner until, by continuing the process, the air in the bulb was reduced to what is now called so many millimeters or parts of a millimeter exhaustion, or a hundredth, thousandth or millionth of an atmosphere, as the case may be.

The improved method of getting a good vacuum stimulated inquiry in the inventive field with regard to the incandescent lamp. A high resistance wire was employed, the heating of which meant a certain amount of light. The light was brighter the more current was sent through the wire, until a point of volatilization was reached. This experiment, of raising platinum wire to a high point of incandescence, which gave rise to a brilliant light, though of a temporary and expensive nature, led to efforts to make the device more permanent as a light giver. Thomas Alva Edison's name in the United States and Swan's in England are connected with this stage of its history, and it is curious to note how their experiments, in many respects, parallel each other, although the Atlantic Ocean lay between the two laboratories and great secrecy attended the work of each.

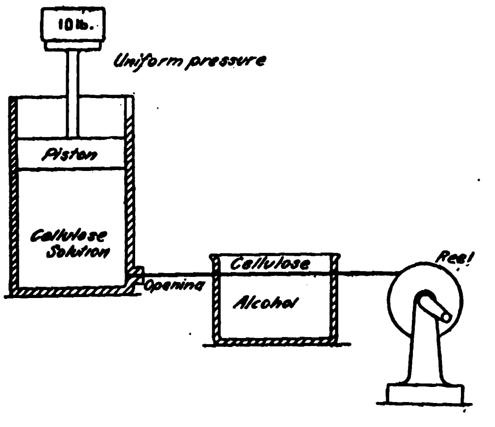
The platinum wire proposition was rejected after a while, also the hope of using metallic alloys of any description for a filament. The vacuum served to free the wire from the presence of oxygen and the effects of the radiation of the heat into the air which would otherwise be surrounding it. But though an indispensable precaution, the wire filament even under these advantageous conditions could not long resist the high temperature due to the current and its resistance. Edison followed the idea that a filament must be made with grain if composed of carbon. Swan believed the filament must be homeogenous if its properties were to give durability. Thus operating on different lines of investigation, one discovered in bamboo a good material, when carbonized, from which filaments from lamps could be made. The other treated threads with acid and with subsequent carbonization accomplished equally good results.

Why Carbon is Employed.—The use of carbon for a lamp filament was in itself a discovery of no mean importance. It was led up to as the result of conclusions arising from considerations of temperature and vacuum. The metals melt and volatilize readily beyond a certain degree of heat. Carbon, on the other hand, is very difficult to soften by heat, and its volatilization takes place in a very slow and limited manner. Carbon is thus specially adapted to fill a unique field in this respect, for the additional reason that the high temperature will not lead to its destruction unless carried beyond a certain high danger point, nor will it become consumed unless air is present. Holding the current in check and heating the carbon in a good vacuum thus expressed the correct working conditions.

Another reason why carbon is peculiarly suitable to this purpose is its high resistance. Although the question of its resistance is by far the most important, in respect to its current consumption, etc., the fact that its resistance rapidly *lowers* with each fresh access of current is one of the strongest arguments against it. But in other respects it is incomparably better than metals of any description, although of late certain rare metal oxides have been introduced successfully for incandescent lamp manufacture. Maxim used paper to make filaments from and Edward Weston employed a cellulose compound.

Whatever the direction of past or present experiments may be, the fact remains that a certain length of carbon filament is required to consume a certain amount of power. Under these conditions a certain amount of heat and light will be generated. One horse power of electrical energy produces enough heat and light, by passing through lamp filaments, to give from 160 to nearly 300 candle power. In other words, a long carbon filament could be inserted in a long glass tube, exhausted like a lamp bulb, and its length and light could be regarded as a fair standard of the results to be obtained from a detached series of lamps under ordinary conditions of practice. The filament is thus merely a heat machine transforming electrical into thermic and thermic into light energy.

Filament Manufacture from a Solution.—The original methods of making filaments have naturally undergone radical improvement. The bamboo strip is no longer employed, neither is the thread treated with acids, but a semi-liquid or viscous nitro-cellulose solution has taken the place of nearly all of the former filament bases. This is a product obtained by definite chemical processes, and is utilized for commercial purposes by forcing it through an aperture in a die or plate from which it issues as a fine thread-like length of translucent material. A vessel of alcohol receives this extending filament, affecting it sufficiently to harden it so that it may be reeled and laid away as stock for future use. The most evident of the chemical salts present in the filament, which must be absolutely removed by persistent washing is zinc chloride. A review of the process shows that one of the serious difficulties met with are air cells or bubbles of varying sizes. These are partially obviated by agitating or stirring the solution, but in spite of all precautions their presence is a constant menace to ultimate success.



Making lamp filaments from a solution.

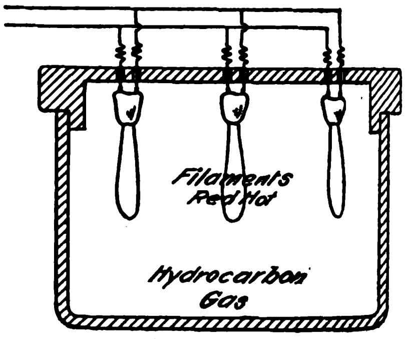
One of the remedies employed is heat in a vacuum retort, but this must be most judiciously regulated or the solution will suffer permanent injury. The filament thread, after being thus prepared, is of the general appearance and strength though of less diameter than a silk violin E string, or the material used for holding fish hooks to lines. The next step in the process is that of cutting up the material into certain lengths preparatory to the carbonizing process. The technical term squirting is given this method of manufacture, which has become in many respects the generally adopted plan. Various substances were originally tried for the purpose of making a pure and comparatively inexpensive cellulose useful for this purpose; they resulted in the ultimate choice of absorbent cotton, a specially picked and prepared as well as readily available foundation. For mere purposes of comparison it may be stated that the most expensive product in the world is a pound of carbon filaments complete. Hair springs for watches cost less in price per pound, though it is still the popular idea that in this respect they stand first.

Carbonizing the Filament—The care exercised in carrying out the process of carbonization belongs to one of the most delicate processes in connection with incandescent lamp manufacture. Powdered charcoal is used as a bed and covering for the horseshoe lengths, and direct contact with the air is carefully prevented during a long period.

The oven in which the future filaments are to be reduced, is gradually raised to such a temperature that they all become red hot. It is evident that the oxygen of the air would rapidly convert the entire mass into ash, if permitted to act directly upon it. The charcoal acts very effectively in holding any such tendencies in check. When removed the filaments are hard and elastic and appear like fine steel wires. It is supposed that the carbon of which they are composed is of very fine grain, perfectly homogeneous, and of an average resistance throughout. Tests have shown serious differences between filaments in this respect however, and individual filaments are not sufficiently uniform in structure to be ready for immediate use. The practice therefore of flashing represents one of the important preliminaries to the final comcompletion of the filament.

The Process of Flashing.—A microscopic examination of newly carbonized filaments showed great differences in diameter at various parts of the filament and the presence of open pores. The idea was suggested, therefore, of heating the filament to redness, while exposed to the influence of a gas containing carbon. The advantage of this lies in the fact that the carbon of the gas will be deposited wherever the filament is unduly heated, and otherwise it will form a uniform coating, thus removing the drawbacks noted.

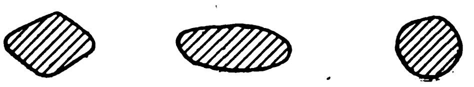
Glass receivers, holding a hydrocarbon gas, such as the vapor of naphtha for instance, are so mounted, that the filaments to be exposed to the flashing process, can be conveniently inserted and treated with the current. All uneven spots in the filaments thus undergo the effects of this method of establishing uniformity. The greater heat at the lesser diameters, means a heavier deposit of carbon there than at other points in the filament. The pores fill equally, and the filament when withdrawn, assumes a metallic luster and springiness which are regarded as its chief characteristics.



Flashing process.

Governing the Resistance of Filaments.—Although the flashing process builds up the filament, in the sense that it makes it uniform, the process in itself has the effect of reducing the resistance in total. In other words, discrimination must be exercised in exposing filaments to the current and gas; otherwise the resistances will be so varied that the impossibility of obtaining lamps of equal wattage and candle power will prevent their commercial exploitation. Thicker filaments than others can be kept longer in the gas, and during the flashing, tests of amperes and volts will indicate the exact value of the resistance. This cannot be done successfully when the filament is cold, because of its variation in resistance between the two degrees of temperature. The resistance of a 250 ohm filament will drop during the flashing process to 225 or even 212 ohms, and it may take place with comparative rapidity, unless the current supply is watched carefully. As the filaments before the flashing express great differences in resistance, it is evident that the commercial requirements make this particular phase of development the most important. Out of a thousand filaments, an equal number of adjustments may have to be made to approximate the standard of candle power. The more uniform the ultimate products of the lamp factory, other things being equal, the greater the advantages where efficiency tests for superiority are to be made.

Selecting the Cellulose Filaments.—When the original filaments are still on a reel they are slightly distorted from their first dimensions, particularly as regards their diameters, by the method of reeling or winding employed. The silk worm exudes a filament and then winds it about itself, thus constructing the cocoon. In this respect the making and winding up of the filament lengths is a similar process. But during that process the semi-hardened lengths change their cross-sections sufficiently to make marked differences when the sorting takes place. After the carbonizing process a sufficiently approximated selection is made to yield filaments so nearly alike in resistance, that the flashing process practically adds the finishing touch. The filaments, however, before the flashing, are measured cross-sectionally two ways, to see whether the width and thickness has provided cross sections that are equal, even though one filament may be a little flatter than another.



Possible appearance of the cross-section of the cellulose filament after winding. Cross sectional dimensions unequal.

Presence of Foreign Matter and Gases.—Volcanic actions seem to fairly represent the general character of the minute, but nevertheless similar class of phenomena, occurring in a filament undergoing flashing. Not only may these eruptions occur in this instance, but when the lamp is finished and in use, a peculiar yellowish black coating will collect within the bulb. All of this is the consequence of the presence of gas in the filament, held by pores developed during the carbonizing process. The original cellulose string is uniform in character, and devoid of perforations, cracks or pores. But the continued heating yields defects, which are partly removed in the carbon gas, although experience indicates their presence in the finished article. Foreign matter, infinitesmal in quantity according to some analysis and investigations, gives rise to equal minute explosions, the effect of which is to coat the interior of the lamp bulb with the film already noted. Oxygen gas is to some extent retained after the carbonization, but it is supposed to be entirely removed and absorbed during the flashing.

Joining Carbon and Wires.—The leading-in wires are of platinum, which pass through the glass into the bulb. Platinum was chosen because the coefficient of expansion as it is called of glass and platinum are about identical. If a metal was used for this purpose which expanded more rapidly than glass, it is quite evident that the glass would crack, air would filter in, and the lamp would be ruined. An equal expansion of glass and leading-in wires thus eliminates this danger, as presentd by the employment of platinum wire. Between these wires and the carbon filament ends junction must be effected by a cement or conducting material, which will withstand the requirements of practice. It was discovered that one of the simplest ways of accomplishing this is to flash the joint. The platinum and carbon terminals are held in juxtaposition and either a carbon gas or liquid is employed to supply the deposit. Its hardness, strength and durability, make this graphite joint one of the masterpieces of the art of lamp construction. Other ways of making a junction between these two elements, are carried out as in the original manner, consisting of the electroplating of one to the other, or clamping one around the other, or by means of a cement. Of these methods, the use of a carbonaceous paste, or the effecting of a junction by flashing, are most general in use.

EMERGENCY VALVES.

BY W. H. WAKEMAN.

ARTICLE III (Concluded).

Fig. 8 illustrates another emergency valve that engineers should understand, as, like those already explained, it possesses valuable features. It is shown in its normal position when in service with steam passing from 2 into 3, holding the valve 4 open; 5 is the lower part of a cylinder in which there is always at least some pressure to prevent violent closing of the valve. The hand wheel 6 is for lowering the stem 7, thus closing the valve directly by hand when required.

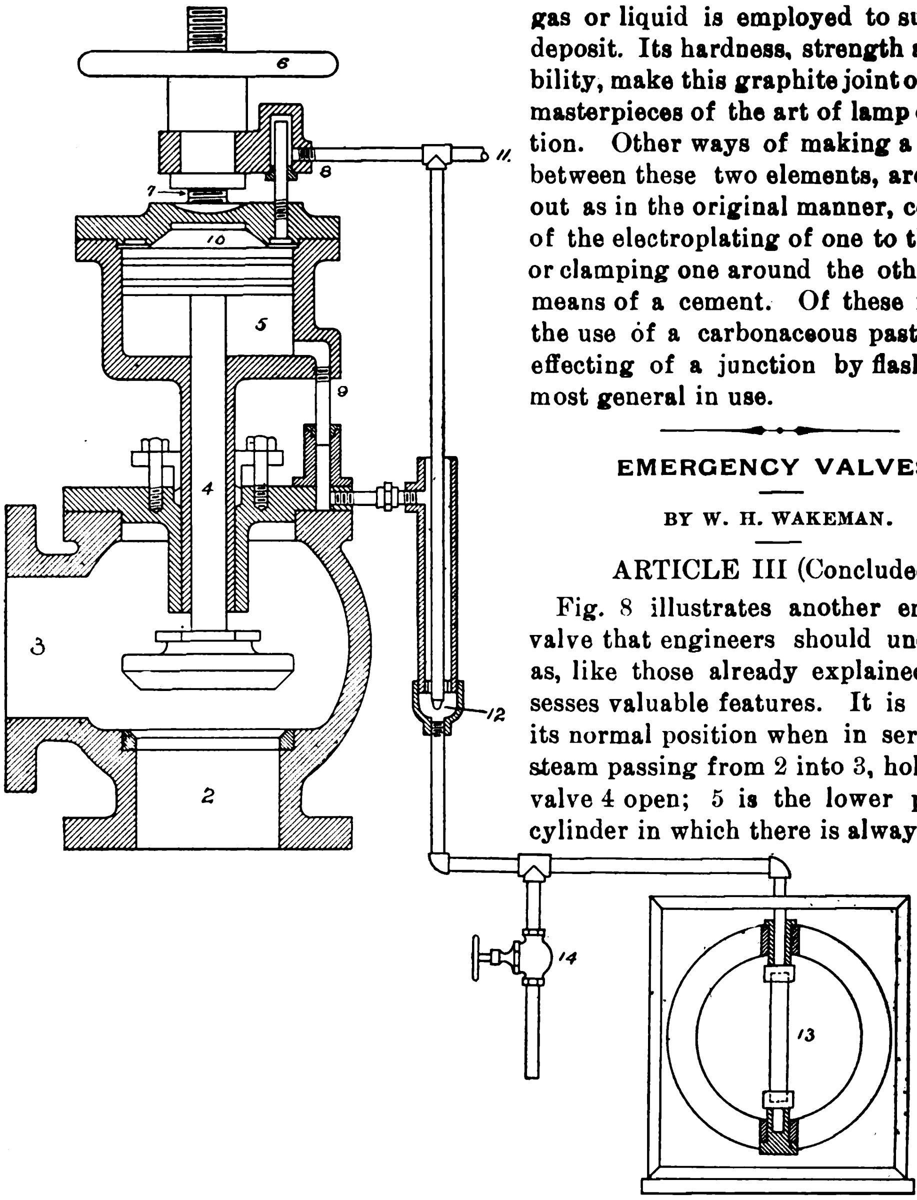

Fig. 8.

Steam is admitted at 8 and also at 9 to the lower part of cylinder 5 (as already mentioned), also to the upper part 10 from the boiler through the pipe 11. The outlet 12 is much smaller than the cross-section of pipe 11.

The steam pipe terminates in a suitable box located in a safe place, where it can be reached in case of accident to the main steam pipe. On the end of it is an ordinary water gauge glass, but the lower fitting is made solid to prevent steam from passing out at this point.

While in ordinary service pressure on both sides of the piston at 5 and 10 is equal, therefore it does not affect the valve 4, but when it is desired to close this valve at the shortest possible notice, the glass 13 is broken by striking it with anything at hand. Steam now rushes out here, but inasmuch as there is an unrestricted passage from 5 pressure below the piston is lowered.

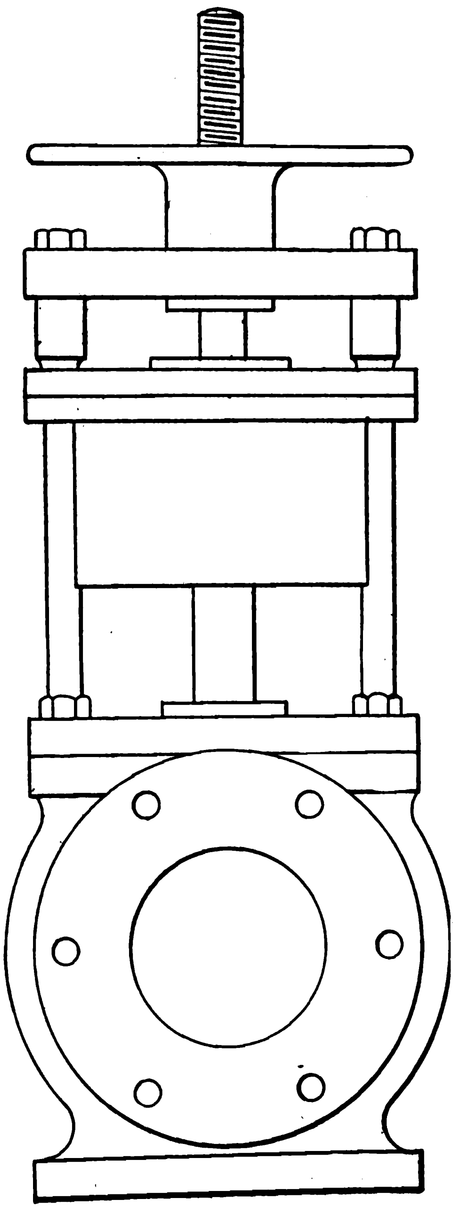

FIG. 9.

The small outlet at 12 prevents pressure from being lowered much in 10, consequently the piston below it is forced downward, closing the valve 4 quickly.

The object of this arrangement of piping is to maintain pressure in the cylinder at all times, so that it will always be ready for instant use. It will be noted that there are no valves to open or close, making a very simple device.

The valve 14 is for testing purposes. If it is opened pressure in the connecting pipes is lowered, causing the main valve 4 to close, if the apparatus is in good working order, and of course this is much more convenient than breaking the glass 13. This valve will not act automatically except to prevent steam from passing back into the boiler.

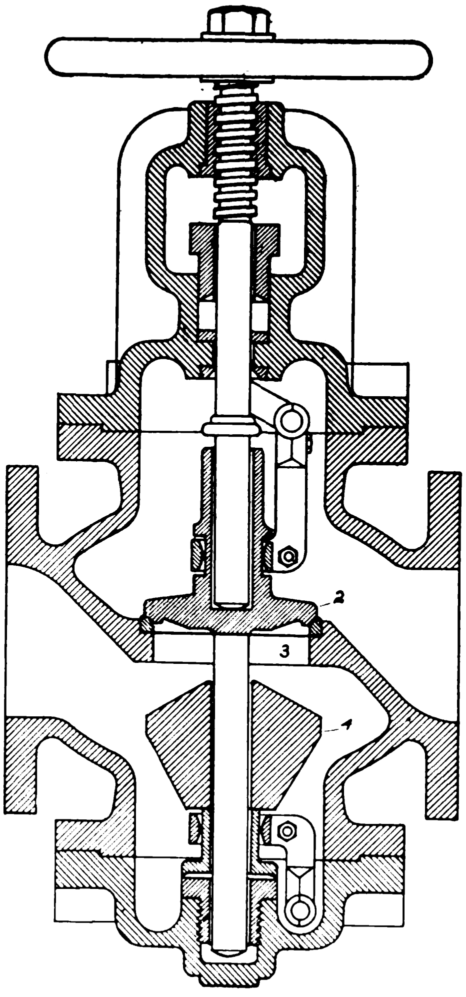

FIG. 10.

Fig. 9 is an exterior view of the same valve, taken at right angles to Fig. 8, showing the supports to the closing apparatus and giving a more complete illustration of the whole. Any of the foregoing angle valves can be secured in globe form if desired.

Fig 10 illustrates an emergency valve that works automatically in either direction and is entirely self-contained, requiring no outside appliances to operate it. The valve stem is screwed down as shown, thus closing the valve mechanically or by hand. When this stem is raised by means of the hand wheel the valve 2 is free to slide up and down. When steam is passing from left to right the valve 2 is open, but if anything causes the current of steam to be reversed, the valve instantly closes on its seat 3 and prevents steam from passing.

This seat is double faced as it is designed for use on both sides, for the large valve 4 is intended to operate against it at times. Suppose, for illustration, that an accident causes a very great rush of steam through this valve from left to right. This will cause the valve 4 to rise on its stem and shut off the supply at once.

Both of these valves are connected to links as shown, which terminate in levers outside of the valve case, thus providing means for testing them at any time, enabling the engineer to know that they are in working order.

This description of emergency valves shows the machinery that must be cared for in one department of the modern steam plant, calling for constant attention from the chief engineer, not necessarily because the apparatus is frequently out of order in common practice, but the ever-present tendency to corrode and fail to work when wanted must be met and overcome or else expensive machinery and appliances will not be worth their original cost in a few months. This does not refer to their selling price as that depends on surrounding conditions, but it does mean their present value when they are badly wanted in an emergency.

The days when muscular strength and bull-head tenacity made the most desirable chief engineer are no longer in evidence in our best plants, as cool calculation and intelligent use of reasoning faculties in connection with a steadfast desire to do all work thoroughly and well are now considered more valuable qualifications and are paid for accordingly.

WRINKLES.*

EDITED BY H. C. ABELL.

Removing Accumulations of Sand, Debris and Anchor Ice from Flumes and Racks.

We use city water-pressure of 70 pounds per square inch, but I think anything over 30 pounds would be effective. The method of application will vary in each individual case.

In our flume we have found that anchor ice will not go out of the sluiceways, but will gather in masses in front of our racks and on the surface of the water to a depth of a foot or more, and if allowed to remain would soon cause serious trouble. By the use of a fire hose, held at an angle with the surface of the water, we can drive the ice out of the sluiceways in a few minutes, while it would take an hour to do the same work by other means. It will be found equally effective in washing out wheel-pits, forebays and flumes when the water has been shut out for repairs, etc. We also make use of this means to deepen the channel of the river leading to our intake when the water is low in summer.

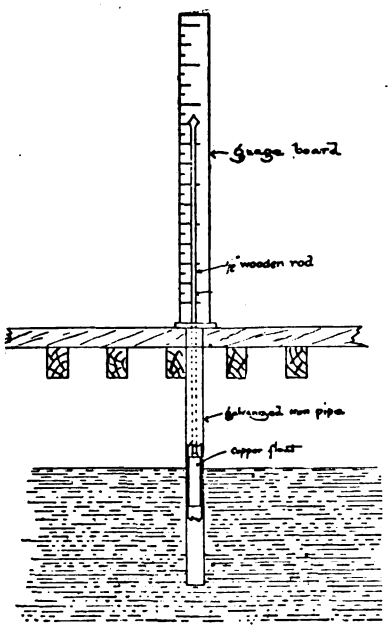
*Paper presented before the National Electric Light Association at its 28th convention, held at Denver-Colorado Springs, Col., June 6-11 1905.

J. C. FAGAN.

Head and Tail Race Water-Level Indicator.

The sketch shows a style of float we have in use to indicate the height of the water in our penstock; another float of identical construction shows the height of the tail water, and, of course, the difference between the two floats is the available head on our turbines.



WATER LEVEL INDICATOB.

The arrangement is very simple and inexpensive, and if the float is made large enough as to contain sufficient air, it is quite sensitive.

S. R. INCH, Missoula, Mont.

An Indicating Head-Water Gauge for Open Flumes.

It is at all times desirable to know the exact head under which a water-wheel is operating. A handy gauge for this purpose can be made as follows:

A float, consisting of light wood or other material is placed in the open flume, and a light rod or stick is fastened to it by nailing or screwing. The stick or rod must be of sufficient length to permit of a satisfactory guide being placed above high-water level to prevent the float from drifting down-stream. The guide may be made of a block of wood nailed to the flume and bored for the vertical rod, or a large screw-eye may be attached to the flume. At the end of the vertical stick or rod attach a wire, and run it over small pulleys to any convenient location for the scale. This should be a stranded wire, and ordinary picture cord will usually be found suitable. At the place selected for the scale the wire should be run over a small pulley, and should drop vertically, the end of the wire being attached to a weight heavy enough to keep the wire taut at all times, and counterbalance the weight of the rod and float to some extent. Attach to the wire a few feet above the weight, by means of a small clamp, or by double-pointed tacks, a scale divided into feet and inches. This scale should be of such a length that the extreme variation of head will come within its limit.

For the tail water an exactly similar float rod, guides, wire, pulleys, etc., should be used, and the wire dropped vertically, with a weight on the end and as near the scale as possible.

A pointer should be attached to the tail-water wire in such a position that it points to the center of the scale when the head is normal. Measure the head accurately with a tape line, or by other means and mark on the scale at the place indicated by the pointer; extend the scale as much as desired, and you will have a convenient gauge. Other scales may be placed near the wires at convenient points and adjusted so that you may know the inches or cubic feet of water flowing over the dam, or the loss of head due to rise of water in the tail race.

Loss of head in racks, gates or flumes can also be indicated in a similar manner.

Westport, Conn.

Maintaining Cooling Water in Transformers.

We have a set of transformers, cooled by coils of iron pipe, through which water circulates. The coils are fed from the mail turbine feed-pipes, and at certain seasons of the year the level of head-race is liable to drop several feet below the highest points of cooling coils.

To avoid the collection of air at these points, and consequent interruption of flow, the discharge from the cooling coils is connected to one of our exciter draft-tubes, thus securing uninterrupted flow during all conditions, with no perceptible effect on steadiness of exciter vacuum or speed.

G. HARTMAN,
St. Gabriel, P. Q.

ELECTRICITY IN SUBMARINE MINING.*

The almost indiscriminate use of mines in naval warfare, as practiced by the two belligerents in the Far East, has gone far to illustrate the practicability of modern methods of exploding them, and not the least significant fact brought to light is the unsuitability of electricity where it can be avoided. The chief reason for this is liability to deterioration in the Leclanche cell, which even on open circuit is apt to run down in consequence of leakage.

Those who are accustomed to associate the Leclanche cell with the common house system of bell circuits will hardly realize this liability to deterioration, but it must be borne in mind that the conditions under which the cell has to carry out its functions are very different.

In the ordinary house circuit the wires are under cover and protected from damp, and even when they are exposed to the weather, they have the advantage of evaporation for drying purposes. Thus it is that the insulation is so perfect that leakage is practically a negligible quantity. It is very different in submarine mining.

To begin with, the type of cell used in the navy is of very low resistance; in the ordinary "boat's battery" type, which we have in mind, it is about two-tenths of an ohm, and therefore capable of giving a comparatively large current.

The cells are either made up into large batteries of about 80 cells, for use in controlling the mines from a shore station, or are placed in the mine itself, a pair to a mine; in the latter case the mines are self-contained, and are known as "electro-mechanical" mines. The circuit has only one break, known as the circuit closer, and is otherwise completed through the detonators.

The circuit closer is a form of mercury contact which acts when the mine is bumped. Now, when a mine has been laid out for some time, the interior of it, even supposing there to be no leakage of water through the joints, gets very damp, the iron case sweats a good deal, there is a certain amount of leakage, therefore, across the terminals of the battery, and this is assisted by the slight creeping of salammoniac, which, in spite of precautions, almost invariably takes place to some extent.

This creeping may, perhaps, be in a large measure caused by the tidal and wave motion to which the mine is subjected, causing the liquid to wash about and leave deposits above its normal level; the Japanese have, it seems, rather successfully used dry cells in spite of their liability to deterioration, and here we may, perhaps, digress for a space, to give our experience of the deterioration of dry cells stored under naval conditions. These cells, when their internal resistance has gone above a certain standard, are broken up as old zinc, and it is almost invariably found that the cause may be traced to local action in the zinc eating it away and covering it with scale.

---

*From the "Electrical Review," London.

From whatever cause it may be, however, experience has shown that batteries used inside a mine deteriorate quickly, and are, therefore, unreliable after a certain length of time.

Batteries used outside a mine and on a circuit to be closed by a mechanical device inside it, run down through leaks in the submarine cable. The circuit here is invariably "earthed" through the steel armoring and so back through the sea water, and consequently the minutest leak soon develops.

It would appear, therefore, that electricity for automatic mines is doomed, and that its place will be taken by some purely mechanical device which will become released when the mine is struck, like the "horned" mines of the Russians; it is a pity that it should be so, for such mines, breaking adrift as many have done in the China Sea, become a lasting danger to shipping until they have been destroyed.

While speaking of mines and the application of electricity to them, it is curious to note that there have been proposals to fit them with zinc plugs, which, by galvanic action, eventually become eaten away and drown the explosive, sinking the mine, and thus putting it out of action.

South African Trade.

Advices from South Africa state there is no doubt that the scope for electrical enterprise is likely to expand in considerable proportions in the near future, so that American manufacturers should be on the alert for the expansion of their business throughout the sub-continent, now that a period of permanent activity has been inaugurated. At the present moment there is a growing demand for electric motors for lifts, the hydraulic lift appearing to have lost favor. In every new building electric elevators are being installed.

Like all other machinery in the Transvaal, electric motors are subject to Government supervision, and in order to establish uniformity in practice and to simplify the inspection work, a set of regulations for the construction and operation of elevators have just been drafted. These have not yet been put into force, but merely circulated in draft form for the information and comments of those professionally interested, prior to their legislation in generally acceptable form.

ENGLISH ELECTRICAL NOTES.

(From our London Correspondent.)

The Telephone Service in England.

The proposal of the British Government to take over the extensive telephone system of the National Telephone Company, which was referred to in these columns a few months ago, has been exhaustively examined by a special Parliamentary committee appointed for that purpose. The report of this committee has been issued to-day (August 1) and after carefully reviewing the agreement between the postoffice and the company effecting the purchase, the committee reports in favor of the acquisition by the State. The purchase, however, it is urged, must leave the position of municipal telephone systems unprejudiced, and municipal licenses may be granted between August, 1905, and December, 1911. Perhaps the leading point in the agreement which has called forth disapproval was the inadequate provision which was made for considerate treatment of the 14,227 employes of the National Telephone Company, when the system is taken over by the Government. In this regard it is satisfactory to mention that the committee recommend the Postmaster General to give an undertaking that no servant of the company, taken over by the Postoffice, shall suffer by the transfer in regard to pension. Such matters as the purchase price and the testing of plant in respect to its suitability for the requirements of the Postoffice telephone service, are to be submitted to arbitration if need be. But it is only on the understanding that nothing shall be done by the Government whereby the question of the future ownership and management of local telephone installations shall be prejudiced, that the committee recommends that the agreement shall come into force. If the Government finds time there is to be a discussion on the matter in Parliament within the next week or two, but in the event of that proving to be impossible, the agreement will take effect from August 31, 1905.

Liverpool Electric Railway Accident.

The disastrous collision which occurred at the Hall Road Station of the Liverpool-Southport Electric Railway on July 27, was not in any way an electrical accident. It was entirely due to the mistake of a signalman named Boote, who has made a full and complete confession of his error. When the reports of the disaster first began to spread all sorts of things were said about electricity, the design of modern electric high-speed rolling stock, the management of the railway, etc., by people who thought, as usual, they knew just where to put their finger on the spot where the chief weakness lay, but when the inquiry was opened the coroner took occasion to reprove the circulators of wild suggestions and impressed the jury with the fact that the disaster was in no way due either to the electrical equipment, the method of operation or to the management of the railway. The signalman, in error, allowed the express to pass at full speed on to a siding whereon a second electric train stood at rest, with the result that 20 persons were killed and a number injured. Londoners have lately become used to every slight mishap in a tube railway, or on the Metropolitan & District, being magnified in exciting and alarming terms in the "cheaper" newspaper press. These reports are calculated to give the public a want of confidence in electric railway traction, such as, it will be remembered, was evidenced on the electric tube railways after the Paris subway disaster. The Board of Trade is holding a full inquiry into the Liverpool collision and doubtless one of the purposes will be the proving that electric traction had nothing to do with the event.

London Electric Railways.

The work of electrifying the Metropolitan District Railway (London) is now practically completed. Electric trams are running between Ealing and Whitechapel, and from Harrow to Mill Park, and from Hounslow to South Acton. A service is also running between Kensington and Putney As cars are delivered further electric trains will be brought into running in substitution for the steam service. Both steam and electric trains are at present running over a portion of the Metropolitan system, and the cost of working has therefore been increased, but Sir Charles McLaren told shareholders the other day that this is quite unavoidable until the men get thoroughly used to the working of the electric trains.

Japanese Tariff.

The Japanese tariff of the present year provides that the dutiable value of imported articles shall be the actual cost of the articles at the place of purchase, production or fabrication, with the addition of packing charges, cost of transportation, insurance and all other charges incurred up to the arrival of the articles at the port of importation. In the event of an article under more than one rate of duty, it is to be assessed according to the highest of such rates. Special war taxes are imposed in some instances, and these became operative on July 1 of the present year, and are known to remain in force until one year after the close of the war.

Japan also levies varying rates of duty, having a general and a conventional duty; a consumption and a special consumption tax, and now the additional war tax.

The United States is classified with those having the "most favored nation" treaty, thus entitling her goods to entry at the conventional or lower rate of duty. It is also arranged that the war tax is not to be levied upon goods imported from those countries sharing the privilege of the most favored nation clause, *provided* they are accompanied with an authorized certificate of origin.

The following are the rates of duty of interest to the trade:

Electric light apparatus or instruments, and parts thereof, 10 per cent. ad valorem, war duty 5 per cent.

Telephones and parts thereof, 10 per cent., war duty 5 per cent.

Telegraph wire, galvanized, duty, 127 per cent. per 100 kins, of about 1⅓ lbs. each.

Telegraph wire, other than galvanized, 5 per cent. ad valorem.

Cars and carriages for street railways, 10 per cent. ad valorem.

Submarine telegraphic cables, and underground telegraphic lines or cables, duty 10 per cent.; war duty, 10 per cent.

New York Central's Sub-Station.

On behalf of the New York Central & Hudson River Railroad, C. A. Reed, architect, filed plans on August 8, for a two-story and basement brick electric sub-station, to occupy the south side of 50th street, extending over from the road's tracks at Park avenue to Lexington avenue. It will have a frontage of 361 feet in the street and a depth of 39 feet, and will cost $130,000.

This will be a most important sub-station, supplying electric power to the rails for the work of moving trains in and out of the terminal after the railroad's great improvements in New York are completed.

Some secrecy is maintained as to the exact plans of the road. It has bought a great deal of property along the east side of Park avenue, between 43d and 56th streets. This is the first definite information of the use it is to make of any of its property between Park and Lexington avenues.

Colorado Springs Searchlight.

A dispatch from Colorado Springs states that the electric lighting plant at the summit of Pike's Peak, has just been put in operation. The plant is operated by a 20 hp. gasoline engine. Work looking to the erection of a mammoth searchlight will at once begin, the rays from which when completed will, it is expected reach as far as the Kansas State line, a distance of 150 miles.

Morgan Construction Company's Catalogue.

The Morgan Construction Company, 40 Exchange Place, New York, is putting out a well prepared catalogue of its gas producers Much instructive information is given which heretofore has not been available to the public. An average efficiency of 92 per cent. obtained in tests made by Robt. W. Hunt & Co., give some idea of the progress that has been made in perfecting this producer. The catalogue contains fifty 6 x 9 pages with numerous illustrations. On the embossed cover is mounted a half tone of the producer printed in colors, showing the correct condition of the fire.

The Trumbull Switch.

The Trumbull Electric Manufacturing Company of Plainville, Conn., has just issued a supplement to its No. 5 Catalogue describing a Type A switch of a capacity of 1,200 amperes.

The greatest care has been exercised in selecting the material and in constructing this switch, and especial attention has been given to aligning the blades and jaws. After being perfectly adjusted, the blades are ground into the jaws with fine emery, to insure the smoothest contact surfaces. This adjusting is so accurate, and the contact so perfect, that these switches will continuously carry, without heating, a considerable overload.

ELECTRICAL PATENT RECORD.

LETTERS PATENT ISSUED AUGUST 8, 1905

Electric Railways and Appliances.

796,482. Trolley. William P. Wiemann, Allegheny, Pa., assignor to the Empire Machine Company, Pittsburg, Pa. Filed Sept. 7, 1904.

796,501. Conductor-Rail Holder for Electric Railways. George L. Courtenay, New York City. Filed Feb. 14, 1905.

796,509. Car-Fender. Elwood C. Hall, New York City, assignor of one-half to Albert C. Woodworth, same place. Filed Dec. 5, 1904.

796,697. Trolley-Catcher. Seth J. Buckland, Springfield, Mass. Filed Jan. 30, 1905.

796,817. Trolley Appliance. Frank P. Criner, Fort Wayne, Ind., assignor of one-third to Charles W. Stein, same place. Filed Dec. 19, 1904.

796,869 Trolley-Wheel. John C. A. Riecke, Baltimore, Md. Filed Jan. 14, 1905.

Electric Lights and Appliances.

796,467. Electric-Arc Lamp. Bernard A. Stowe, Cleveland, O., assignor to the Jandus Electric Company, same place. Filed Dec. 5, 1902.

796,629. Lamp-Guard. Thomas A. Edison, Llewellyn Park, N. J., assignor to the New Jersey Patent Company, Orange, N. J. Filed Aug. 1, 1903.

796,749. Electric Car-Lighting. James F. McElroy, Albany, N. Y., assignor to the Consolidated Car Heating Company, same place. Original application filed Feb. 20, 1899. Divided and application filed Sept. 9, 1901. Again divided and this application filed Oct. 6, 1902.

796,757. Electric Incandescent Lamp. William J. Phelps, Detroit, Mich., assignor to the Phelps Company, same place. Filed April 25, 1902. Renewed June 5, 1905.

Electrical Machinery and Apparatus.

796,474. Motor-Control System and Switch Therefor. Leonard A. Tirrill, Lynn, Mass., assignor to the General Electric Company. Filed April 15, 1903.

796,483. Feed-Regulating Device for Electric Motors. Seward W. Williams, Lapeer, Mich. Filed June 1, 1903.

796,491. Electrical Stop-Motion for Warping Machines. Richard C. Borchers, Philadelphia, Pa. Filed Dec. 12, 1904.

796,512. Extension Circuit-Closer. Jacob R. Hershey, Keokuk, Ia., assignor, by mesne assignments, to the Electrical Devices Company, same place. Filed Dec. 7, 1901.

796,555. Apparatus for Distributing Alternating Currents. Arthur F. Berry, Ealing, Eng. Filed Nov. 6, 1903.

796,606. Electromechanical Regulator. Joseph L Routin, Lyon, France. Filed July 17, 1901.

796,637. Combined Electric Motor, Rheostat, and Belt-Tightener. Herman S. Graber, St. Louis, Mo. Filed Dec. 8, 1904.

796,646. Time-Limit Circuit-Controller. Edward M. Hewlett, Schnectady, N. Y., assignor to the General Electric Company. Filed May 12, 1903.

796,675. Recording Instrument. Maurice C. Rypinski, New York City, and Lewis T. Robinson, Schenectady, N. Y., assignors to the General Electric Company. Filed March 30, 1903.

796,687. Circuit-Controller. Howard B. Wilson, Schenectady, N. Y., assignor to the General Electric Company. Filed April 18, 1903.

796,748. Power-Transmitting Mechanism. Wallace Marshall, Lafayette, Ind. Filed July 2, 1904.

Telephones and Telephone Apparatus

796,441. Telephone System. Kempster B. Miller, Chicago, Ill., assignor to the Kellogg Switchboard and Supply Company. Filed Feb. 4, 1901.

796,562. Telephone Call Mechanism. Tracy R. Campbell, Aberdeen, S. D. Filed Jan. 14, 1905.

796,568. Telephone System. William W. Dean, Chicago, Ill., assignor to the Kellogg Switchboard & Supply Company. Filed Oct. 27, 1902.

Miscellaneous.

796,435. Secondary Battery. Jacobus Langelaan, Oberschoneweide, near Berlin, Germany, assignor to the Pfluger Accumulatoren-Werke Actiengesellschaft, same place. Filed Feb. 27, 1905.

796,517. Battery-Holder for Automobiles. Frank Jackson, Denver, Col., assignor to the Jackson Manufacturing Company, same place,. Filed Sept. 27, 1904.

796,533. Electric Bath-Robe. Edwin B Rayner, Piqua, O., assignor to Clark B. Jamison and William J. Prince. Filed Oct. 2, 1902. Renewed Jan. 27, 1905.

796,550. Lightning Protector for Buildings. John P A. Anderson, Madrid, Iowa. Filed Sept. 20, 1904.

796,559. Electric Sign. Charles T. Bradshaw, Philadelphia, Pa., assignor to the Attracto Company, same place. Filed March 17, 1902. Renewed Jan. 18, 1905.

796,595. Telephonic Transmitter. Alexander Muirhead, Shortlands, Eng. Filed April 27, 1899.

796,596. Electric Telegraphy. Alexander Muirhead, Shortlands, Eng. Filed Oct. 14, 1901.

796,597. Telegraphic Receiver. Alexander Muirhead, Shortlands, Eng. Filed Dec. 13, 1901.

796,684. Electric Heater. Elihu Thomson, Swampscott, Mass., assignor to the General Electric Company. Filed Jan. 13, 1905

796,701. Electric Clock. Ragnar Carlstedt, Jersey City, N. J. Filed Sept. 1, 1904.

796,760. Lightning-Conductor. Frank E. Price, Chicago, and William H. McCullough, River Forest, Ill. Filed March 6, 1905.

796,800. Receiver for Use in Wireless Telegraphy. Edouard Branly, Paris, France, assignor to Victor Popp, same place. Filed Sept. 4, 1902.

796,851. Ruhmkorff Coil. John McIntyre, Jersey City, N. J. Filed Dec. 8, 1904.

796,872. Electroplating Device. Henry Schuessler, Peru, Ill., assignor of one-half to Emil Stroemer, same place. Filed Sept. 17, 1904.

796,977. Insulator-Pin. Fred M. Locke, Victor, N. Y. Filed Sept. 25, 1902.

THE TELEPHONE WORLD.

Independents add Another Link to Chain.

The Rochester, N. Y., telephone syndicate has secured the controlling interest in the Rome Home Telephone Company by purchases of Elyria, O., and Albany interests. For some time past the Rochester company has had an option which expired on August 1, and verification is now made through the Utica office of the Independent Telephone Securities Company that the option has been accepted and a transfer made. As in the past the management of the Rome Home Telephone Company will be under the direction of a local board of directors. The rumors that the Rochester company is buying up the interests of the Independent telephone companies for the Bell people are pronounced by Rome telephone people to be absolutely untrue. The Independents are working to establish a line across the State into New York City, and are said to be meeting with every encouragement.

Independent Telephone Meeting.

Representatives of all the Independent telephone companies in Illinois were gathered in Peoria last week for the purpose of forming a powerful organization, the object of which is to fight for business in that State.

It is proposed to connect all the Independent companies in the State by toll line, the ultimate object being to make a bid for interstate business. James D. Hoge, president of the National Association, delivered an address on "State Organization." Representatives were present from Michigan, Missouri and Iowa Four hundred delegates were in attendance.

A report from Concordia, Kan., states that the interest in the telephone question is at a remarkably high tide among the farmers. Their desires and undertakings now are, not only to join a few small lines and then ask for a franchise, but to thoroughly organize and incorporate a United Farmers' Company of Cloud and Republic Counties.

The Hattiesburg, Miss., city council has granted a franchise to J. A. and S. A. Jones and George D. Winter, of Chicago, to build an underground telephone system at a cost of $125,000. The franchise is to run for 25 years, and work to begin in 30 days.

The Clinton, N. Y., Home Telephone Company has moved into new quarters. A new switchboard has been installed which will accommodate 1,000 subscribers.

The Independent Telephone Company of Syracuse, N. Y., has ordered a switchboard costing nearly $200,000, and it will accommodate 12,000 telephones. Each telephone will be on a direct line.

The West Terre Haute, Ind., Telephone Company, capitalized at $10,000, has been formed with the following directors: Burton Cassaday, S. S. Gosnell and H. H. Knipe.

The automatic telephone system is being installed in Wilson, N. Y.

Independents Seek Telephone Franchise.

The applicants for the West Shore Telephone & Telegraph Company franchise were given their first hearing about two months ago before the judiciary committee of the common council of Milwaukee, Wis. There were present at the meeting Don Farnsworth, of Boston; Julius Simon and Attorney John W. Wegner, legal advisor of the company.

After a general statement of the parties seeking the franchise, the committee decided to go through the ordinance section by section, which was done immediately. Several changes were proposed by the aldermen to which the promotors readily consented. However, after the committee finished reading the ordinance it was decided to defer action until the second company, which applies under the name of the Milwaukee Home Telephone Company, has been heard on its application. This company is not in any way identified with the West Shore Company. Its backers are James B. S. Brailey, Jr., of Toledo, O., and Clifford Arrick, of Indianapolis, Ind. Mr. Brailey, is an experienced telephone contractor, having built several large Independent exchanges, among them the plant in Kansas City.

The Independent telephone companies operating throughout the State are also backers of the pending franchises as it is claimed by them that their cause will be helped materially if the Independent telephone movement gets a foothold in the metropolis of the State.

It is not expected that any report will soon be made to the council as both ordinances will be thoroughly considered before definite action is taken.

New Telephone Line for Michigan.

Walter Blodgett, of Detroit, has been in Benton Harbor lately, taking subscriptions for a new Independent telephone company that will be started in that city.

The new company will be known as the Standard Telephone Company, and will have lines and stations in St. Joseph, Grand Rapids and South Haven, in addition to the Benton Harbor exchange.

Mr. Blodgett says that he is meeting with encouragement in securing contracts from subscribers. The new company has retained the services of Attorney W. C. Hick. Since the consolidation of the Twin City Telephone Company with the Michigan line over a year ago, service in the two cities has been very poor and business men will welcome competition that will inaugurate a good service.

The Racket River Telephone Company has under way a complete remodeling of its system in Potsdam, N. Y., and when it is completed that town will have as fine a telephone service as modern machinery and methods can produce. An entirely new system will be constructed, and when it is ready for operation the old one will be removed. The work of erecting the poles will begin at once.

It is understood that Mrs. Brett, of El Paso, Tex., will make application for a franchise to conduct an Independent telephone system in Anniston, Ala.

Sale of Telephone Company.

The Commercial Telephone Company of Austin, Tex., has been sold at auction to a commitee representing the bondholders consisting of J. A. Quisinberry, of Danville, Ky., chairman; J. H. Gerke, of Wapakoneta, O., and Fred Bimel, of Portland, Ind. The franchise itself sold for $60,000, while the apparatus, fixtures, etc., and the company's lines in Texas brought $50,000, making a total of $110,000.

This sale was the result of a suit instituted by the bondholders to obtain the interest on $400,000 of the telephone company's bonds. The company, being unable to pay this interest, was put into the hands of a receiver, and Mr. George Shelley was appointed master in chancery with directions to foreclose the mortgage or deed of trust held by the bondholders and to sell the property to the highest bidder at an auction sale.

At the annual meeting of the New Brunswick Telephone Company, held in Fredericton, N.B., it was decided to erect a number of lines during the present season. They will include a line from Chatham to Dalhousie, connecting with Bathhurst, Campbellton and other places along the North Shore; also a line from Canterbury to McAdam, another from St. Stephen to Moore's Mills, and from Lepreau to Musquash, The company also decided to connect with the Kamaraska Telephone Company, by extending the line to Edmunston. A $6,000 brick building will be erected in Fredericton for the use of the company's head offices.

At a recent meeting of the board of directors of the Toledo, O., Home Telephone Company a voting trust was organized to remain in existence until 1910. The purpose of the trust, which will contain 70 per cent. of the stock, is to keep the local Independent plant from falling into outside hands or into the control of unfriendly interests. The trust is composed largely of the directors of the company.

Thus far 300 telephones in Columbus, O., have been placed in connection with the recently installed automatic switchboards. Officers of the company say it will require eight or nine weeks further to make the complete connections.

Postmaster, Willcox, of New York, has been touring Europe to study the postal systems in the larger cities, and says the London telephone service is much worse than it is in small towns in the United States. London has the finest mail service in the world, but New York leads in the use of pneumatic tubes.

The State Board of Valuation lately passed on the Citizens' Telephone Company of Covington, Ky., and fixed its total capitalization for franchise tax purposes at $200,000. The franchise value will be that amount less the tangible property already assessed by the city assessor.

The telephone business in Louisiana and North Carolina is under the control of the Railroad Commission.

The Independent telephone companies are giving excellent service in and around Lebanon, Ind.

GENERAL ELECTRICAL NEWS.

LIGHTING.

Boston, Mass.—An order has been issued by the gas and electric light commissioners in this city approving the issue of $5,000 of new capital stock by the Huntington Electric Light Company for the purpose of purchasing the electric lighting plant and business in Huntington formerly owned and operated by ex-Representative Henry E. Stanton.

Cincinnati, O.—The board of aldermen has adopted an ordinance introduced by Mayor Helmbold that provides for the submission to the voters at the coming election the question as to whether or not bonds, amounting to $50,000, shall be issued for the purpose of erecting a municipal electric light plant.

Citronelle, Ala.—The Business Men's Association, of which C. W. Thomas is secretary, will consider propositions for the establishment of an electric light plant.

Clinton, Ind.—The Clinton Electric Light & Power Company has been reorganized. The new officers are: D. McBeth, president; H. C. Dies, treasurer; J. W, Robb, secretary and manager.

Ft. Dodge, Ia.—The Illinois Central is contemplating the installation of an independent electric lighting plant in this city.

Greenfield, Ind.—The city council has decided to repair the electric light plant and at the last meeting ordered Superintendent E. C. Wolfe to proceed with the work.

Laramie, Wyo.—Superintendent W. A. Whitney, of the Union Pacific, who is in this city, said that there was more than a possibility of that company installing its own electric light plant here.

Lock Haven, Pa.—The Electric Light Company of this city contemplates enlarging its plant on East Church street.

Mt. Vernon, O.—Carl Hoster and Samuel Blumenthal, of the Hoster Brewing Company, have been here looking over the property owned by the Hoster Company. It is understood that the company intends to install a large electric plant.

Philadelphia, Miss.—The Philadelphia Compress Electric Light & Ice Company, has been incorporated with a capital of $30,000.

Princeton, Wis.—The proposition for this village to purchase an electric light plant was recently carried.

Urbana, O.—Architect William Miller, of Springfield, is preparing plans for the $5,000 electric lighting plant to be erected here.

Womelsdorf, Pa.—Plans have been prepared by William H. Dechant, engineer, of Reading, for the erection of an electric light plant for this borough.

STREET RAILWAYS.

Atlanta, Ga.—Charles J. Canfield, of Chicago, a millionaire electric railway man, and other Northern capitalists, together with several local parties, have been granted a charter by Secretary of State Phil Cook to construct a trolley line from this city to Macon, a distance of about 100 miles. The concern will be known as the Atlanta-Macon Interurban Railway Company and will have a capital of $100,000. The line will run through Fulton, Clayton, Henry, Spalding, Pike, Monroe and Bibb Counties. The construction of the new line will be begun within the next few weeks, the praliminary survey having already been made.

Belmont, O.—The Belmont Electric Street Railway Company has been incorporated with a capital of $300,000 by James F. Anderson and John DuBois.

Canal Dover, O.—A proposed electric line from this city to Lisbon or Salem is being agitated.

Chattanooga, Tenn.—The Chattanooga Electric Railway Company, it is stated positively, will construct a trolley line up Lookout Mountain in the near future. Conservative contractors state that the entire track from the bottom to the top of the mountain can be built for a sum not to exceed $25,000.

Dallas, Tex.—Plans are being quietly developed that will mature in the near future for the construction of an interurban electric road to extend between this city and Sherman.

Fremont, O.—Articles of incorporation have been prepared by Capt. D. H. James for a new railway company, which plans to have a through electric car service between Toledo and Columbus.

Kalamazoo, Mich.—Arrangements have been completed for an electric line from Battle Creek to Gull Lake and Grand Rapids.

Lawrence, Kan.—A meeting of the stockholders of the Kansas City, Olatha, Lawrence & Topeka Electric Interurban Railway was recently held here. All the business of the company was brought up-to-date, and arrangements were made for pushing the work of construction rapidly. Lawrence people at least are convinced that the road is a certainty and will be built the entire length that has been talked of. The directors of the company are: A. Monroe, Eben Baldwin, J. N. Roberts; A. F. Hunt, Jr., J. M. Belknap and F. O'Flaherty.

Marinette, Wis.—Menominee, Marinette and Crystal Falls capitalists are back of an electric railway which will connect this city and Escanaba.

Montgomery, W. Va.—A new electric railroad is projected in Fayette County, to run from Fayette Station to Fayetteville, the county seat, up the mountains upon which the town is located. It will be about 8 miles long.

Muscatine, Ia.—Local and Burlington capitalists have decided to build an interurban line between the two cities.

Opelika, Ala.—It has been officially announced that contracts have been let and preparations made for constructing an electric car line between this city and Auburn, for which 10 miles of track will have to be laid. The capacity of the Opeilka electric plant will be increased threefold to furnish power for the road and light and power for this city and Auburn. The company is capitalized for $300,000. Work of construction is to begin about September 1.

Paw Paw, Mich.—A movement is on foot looking to the speedy construction of a new line of railroad between this place and the village of Lawton. The Kalamazoo, South Haven & Chicago Traction Company, in connection with the Michigan Central, are back of the project.

Saratoga, Wyo.—Plans are now being formulated here for the construction of an electric railroad connecting this city with the Union Pacific at Walcott, and steps are being taken to form a company composed of prominent business men of this city and ranchmen and farmers in this vicinity and along the route of the proposed road. The line will be about 40 miles in length and capable of handling the freight as well as the passenger business.

Shelbyville, Ky.—The promoters of the Shelbyville & Ohio River electric line have announced that the bonds for building the road have been floated in the East, and that the road will be built. The survey makes the length of the route 50¼ miles. Milton, Ky., opposite Madison, Ind., is the starting point. Thence it will run to Carrollton, Campbellsburg, and from there to New Castle, thence to Eminence and this city.

South Bend, Ind.—Charles F. Knowlton, of Indianapolis, has met local business men with a view of interesting them in an electric railway line which is proposed from Ft. Wayns to this city.

Terre Haute, Ind.—P. Chase, of Decatur, Ill., C. W. Mills and H. C. Kohn, of Chicago, have asked the county commissioners for a franchise to erect a traction line over the new Wabash River bridge.

Vermilion, O.—It is generally believed that this city is soon to have a new electric railway.

Youngstown, O.—An effort is being made to have the Shenango Valley Traction Company build a branch to New Wilmington.

POWER PLANTS.

Hamilton, O.—B. S. Hughs, consulting engineer, of Wyoming, O., will superintend the construction of the 9,600 hp. plant for the Champion Coated Paper Company in this city.

North Wilkesboro, N. C.—The Gordon Manufacturing & Power Company of this city has been incorporated with a capital stock of $20,000 for the purpose of operating a plant for generating electricity for light and power, and operating electric railways. The incorporators are: J. Gordon Hackett, Richard N. Hackett and H. W. Gwyn.

Reading, Pa.—The Reading Illuminating Company is making active preparations to erect a power plant. The incorporators of the new company are Gustave Uldricht, Ralph W. Difford and others.

BIDS WANTED.

Omaha, Neb.—Sealed proposals for an electric lighting system will be received until 10 A. M. August 21, at the Fort Omaha Constructing Quartermaster's Office.

Washington, D. C.—Sealed proposals will be received at the Treasury Department Office of the Supervising Architect, James Knox Taylor, until 3 P. M. August 22, and then opened for the installation of an electric passenger and freight elevator in the West Outbuilding, Bureau of Engraving and Printing in this city, in accordance with drawings and specifications, copies of which may be obtained at the office at the discretion of the Supervising Architect.

NOTES FOR INVESTORS.

Latest quotations for copper are: Electrolytic, 15⅜@15½c.; Lake 15⅜@15½c.; casting, 14⅞@15⅛c.

Mayor Weaver of Philadelphia is advertising for bids for electric lighting next year.

The American Telegraph & Cable Company will pay the regular quarterly dividend of 1¼ per cent. on September 1.

People in close touch with the two big electric companies declare that the relations between General Electric and Westinghouse seem now to be harmonious.

Advices, largely authoritative, indicate the existence of a plan for a great subway and elevated system covering the whole city of Pittsburg and tapping Allegheny.

The stockholders of the Citizen's Telephone Company, of Grand Rapids, Mich., have voted to increase the capital stock from $2,000,000 to $3,000,000, to provide for additions and extensions.

H. H. Gerry, Jr., general manager of the Missouri River Power Company, of Helena, Mont., announces that the Light & Traction Company's property in that city has been sold to J. G. White & Co. of New York.

The Pittsburg & Butler Street Railway Company has awarded the contract for constructing its trolley line from Etna to Butler, Pa., to the Ferguson Contracting Company of Pittsburg. The amount involved is about $1,000,000.

The American Railways Company (Philadelphia) declared the regular quarterly dividend on the stock of 1½ per cent., payable September 15, to holders of record August 31. The annual meeting of the company will be held on Thursday, September 21.

The stockholders of the Hartford, Conn., Street Railway Company will meet on September 6 to act upon a proposition to sell its contract, property, rights, privileges and franchises to the Consolidated Railway Company and distribute the net proceeds among its stockholders.

The Metropolitan Street Railway Company of New York reports gross earnings for the month of July of $1,892,689, an increase of $79,400 over those of July last year. The earnings for last month were the largest for any July in the history of the company.

The Brooklyn Rapid Transit's gross earnings for the fiscal year are expected to approximate $17,500,000. A rumor to the effect that the company had or would declare a 2 per cent. dividend is absolutely denied by the controlling interests, who state that it is the policy of the company to steadily improve the road in all departments and to perfect the system.

President A. G. Wheeler, of the Chicago Subway Company, writes as follows about the future of the company: "There has been much adverse comment on Subway stock, but it does not affect the value of the security, which will not be purchasable, probably some time next year under 200, and in course of time not at all. Insiders are content to pick up all the stock that is offered."

The Consolidated Railways Company of Connecticut, which controls 525 miles of electric railway lines, showed net earnings for the year ended June 30, over and above all charges, of $426,000. The capital stock of the Consolidated Railways Company is $10,000,000, all but 15 shares of which is owned by the New York, New Haven & Hartford Railroad Company. At this ratio the investment yielded the New Haven a trifle better than 4½ per cent.

EDITORIAL NOTES.

Single Phase Street Railways.

Alternating currents first came into use experimentally, and for a considerable period belonged to the questionably applicable uses of electricity. The simple single phase current now threatens to gain much of its lost prestige, through its use in street railway work. A series motor is so constituted that a direct current will operate it in the same direction, whether it is reversed or not. An alternating current, in consequence, will not have any different effect upon it, from a direct current whose poles are being constantly reversed. The provision that must be made in such a case, however, is that the reactance within the machine will not be such as to interfere with the proper flow of current; otherwise the motor will be bulky and unwieldy, out of all proportion to its output.

Single phase motors of the series wound type are therefore the exponents of a new principle. They belong to a new series of possibilities in the electrical field. With the use of laminated frames, the correct proportioning of the turns on armature and field, and some care in the method of starting, it is quite easy to understand why this type of motor may usurp the so-called D. C. type in such cases as those requiring a long string of feeders to carry the proper potential to the various points of the trolley line. The single phase motor is not itself the only feature of value in this newly introduced system of electric propulsion, but the accessories of the system. The transformer takes the place of the feeder, in that its presence in the car lowers the higher tension of the trolley wire and tracks to the less dangerous pressure required. The economy in copper thus becomes an important feature; one that may lead to its greater adoption for comparatively feederless long distance trolley lines.

Saving in Machine Shops.

Machine shops in the United States are predisposed to improvements. They are the most progressive of all our institutions. They are places where a man's time is valuable enough to call for as much care in its utilization as circumstances will permit. Every hour of time saved by the intelligent manner in which work is done not only means profit to the shop but it means as well a reputation for dispatch. For this reason the machine shop has become the scene of the use of automatic appliances. It has become a true engineering center in which is focused the inventiveness, skill and labor of the best class of our constructors. And in addition, it has led to the investigation of certain important problems in shop economy which relate to the cost of turning out work, and in some respects, to the time as well. The features of this kind, to which attention is directed, are those of shaft and belt friction, and the cost of this manner of transmitting and distributing power, in comparison with the more up-to-date method of using individual motors for each machine. Tests of the efficiency in the first case gave rise to an interesting series of results, among the most important of which was a surprisingly high figure for the wasted power. This, as may be imagined, was only due to the friction developed by the stiff belts and countershafts employed in these shops, and it is not difficult to trace this waste again to the thickening of oil in the bearings and the change in the flexibility of the belting. In a shop using 1,000 hp., the countershafting consumes nearly 400 hp. From a dollar and cents standpoint, estimating the cost of a horse power at $50 a year, the extent of this loss can be measured up in the annual waste of $20,000. An installation of motors would naturally represent a greater expenditure in the first place, but the efficiency would readily average over 80 per cent. net and perhaps 90. From this standpoint, a saving of over $10,000 appears. A saving of this kind certainly warrants an investment of at least five times as much, or $50,000, in electrical transmission machinery. Machine shop saving in this respect, in large shops at least, means a profit in the operating expense. Modern machine shop practice is a scientific as well as a financial and mechanical proposition.

* * *

British Electrical Manufacturing.

The electrical engineering industry in England has not experienced that complete return to prosperity which was foretold by those who were of an optimistic turn of mind a year ago. According to our London correspondent, complaints are loud and continued regarding the undercutting and other effects of the severe competition which has existed in the electrical trade during the last few years. But for the heavy demands for money for the South African war, there might have been no difficulty either on the part of municipal authorities or private companies in securing financial support from public investors to help to maintain the previous excellent rate of development in electric lighting, power and traction directions, and to lead to still farther reaching developments.

If nothing had occurred to hinder the progress, there would have been plenty of work going for all electrical manufactories in Great Britain, not excluding the works established by American and Continental firms on English soil. This would have been the more assured by reason of the increased requirements of South Africa, Australia, India and other British colonies, which were becoming large customers for electrical material and machinery. But the South African upheaval, and the monetary tightness, not only stopped development in England, but to some extent closed certain foreign markets temporarily as well. It is taking a long time for these effects to pass off, and the recovery process, though its signs are becoming more evident, is not developing at such a rate as to permit electrical industrial companies to recover their lost ground and pay their way.

Two things are needed to effect the salvation of some of these concerns, and they are very closely related: the letting loose of money for industrial and engineering works, and the stopping of the ruinous undercutting of prices which has characterized every department of electrical work of late. Given the former, the latter would shortly follow because of the increased volume of business. Efforts have been made in some departments to bring firms dealing in certain lines together, effecting "understandings" for maintenance of prices which should show a profit. This has, we believe, happened in regard to motors, generators and engines, while the cable makers have an organization of their own. The profits on electric car building, too, have been so finely cut that during the last six months three big works in this line have amalgamated and ruinous competition has been stopped for the time being. Most of the leading electrical manufacturing firms have issued annual reports recently, and these show no improvement on the returns for the previous year. Some firms who managed to struggle on through troubles in earlier years have of late succumbed through the over-lateness of the electrical awakening.

UNDER THE SEARCHLIGHT.

Notes and Comments on Various Topics.

The telegraph operators are among the busiest people at the peace conference at Portsmouth, N. H. On the average 12,000 words a day have been cabled to Europe and Japan.

It is estimated that over 100,000 people witnessed Knabenshue's airship sail over New York City Sunday afternoon from Central Park South to 46th street and back. The aeronaut was up 1,000 feet in the air and traveled more than two miles, steering the airship with perfect ease.

Chief Engineer Wilgus has informed the New York Central directors that the change in motive power from steam to electricity for operating trains between 42d street and Woodlawn can be made within 12 months. Complete equipment of all steel non-inflammable cars, 50 feet in length, with electric fans for proper ventilation and an improved third-rail, have been fully arranged for. The improvement under way, including the new terminal at 42d street, with electric power plant, etc., will cost about $40,000,000.

Mr. Martin Brill of Philadelphia, who has been chosen president of the new street car merger, has demanded that the financial managers provide $2,000,000 more cash than the original plan called for. His demand will probably be granted.

A new scheme is said to have been successfully tried on a small scale in Madera County, Cal., for exterminating grasshoppers. A strong electric light is placed in a shallow trough containing a mixture of oil. The grasshoppers congregate and the oil kills them. Farmers who have employed this light method say that it promises to be most valuable, as only a few lights are needed, and these attract the grasshoppers in immense numbers from long distances.

The Philadelphia Electric Company was the only bidder for the electric lighting for that city for 1906. In every instance its bid was 3 cents per light per night less than the current rate, making a saving to the city of $118,000 per annum.

The Southern New England Telephone Company is planning to build roadside telephones on the more commonly traveled routes between New York and Boston for the use of automobilists. The telephones will be inclosed in boxes and automobilists will be given keys.

It is announced from Berlin, says the "Electrician," London, that more stringent regulations are to be imposed with regard to the admission of foreigners to German universities. It appears that the matriculation examination imposed on attending students is in most cases a pure formality. In the case of German students this certificate, obtained on leaving the "Gymnasium" or "Real Gymnasium," conferred the right to study at any technical university, and a certificate from any scholastic institution of equal rank with these, accompanied with a duly-attested passport, was considered sufficient in the case of foreign students. Now the following regulation has been issued and will come into force at the beginning of the next college term: "The conditions of admission for Germans apply also to foreigners, but in the case of the technical university at Dantzig special permission must be obtained from the Minister for Public Instruction before any foreign student, even though he fulfill all these conditions, is admitted."

Chicago's local transportation committee will take up the Mayor's 270-mile municipal railway plan next Monday and endeavor to agree on a system of transportation to be constructed and operated by the city in competition with the existing companies. It is estimated that the Mayor's system will cost $25,000,000.

THE MODERN PRINTING PRESS ELECTRICALLY DRIVEN.

BY FRANK C. PERKINS.

Where new printing establishments are being designed and constructed a direct-connected electrically-operated printing press is extensively employed as best meeting the requirements, but where existing plants are to be re-designed and arranged for electric driving, belt connections are very often found necessary between the motor and the driving pulley of the presses. A number of methods have been adopted for applying motors to printing machinery, the silent chain, gear and friction drive being utilized, as well as those mentioned above. The accompanying illustration, Fig. 1, shows an electrically-driven Babcock "Optimus" press, being operated by an electric motor with belt transmission and an idle pulley, while Fig. 2 shows a direct-connected Sprague motor driving a Cottrell four-color rotary press.

During recent years electricity has been introduced as a motive power in the printing press rooms of America, as well as Europe, to such an extent that these portions of the printing establishments are now models of neatness and cleanliness. The many countershafts and transmission belts have been entirely done away with, thus avoiding numerous dangers and difficulties arising from this method of transmitting power to the presses and other machinery utilized. There has been remarkable progress in the development of the electric motor and special controllers, systems of electrical control having been devised to successfully operate all classes of machinery used in the printing and allied trades.

It is now generally acknowledged that electrically operated printing presses are most economical in small as well as large plants, and many establishments have been able to reduce their operating expenses to a considerable extent as well as to greatly increase the output. The up-to-date printer realizes the importance of adopting modern methods to successfully cope with present keen competition, and therefore take the advantage of economical and labor-saving machinery wherever possible. Electric motors are specially suitable for driving this class of machinery on account of the ease of control, the efficiency and the cleanliness, as well as economy of space as compared with belting and shafting, resulting also in an increase of product at decreased cost.

Operating printing presses and other machinery of this class by the old method of countershafting and overhead belt has been discarded in many printing establishments on account of clean jobs being spoiled by the drippings of oil and accumulation of dirt on the overhead hangers and belts. The step-pulleys on the countershafts also limit the proper operating speeds of the various machines, owing to the extreme variation from one step to the other. It is also necessary where the old method is followed for the machines to be placed in arbitrary rows, in line with the overhead shafts; this involves a tremendous loss of power operating the many countershafts and idle pulleys, which varies from 40 to 60 per cent of the total power consumed, and also the possibility of a complete shut-down due to the breaking of a belt or lacing, upon which the motion of a number of machines is dependent. This explains a few of the most important and objectionable features of the old form of power transmission.

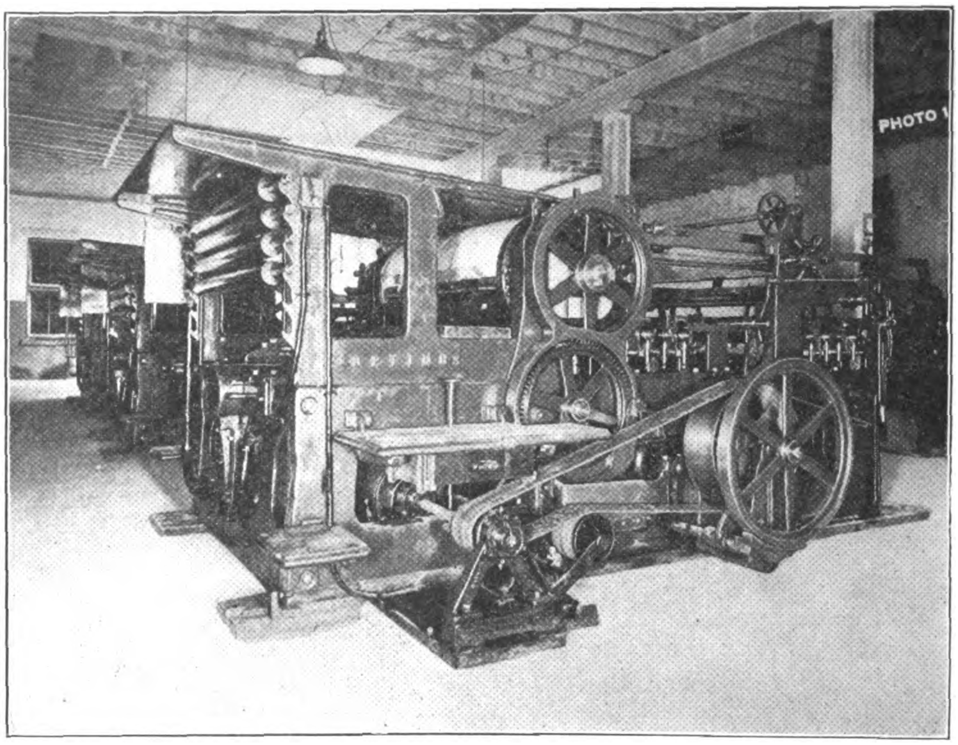

Fig. 1.—Electrically-Driven Babcock "Optimus" Press.

It is well known that electric motor-driven machines are clean because there are no overhead belts to throw dirt and oil. The motor and the machine it drives constitute an individual unit that may be placed in any desired position, because there are no lines of shafting and belts to be considered. As the power from the motor is transmitted directly to the machine without the use of intermediate shafting, the loss of energy in the shafting is saved. The operator has absolute control of the motor when in use, and is able to start, stop or regulate the speed instantly by the mere movement of a small lever or handle. Each machine and motor being a unit and independent of other machines prevents the necessity of shutting down an entire line of machines if one should fail, as frequently happens in establishments equipped with shafting. Moreover, it is unnecessary to supply power for the whole plant when only one unit is in service, as the moment the motor is stopped on the machine in use all expenses for current on that particular machine cease. This is an important feature, especially for machines, which are operated for short periods, such as make-ready, cleaning or changing form, etc., on the press.

In some cases belt transmission is found absolutely necessary, and the application of a motor to a machine by belted connection consists of either supporting the motor upon substantial brackets attached to the machine, or in a suitable locality, in such a position that the motor pulley will be in line with the pulley on the main driving shaft of the machine. A high grade belt, preferably "endless," is used for connection between the motor and machine pulleys. In applications of this character, where the distance between the motor and machine is limited, a short, wide, endless belt, with a separate idler is generally used, the function of the idler being to guide the belt in such a manner as to increase the arc of contact on the motor pulley, and also afford a means for adjusting the tension of the belt.

Some engineers claim that this form of drive possesses a desirable advantage as it affords a flexible connection between the motor and the machine, which protects the motor from serious overload, and should a strain become apparent, slippage will occur between the belt and motor pulley, preventing a disastrous overload being thrown on the motor.

The belt transmission equipment consists of a belted type motor, having an extended shaft upon which is secured the pulley. The motor is mounted on a substantial cast-iron base plate which also contains an out-board self-oiling bearing for supporting the extended shaft of the motor. A specially constructed top or bottom idler is also supported on this baseplate, the use of which enables the belt to be guided at any desired angle, thereby increasing the arc of contact of the leather belt on the motor pulley, and also permitting the tension of the belt to be adjusted as desired.

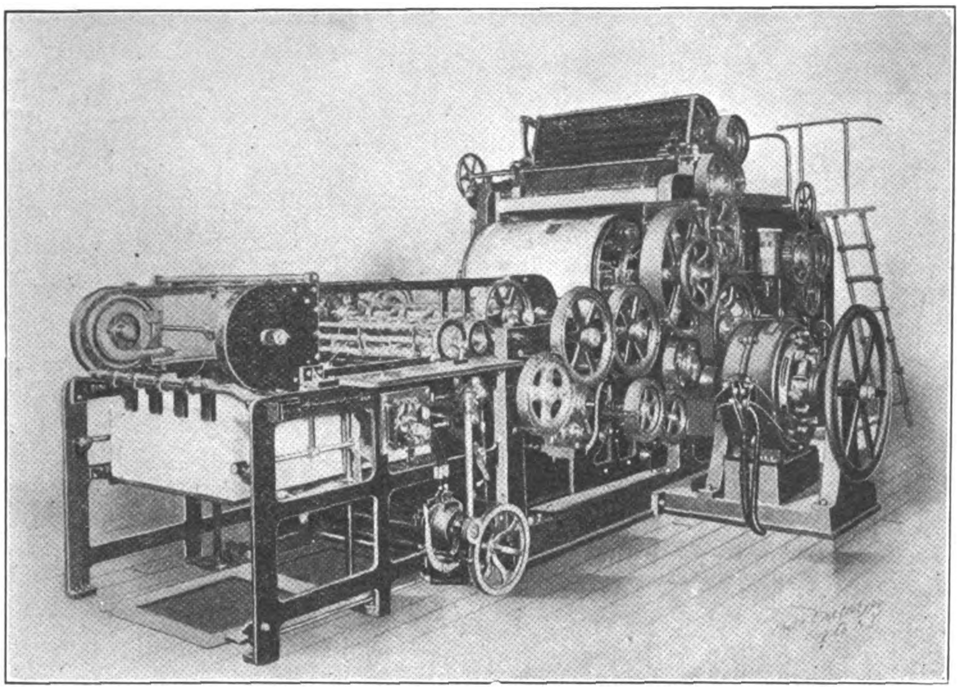

Fig. 2.—Direct-Connected Sprague Motor Driving a Cottrell Four-Color Rotary Press.

The chain drive is somewhat similar to that of the belted drive, except that instead of the usual pulleys and leather belt used for connection between the motor and the machine, a sprocket or gear wheel is applied to the main driving shaft of the machine, as well as to the motor shaft, and a special metallic endless chain is used for connection between the two sprockets. This form of drive is practically the same as a geared connection, except that its operation is noiseless, and it is possible to place the motor in close proximity to the main driving shaft of the machine owing to the short distance required between the motor and the machine shafts.

The gear drive, which is preferred by some, consists of placing a gear wheel on the main driving shaft of the machine and a pinion on the motor shaft. The motor is mounted upon rigid supporting brackets in a convenient position on the machine, so that the pinion on the motor will mesh into the gear wheel on the main driving shaft of the machine.

The gear wheels are constructed of either cast-iron or steel, and the pinions of the same material, or of raw-hide. When the raw-hide pinions are used the noise is materially reduced. A metallic casing or gear guard is used for entirely inclosing both gear and pinion, which not only reduces the noise, but also affords protection to the gear wheels. This form of drive affords a positive connection between the motor and the machine, and also enables the motor to be located in close proximity to the main driving shaft.

It is held by some engineers that direct-connected outfits usually require the use of abnormally slow-speed motors, as it is necessary to operate the motor at the same speed as the main driving shaft of the machine to which it is attached. With this form of drive the armature is connected direct to the main driving shaft of the machine. The field frame of the motor is rigidly attached to the machine by substantial iron supporting brackets. Owing to the low speed at which motors of this type are operated, the frame is necessarily larger than that employed for other forms of drive, so that while this method of application eliminates the use of any intermediate mechanism, and thereby gives a high efficiency, the first cost is greater and its use is therefore limited to applications where belts or gears would be objectionable. It may be stated that the general arrangement of the friction drive consists of a flexible mounting of a round type motor with a special friction pulley on the shaft. The motor is placed in a convenient position so that the friction pulley comes in contact with the periphery of the fly-wheel or pulley on the machine and the special mounting of the motor is such as to obtain the proper tension between the pulleys for transmitting the required power. The friction pulley is constructed of leather disks compressed on a metallic bushing between end shrouds, the periphery of which is leather. This form of drive is restricted to machines in size of about 2 hp. or less, and adapts itself to individual motor-driven machines, such as job presses, stitchers and cutters.

It may be noted that this equipment takes up a minimum amount of space, is absolutely noiseless in operation and affords a flexible connection between the motor and the machine.

◆

A TRACTION MOTOR FOR CONTINUOUS AND ALTERNATING CURRENT.

In a recent issue the "Elektrotechnische Zeitschrift" described a car supplied by the Allgemeine Elektricitats Gesellschaft for the Niederschoneweide Ostend (Copenick) tramways. This car is equipped with motors of the Winter-Eichberg type, which can be driven either by continuous or alternating current. For compact systems of town tramways continuous current working has been found best adapted, but where outlying branches or connecting links are concerned the advantages offered by alternating current becomes apparent, enabling, as it does, economies to be effected in the initial outlay and a reduction of the transformer losses. By working such branches or connecting links with alternating current it is possible to convey high tension current to the feeding points, and there transform it down by means of static transformers to the pressure required for the motors. These transformers need no attendance and have a considerably higher efficiency than converter stations, or it is possible to convey the high tension alternating current to transformers attached to the cars themselves.

On the tramway system in question continuous current was originally the only supply available, so that a transformer substation had to be provided. The line is usually worked with continuous current throughout its length, but to enable the experimental car to be driven also with alternating current, a small transformer station equipped with a motor-generator has been erected in a central position. The motor is supplied with current from the westerly portion of the overhead trolley wire and drives an alternator which furnishes single-phase alternating current through transformers to the easterly half of the trolley line. The two halves of this line are divided by a short section of dead conductor. By regulating the speed of the motor-generator the frequency of the alternating current can be varied between 25 and 40 periods at from 400 to 640 volts pressure. The pressure of the continuous current supply ranges from 500 to 550 volts. This experimental installation covers all the conditions which would obtain in the case of an interurban and urban tramways system, the small transformer station representing the town boundary, at which point the change from continuous current to alternating current working would take place in the ordinary way. In passing this point the driver has only to shift a lever on the controller from one position to another. Should he fail to effect the change at the right moment no damage would, however, result, the car in that case simply losing most of its driving force, and thus drawing attention to the omission. The car is equipped with two motors wound for a continuous current pressure of 250 to 275 volts so that with a line pressure of 550 volts they must be run in series. Hence, for continuous current working only series connection with resistance regulation at the controller is provided. The motors differ, however, from ordinary continuous current machines in that they have laminated fields to enable them to be worked with alternating current. They are six-pole machines of the Winter-Eichberg type. The collector has six brushes of which two are exciting and four short-circuiting brushes. The diagram of the winding is shown in Fig. 1, K being the short-circuiting and B the exciter brushes respectively. The coils S in the stator are the ordinary coils of the Winter-Eichberg motor, while the coils s constitute an auxiliary winding for the purpose of continuous current working. Since the armature is provided with series drum winding, the compensating coils, s, do not require to be distributed uniformly over the whole circumference. This enables the casing to be arranged in the ordinary way for traction motors. Naturally it would be possible to dispense with the coils s by disconnecting the short-circuiting brushes when running with continuous current. But as this would introduce a further complication into the controller, Herr Eichberg preferred to compensate the action of the short-circuit current in the armature by means of the coils s. For the rest it may be observed that the turns in these coils correspond in number to those in the armature winding but they carry a smaller volume of current, since less is taken when driving with continuous current than with alternating current. The effect of the coils s may be explained with the aid of the diagram (Fig. 2) which represents a two-pole arrangement. The only field which really passes through the armature is the active magnetic field, Φ, represented in the diagram by horizontal lines. Were the coil s not provided the armature would generate a vertical field which would induce a current between K K. As in Fig. 1, K K are the short-circuiting brushes and the exciter brushes are marked E E. S is the main winding in the stator and s the compensating coil required for continuous current working. When running with alternating current the compensating coils are cut out at the controller. With continuous current, on the other hand, the brushes, E E, are connected in series with the compensating winding, it being in this way insured that the compensating field is always exactly proportional to the armature current. Commutating poles are not used, despite which fact commutation with both continuous and alternating current is as sparkless when starting and running as with an ordinary continuous current traction motor. The speed of the car is from 15 km. to 20 km. per hour when the continuous current supply is used and from 25 km. to 35 km. per hour according to the periodicity, when the motors are receiving alternating current. This is in accordance with practical requirements, since a higher rate of speed is permissible out of town. Fig. 3 is a diagram of the connections in the car. Each circuit is provided with an automatic cut-out. It is, however, intended in future cars of the type to employ only one such device to serve both for the continuous and alternating currents respectively. The controllers resemble those of standard series-parallel type. Combined with each is a two-way switch, W G, which serves to change over from one system to the other as required. The windings s are also cut in or out through this switch. The armatures remain in series at all positions of the controller, while the stators may be connected in series or parallel through the main lever. A mechanical attachment actuated through the lever of the switch W G, insures that the stators are in series when continuous current is being supplied to the motors.—"Electrical Engineer," London.

ELECTRICITY LEAFLETS.

BY NEWTON HARRISON, E. E.

THE INCANDESCENT LAMP.

A Standard Pressure.—The adoption of a lamp of about 110 to 117 volts pressure, and an amperage corresponding to a fixed power consumption, was due to the production of a light source about equal to the ordinary gas burner of that period. The 16 cp. lamp thus materialized with a certain resistance, amperage, voltage and life. On this score, the life of a lamp offers an interesting study in skill, in manufacture, the limitations of materials and the scientific application which led to its improvement.

Lamp life is to some extent dependent upon the pressure. A changing or variable pressure will mean an over-illumination for one period of time and a decreased amount of light on other occasions. A uniform lighting pressure is therefore one of the first means to be adopted to secure a reasonably long life to a lamp. Other reasons why the lamp deteriorates and breaks are old age, vibration, a poor vacuum or a natural though early fracture of the filament.

Watts per Candle Power.—Different makes of lamps present different commercial propositions with respect to their life and economical operation as light givers. As already stated, a lamp is a device in which electrical energy is transformed into heat and then again into light energy. Although the outlines of this idea are simple and apparent, it is difficult to construct a device in which it is economically carried out. What is regarded as economy to-day is an economy of the lowest order, for the very reason that the twofold process of turning electricity into heat and from heat into light involves an ineradicable loss. Between the first and second step the efficiency is so high that nothing can be said in criticism. Between the second and third step the loss is so great that it reduces the effectiveness of the method to a low figure in an engineering sense. Calling the electrical energy sent into the lamp 100 and the heat energy given out by the lamp 97, then the light energy given out will only equal about 3 in comparison. In other words, if the step from the heat to the light could be better bridged than by such methods as are now in vogue, 16 cp. would become about 30 times as powerful at a maximum, or any less number of times as great, according to the efficiency. A 16 cp. lamp takes about 3.5 watts per candle power or something like 56 watts in all. If the conversion of power was complete from the electricity to the light without the second step the entire consumption could not exceed 2 watts.

Candle Power per Horse Power.—Experiments, conducted by Professors Barker, Brackett, Young and Rowland and published in the "American Journal of Science" about March 27, 1880, show a rating of calorimeter and photometer test per horse power as follows: 4.8, 8.9, 5.8 and 9.2 sixteen candle power lamps of four different makes per indicated horse power. An allowance of 30 per cent. was made for heating of wires, generator losses and engine friction. In the report handed in, the following statement appears: "The increased efficiency with rise of temperature is clearly shown and there is no reason, provided the carbon filaments can be made to stand, why the number of candles per horse power might not be greatly increased." As a means of indicating the drop in resistance, the figures obtained from a lamp are presented when in use as follows:

Resistance in ohms.	Condition of filament.
123	Cold.
94	Orange light.
83.7	$\frac{9}{10}$ candle power.
79.8	5 " "
75	18 " "

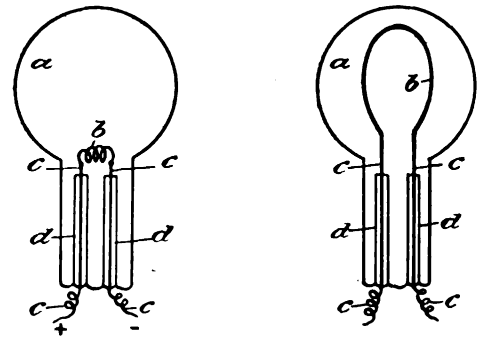
Figures based upon purchasable lamps at present can be compared with this table on the basis of the number of watt-consumed per candle power, though the resistances of each stage of light development are not given:

Watts per candle power.	16 cp. lamps per horse power.
1.0	46
1.5	31
2.0	23
2.5	18
3.0	15
3.5	13

The correct conclusion to be drawn from this array of facts, is not that power is being deliberately wasted in producing light, but that if more than the customary amount is produced it is so done at the risk of the life of the filament. In other words, the filament must be supplied with a perfectly uniform pressure to last, even under ordinary conditions, through its proper period. If the filament is forced, as indicated by the decrease in watts per candle power in the table, the increase in light is obtained by a nearer approach to the critical danger point, the point at which the carbon will fracture with greater ease, due to the abnormal temperature at which it is run. No guarantees of life are given by manufacturers unless the conditions stipulated at purchase are observed.

Higher candle powers per unit of energy cannot be economically obtained by means of carbon, but the substitution for this of a rare oxide filament, such as one made of thorium, etc., means the successful and long-continued operation of a 1.5 watt per candle power lamp, even with variations in line pressure.

Making the Lamp.—Sir William Crookes invented a radiometer consisting of a glass bulb with leading-in wires, an account of which was published in the Philosophical Transactions of the Royal Society of London about the time that lamp making only existed as an experiment. In this piece of physical apparatus leading-in wires of platinum were employed and a vacuum used to develop the maximum effect with the illuminating element. The incandescent lamp differs only from this in the use of a carbon horseshoe or high resistance arch joining the platinum terminals, as shown in the illustration.



CROOKES' RADIOMETER.

MODERN INCANDESCENT LAMP.

In both figures, *a* is the exhausted glass chamber, *b* is the illuminant or incandescing conductor, *c c* are the leading-in wires of platinum, to which the ends of the illuminant are attached, and which are hermetically sealed by fusion into glass tubes *d d*. The main conducting wires are attached at + and —.

The exact words of the patent granted to Edison on January 27, 1880, read as follows: "An electric lamp for giving light by incandescence, consisting of a filament of carbon of high resistances made as described and secured to metallic wires as set forth.

"The combination of carbon filaments with a receiver made entirely of glass, and conductors passing through the glass, and from which receiver the air is exhausted for the purpose set forth."

The lamps invented by Edward Weston, Hiram Maxim and Moses G. Farmer were types of great advancement. They ultimately became the property of the concern then called the United States Electric Lighting Company. The introduction of the hydro-carbon method by Maxim was one of the most important inventions in lamp construction and is to-day an indispensable element of success.

Siemens & Halske of Germany made an exhaustive series of tests for the purpose of determining the relative merits of the treated and untreated carbon filaments with respect to the hydro-carbon process. Their results are tabulated as follows:

Lamps with Untreated Carbons.

Burning hours.	EMF. in volts.	Current in amperes.	C. P.	C.P. per HP.	Watts per C.P.
0	100	.687	24.25	259	2.8
100	"	.666	15.7	173	4.2
200	"	.666	15.3	169	5.0
300	"	·664	15.2	167	4.4
400	"	·653	14 7	165	4 5
500	"	.640	13.7	157	4·7
600	"	.634	13.3	154	4 8
700	"	.630	13.1	153	4.9
800	"	.620	12.5	148	5.0

The results with treated carbons are doubly interesting when the column indicating the watts per candle are examined, particularly in connection with the number of hours of burning:

Lamps with Treated Carbons.

Burning hours.	EMF. in olts.	Current in amperes.	C. P.	C.P. per HP.	Watts per CP.
0	100	.552	25.0	333	2·2
100	"	.550	22.5	300	2·4
200	"	.550	22.0	290	2·5
300	"	.548	21.0	282	2·6
400	"	·547	20.0	270	2·7
500	"	.545	18·6	251	2·9
600	"	.545	17·1	231	3·2
700	"	.540	16.0	218	3·4
800	"	.532	15.3	210	3·4

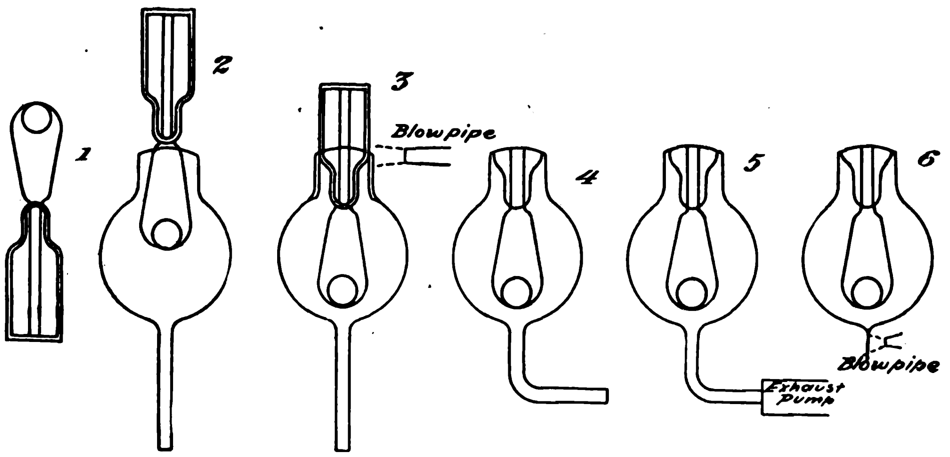
Summing up the results, the following data is of interest with respect to these figures:

	Untreated carbons.	Treated carbons.
Decrease in efficiency (per cent.).........	36.9	57.10
Decrease in illumination (per cent.)....	38.8	51.50
Average illumination cp. per lamp.......	19.67	14.91
Average output in cp. per hp.........	264.1	167.70
Increase in resistance in per cent........	3.8	10.80

The increase of over 30 per cent. in light due to the hydro-carbon treatment establishes the immense value of this process in the commercial manufacture and use of lamps.

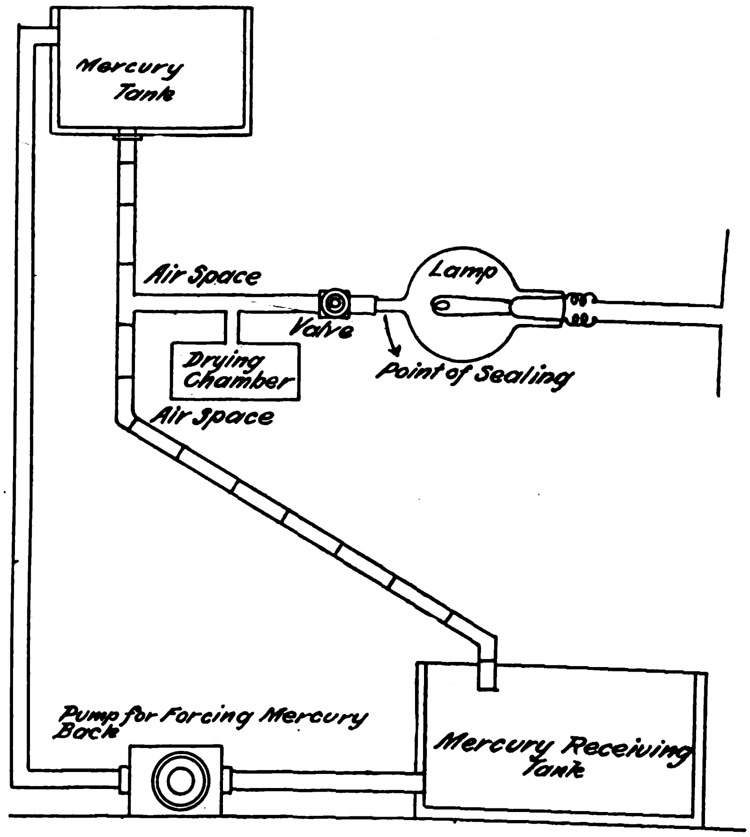
The manufacture of the lamp bulb, with its stem and tube for exhaustion, is shown in its successive stages in the figures 1, 2, 3, 4, 5 and 6.

The blowing of the bulb and the attachment of the stem with its platinum terminals and carbon filament constitute one-half of the process. The rest of the operation consists of the elimination of the air and the final sealing up of the tip of the lamp. A metal base is finally attached and the leading-in wires soldered to it. Plaster of paris is used to give firmness to the combination and solidity to the base. In the United States, the screw base is almost entirely employed and lamp sockets are made correspondingly.



Process of Lamp Manufacture.

The Vacuum Process.—Pumps for the purpose of creating a good vacuum have reached a comparatively high stage of development. They are constructed on the general principle of the Torrecellian method of producing exhaustion by means of mercury in a glass tube. If a tube sealed at one end and about 40 inches in length, is filled with mercury, and then its open end is carefully inserted in a deep vessel containing the metal, the mercury will fall away from the upper sealed end to some extent. In this empty space is found what was originally called a Torrecellian vacuum, a vacuum of a very high degree of exhaustion with respect to the atmosphere as it is.



Method of Exhausting Lamp by Mercury Pump.

The pumps employed are of a type in which a falling column of mercury produces a vacuum in the lamp by dropping down a tube to which the lamp is attached. The junction is effected on the side between lamp and exhaust pump. Globules or spaces form between the various sections of the mercury column. A systematic process of rarefaction goes on until the exhaustion reaches a safe point. This is about one one-millionth of an atmosphere, that is to say, one one-millionth of the pressure of the air, which is generally recorded as being about 15 pounds to the square inch. A sketch of this pump with regard to the principle it involves is shown in the illustration.

During the process of exhaustion the lamp has a weak current sent through it only sufficient to heat the carbon and the surrounding air. As the rarefaction increases the current is increased, until at the end of the process the lamp burns with full candle power.

Value of a Vacuum.—The absence of air around the filament means less immediate radiation from the incandescent mass to the outside air. The value of this is found in the lower current value required to heat the filament to incandesence. The lower the current value the higher the efficiency, other things being equal. By means of a vacuum a degree of commercial economy is obtained which lifts the incandescent lamp, light for light, to a much higher plane than gas. The relative efficiencies may be noted in the following general manner as about 10 per cent. for the arc, 3 per cent. for the incandescent and 1 or 1.5 per cent. for gas. Using a neutral gas in the bulb would mean a subtraction of heat from the filament to the outside air. This is not an efficient method, and for that reason has been practically discontinued. The advantage of heating the filament to get rid of foreign gases occluded by it during exhaustion is obvious. After the process is complete, the glass tip, connecting it by an orifice to the exhaust tube is melted and sealed permanently. In actual practice a long string of lamps are treated in this manner, the exhaustion and final sealing forming part of a rapid process.

Absorbtion of Moisture.—The prevalence of moisture is one of the bugbears in the way of obtaining a complete vacuum. In order to make this difficulty as negligible a feature as possible, the moisture is largely removed by means of a small drying tank attached to the pump. This little vessel contains a vapor-absorbing mixture, such as sulphuric or phosphoric acid, called the drying solution. A little phosphorus may also be introduced into a tube connected to the lamp for the purpose of combining with the last traces of oxygen present. In the Geissler air pump the mercury, instead of being pumped above after use is automatically lifted. The advantage of this is the same as using some pressure method without the risk of getting air into the mercury. The lifting of it permits it to operate as in the first place, to produce a vacuum by the Torrecellian principle. Lamps using no vacuum have come into the lighting field, but in this case the material giving incandescence is of an inoxidizable substance. Such lamps require certain preliminaries to be gone through before they will give illumination.

ECONOMY IN BOILER PLANT.

Although builders of boilers are presumably the persons most interested in building an efficient steam-raising plant, it must be remembered that they are hampered by conditions of competition arising from an improper understanding of the process of combustion and heat transmission on the part of prospective purchasers. The paper recently read before the Institution of Electrical Engineers in England by Messrs. Booth and Kershaw pointed out that, for the proper combustion of bituminous coal, a large combustion chamber and the use of refractory surfaces is necessary. This, however, means increased cost of boiler setting, and the temptation is very strong to tender for and build a boiler which will generate its guaranteed steam per pound of coal, when, say, anthracite is used, independently of the consideration as to whether Welsh coal can be economically brought to the locality of the boiler. In asking for tenders for boilers, therefore, the class of fuel to be used should be specified and a water evaporation guarantee on this basis asked for.

Where such precautions are previously omitted, losses in the steam-raising plant are certain to ensue. Air will probably be admitted in excess above the grate to avoid smoke nuisance, bringing down the temperature of the furnace gases. Increasing the amount of air admitted increases the energy consumed in producing draught and the amount of heat carried off to the stack. An artifice to prevent the premature cooling of the gases by contact with water-cooled plates and tubes is the introduction into the furnace of refractory brick baffles. Where the combustion chamber is not sufficiently large to contain these refractory surfaces, they are often interspersed among the tubes and flues. As, however, the gases have already become partially cooled, such devices can only be regarded as makeshifts to cover an initially bad design, and have, moreover, the effect of reducing the effective draught. Where it is found absolutely necessary for the avoidance of smoke nuisance to admit air above the grate, such air should be previously heated as much as possible to reduce the cooling of the combustion chamber as far as practicable.

In some boilers steam is admitted below the fire-grate. This device is useful where fuel giving intense local heat, such as anthracite or coke is used, as the rapid deterioration of the furnace bars is avoided by the cooling action of the steam, and this steam, in passing through the bed of incandescent fuel, unites with the carbon to produce water-gas It is, however, a fallacy to suppose that the admission of steam above the grate aids combustion. The space above the fires should be exclusively reserved for the proper intermixing and ignition of air, oxygen, carbon or carbon monoxide, and the energy absorbed in the dissociation of water will result in a net loss of heat.

To obtain the greatest amount of steam per pound of coal from the boiler, the maximum difference of temperature between the water and flue gases must be obtained at every point along the passage of the gases through the boiler. For this reason the hottest water should be found at the point where the gases first impinge on the heating surfaces, and the point of inlet of the feed water should be as near as possible to the point of exit of the gases to the main flue. Due recognition of the elementary principle that cold water is of higher specific gravity than hot will tend to better design from the point of view of circulation, and consequently better evaporating qualities.

WRINKLES.*

EDITED BY H. C. ABELL.

Removing Crank Pins.

Some time ago we were obliged to take out and replace a crank pin on a 250 hp. engine. The pin was shrunk in and penned over, as is the custom, but had become a little loose; still we could not force it out.

We drilled a hole through the center of the pin from end to end, tapped each end to fit a three-quarter inch pipe thread, and screwed a piece of pipe in the same with the cold-water hose attached to one end of the pipe. After heating the crank and pin to a cherry red by the use of the portable forge we turned on the water, cooling the pin, which shrunk enough so it could be pulled out by the attached pipe.

C. E. Inman, Warren, O.

Silent Chain-Drive to Replace Governor Belt.

Since it is the duty of a governor on an engine to adjust the supply of steam admitted to the cylinder to suit the load, the medium of transmission of power to drive the governor must act as quickly as possible. It is the duty of the flywheel to take care of the variations of the load instantaneously, while governor adjusts same by controlling the steam—taking a comparatively longer period of time to do so. We also know that under best conditions possible there is belt slippage and furthermore that a belt may break without giving any warning.

---

*Paper presented before the National Electric Light Association at its 28th convention, held at Denver-Colorado Springs, Col., June 6-11 1905.

To overcome these deficiencies we have replaced the governor belt on three engines by a silent chain-drive, and we are well pleased with the change. To do this a special sprocket wheel had to be made to fit over the engine shaft; a sprocket is also made to replace the governor pulley.

The silent chain-drive has four advantages over the belt, in that it cannot slip, it does not stretch, oil does not ruin it, and it is stronger.

G. H. Cushman, San Antonio, Tex.

Curing an Engine that Took Water Frequently.

An engine taking steam from the extreme end of a long line of piping was troubled frequently with water; taking the cap off the end of the steam line and putting on a drop elbow, with a drip from the bottom of it leading to the drip system, cured it.

H. C. Hall,
Fall River, Mass.

Detecting Leak in Receiver.

A receiver drip on a vertical tandem compound-condensing engine was found hot after the engine had been shut down several hours; throttle valve was found to be tight, so the only place left to look was the reheating coil in the receiver. To take head off the receiver was a long, awkward and tedious job, so to find whether the leak was large or small all drips were closed, also valve between engine and condenser, and by noting pressure on receiver gauge the desired information was soon obtained.

H. C. Hall, Fall River, Mass.

Method of Testing a Large Gas Engine Without a Brake.

It was necessary to test a large producer-gas engine, driving a 700 kw., 13,200-volt generator. The only available electric load was too variable to be of any use, so the following arrangement was adopted:

A triangular float, supported by oil barrels at the corners, was constructed with out-riggers supporting high-tension insulators. The three-phase line was led to an upright in the middle of the float and thence one leg to each out-rigger. A short bar of No. 00 bare copper was used as a terminal dipping into the river.

With about ½ inch of the terminals submerged at 20 feet distance, full voltage, full load was obtained.

A comparatively slight variation of generator voltage would vary the load from one-quarter to full, and the same could be held absolutely steady at any point. A perfect load and regulation test was obtained on the engine.

It was observed that nearly all the resistance was at the contacts, the distance apart of the electrodes having no effect from 6 to 20 feet.

At heavy load the electrodes made no contact with the water but were surrounded by a ball of incandescent gas, approximately 2½ inches in diameter, which formed the conducting medium.

M. A. Maxwell.

A NEW TYPE OF SINGLE-PHASE ALTERNATING CURRENT MOTOR FOR ELEVATOR WORK.*

BY G. PERCY COLE.

The employment of electric motors for elevator service has been very general during the last few years, mainly for the following reasons:

There is a considerable saving in the cost of installation of an electric over a hydraulic elevator, since the latter requires pumps and tanks in addition to the elevator mechanism.

The electric elevator requires very little space compared with a hydraulic machine, since the whole mechanism—motor elevator and drum—can be installed at the top of the elevator shaft. A space 6 feet square is usually sufficient.

Operating expenses are not so high, since the simplicity of operation of the electric elevator does not require the attendance of an engineer.

The simplicity of electric-power distribution over hydraulic distribution greatly aids the solution of the problem of control. The electric elevator can be operated by rope or push-button control; the employment of an expert operator is therefore not required. In fact, with this latter method, no operator is needed, since push buttons operating an auxiliary controlling system, which in turn operates the regular controller of the motor, can be placed on each floor.

The large amount of space required by the hydraulic elevator often necessitates the mechanism being placed in an exposed position, thus endangering it by freezing. With the electric motor there is no danger of its freezing up.

The operating expense of an electric elevator as compared with other types is considerably smaller, with the exception, perhaps, of a hydraulic elevator supplied from a central station accumulator, for in the business centers of many of our largest cities a number of hydraulic elevators can be supplied from a central station at a very reasonable figure.

For the foregoing and also many other reasons, the electric type of elevator has found great favor.

The majority of electric elevators now in operation in America employ direct current motors, the usual pressure of supply in the business centers being 220 volts, and in the outlying districts, 500 volts. Polyphase motors, fitted with slip rings and resistances for variable-speed work, are used to a small extent in this country for operating elevators, but their operation cannot be considered to be at all satisfactory. This is chiefly due to the very great disturbing effect on the line that is inherent to the polyphase induction motor when thrown on the full line voltage. Being essentially a constant speed motor, so unsuited is the polyphase induction motor to the heavy requirements of elevator service that it is extremely unlikely that engineers will try to develop it further in this direction. Elevator service demands a fair amount of torque with reasonable starting currents, and the polyphase induction motor alongside of the continuous current motor, in these respects makes a very poor showing indeed.

In New York City the proportion of direct current motors to polyphase induction motors operating elavators is in the ratio of 10 to 1, the polyphase motors being employed chiefly in those sections of the city where it is at present impossible to obtain a direct current supply, and the constructors of elevators have had no alternative but to employ polyphase induction motors.

In many of our largest cities we now find the power companies changing over whole sections from direct to alternating current supply. In fact, in many cities we already find large areas where direct current cannot be had at any price. If, therefore, the electric elevator is to retain its hold, it is imperative that we have a first-class and thoroughly reliable alternating current motor. As either polyphase or single-phase currents are frequently available, the central station could often connect their type of motor. But as elevator service usually calls for motors of relatively small individual capacity, there are many reasons why service can be given to better advantage single-phase than polyphase. This fact has been recognized by central stations and also by manufacturing companies, and for a good many years a most energetic effort has been made to develop a form of single-phase motor construction suitable for this work. Such a motor, to be entirely satisfactory, should possess the starting characteristics of the direct current series motor and the running characteristics of the direct current shunt motor. Designers have struggled in vain with this problem until quite recently. A type of motor is now available, however, which affords practically all of the desirable characteristics of the direct current elevator motor, and it is this motor which the writer desires to briefly describe.

---

*Abstract of paper read before the National Electric Light Association at its 28th convention, held at Denver-Colorado Springs, Col., June 6-11, 1905.

This motor is the invention of Mr. Leo Schuler, an electrical engineer of Frankfort, Germany. In construction it is a combination of the repulsion and induction forms of single-phase motors. Mechanically, the motor consists of an ordinary induction motor frame. It has an ordinary induction motor stator core, built up of laminated sheet steel. The stator winding consists of form-wound coils, distributed in slots around the inner periphery of the stator core. The motor is built up of laminated steel in the same way as the stator, and carries a progressive wave winding similar to the usual direct current armature; on one side is provided a commutator, and on the other side three collector rings connected into the winding in polyphase relation.

In operation, the first effort of rotation is secured with connections corresponding to the well-known repulsion motor. After the armature has attained about one-quarter speed the polyphase resistance, connected to the armature through the slip rings, is thrown in and gradually short-circuited as the armature runs up to full speed. The brushes bearing on the commutator in the usual elevator equipment are not completely short-circuited, but have a fixed resistance interposed between them; at no time are the brushes removed from the commutator.

As you are all aware, the repulsion type of motor has starting characteristics very similar to those of a direct current series motor; that is, a very heavy torque is secured at the first instant of starting. This torque decreases rapidly as the speed increases. Correspondingly the current taken by the stator winding from the outside supply circuit also decreases rapidly, and this is also the case with the current through the repulsion brush circuit. On the other hand, in a single-phase induction motor the torque on the rotor at rest is zero, but increases gradually to a maximum as the speed increases toward full speed. By making use of a combination of these torques, the inventor of this motor has developed a machine that has exactly the torque characteristics necessary for elevator and hoist service, and has substantially combined in a single machine two heretofore well-known forms of single-phase motors. Torque at any speed, it will be seen, is approximately equal to the sum of the torques due to the repulsion effort on the commutator end of the motor and to the induction motor effort on the slip ring end of the motor.

Elevator service usually requires from 40 to 50 per cent. of full-load torque at the first instant of starting, and the most satisfactory types of direct current elevator motors provide this torque with a first rush of current not to exceed 50 per cent. in excess of the full-load running current. In other words, a good motor for electric elevator work should develop the same torque per ampere of starting current as is developed per ampere of running current. The single-phase motor described in this paper is capable of a development of such a starting efficiency; in fact, by a suitable arrangement of starting resistance it is quite possible to secure a starting torque per ampere appreciably in excess of the running torque per ampere. One of the novel features of this motor is that it is capable of speed control for quite a percentage of its speed range by regulation of the polyphase resistance. It has been experimentally found that successful regulation, down to as low as half-speed, can be secured without trouble—the motor acting electrically as would a series direct-current motor under armature resistance control.

This motor may properly be called a repulsion induction motor since it starts as a repulsion motor, and runs practically entirely as a single-phase induction motor.

An outfit consisting of one of these new single-phase elevator motors direct coupled to an elevator mechanism fitted with rope control has been in practical service over a period of five or six months, and has operated with extremely satisfactory results. Electric control mechanism has not as yet been developed by the manufacturers, but these features will be brought out as adaptation of the motor to prevailing forms of standard elevator construction is effected in cooperation with the various prominent elevator manufacturers of the country.

There has been considerable inquiry as to the amount of sparking developed on the commutator of these equipments. The writer may say that the sparking is practically nil. The life of the commutator is predicted to be equal to that of best direct current elevator motors.

Among the more conspicuous advantages of this motor over other types used for elevater work may be enumerated the following:

1. In this type of motor it is not the line current but simply the induced armature current that is being commutated. This allows of the primary stator winding being wound, say, for any convenient pressure up to 1,000 volts.

2. Control can be from a distance since only a throw-over switch is required to reverse the motor.

3. Being a single-phase motor, the simplicity and lessened first cost of the supply circuit distribution bear very largely on the cost of the installation.

4. The commutator can be kept very small since it is only traversed by a large amount of current during the starting period, and when under full speed takes practically no current.

5. Since the load is not applied abruptly to the circuit, but gradually, this elevator motor may have its supply circuit attached to the same transformer carrying lights without affecting the lights.

6. The power factor of the motor is quite high, being about 80 to 85 per cent. both in starting and running speed. It is worthy of note that in polyphase induction motors used for this same service, although a high-power factor is shown at starting the average running power factor is only 36 per cent., showing that the polyphase motor when used for elevator service was much larger than the average conditions would call for, but it is necessary to provide this capacity in order to accommodate any heavy loads that must occasionally be carried, and to provide sufficient static torque. The high-power factor at starting of the polyphase motor is simply due to the enormous copper loss due to the heavy starting currents.

7. This motor is capable of standing heavy overloads. It will develop from 50 to 60 per cent. overload for short intervals without injury to the windings.

8. Low starting current, which is inherent in this type of motor, makes it possible to operate it from one leg of a two or three-phase circuit without unbalancing the circuits.

In conclusion, I may state that we be-believe we have in this motor one that is in every respect the equal, and in many ways the superior, of the best type of direct current elevator motor. Its characteristics are such that the acceleration can be made anything desired. The field that it will occupy is indeed very broad. The need of a practical, variable speed, alternating current motor has long been felt and it is my belief that the motor described will supply that want.

Electrical Resistance.

At the annual meeting of the North of England Institute of Mining and Mechanical Engineers, recently held at Newcastle, a paper by Mr. G. C. Wood was presented giving the results of a year's work in determining the specific electrical resistance of coal and various ores. The electrical resistance of coal was found to be so high that it may be considered to be a very fair insulator, a fact of practical value in connection with electrical work underground.

It was remarked in discussion that coal had a much higher resistance than Barton ballast, which had lately been discovered by the North-Eastern Railway to be particularly effective in preventing the return of the electric current to earth.

International Street Railway Convention.

During the week beginning September 25, Philadelphia will be the center of attraction for electric railway men and all those who make supplies for such lines. The occasion will be the annual convention of the International Street Railway Association.

About 800 delegates and others are expected to be present. E. M. Brady of New York is president of the association, and T. C. Pennington of Chicago is secretary. Headquarters will be in the Bellevue-Stratford, and the business meetings will be held in the ball-room and the Clover Club room.

This association consists of officers of electric railways all over the United States. Equipment and electric supply companies are also members. The purpose is to bring the various interests together for an exchange of views and to discuss practical methods of improving electric railways and the service they give.

In connection with the convention there will be an exhibition of electric appliances, street railway cars, etc. This will be at the Commercial Museums, where space has been arranged for.

Proposals Invited.

The Navy Department at Washington, D. C., through the Bureau of Supplies and Accounts, is inviting sealed proposals until September 5 for furnishing the Boston, New York, League Island and other Eastern Navy Yards with the following electrical material: Schedule 82, arc lamps, lamp cord, wire; schedule 83, motor; electrical supplies, electric smoothing irons; schedule 84, starting rheostats; schedule 86, electrical equipments for rammers, etc.; schedule 89, Okonite tape. On August 29 the Bureau will open bids for furnishing Eastern Navy Yards with the following: Schedule 71, telephone cable; schedule 73, battery cells, cable; schedule 75, electric glue heaters. On September 19 the Bureau will open bids for furnishing Western Navy Yards with the following: Schedule 77, motors; schedule 78, circuit breakers, electric wire, ammeters, resistance ribbon; schedule 79, motors. Specifications and blank proposals for all the above supplies may be obtained on application to the Bureau. Applicants should designate by number the schedule desired. Those for Eastern yards may also be secured at the Navy Pay Office in New York.

To Manufacturers and Exporters.

The Department of Commerce and Labor at Washington, is desirous of securing the co-operation of manufacturers and other persons interested in the efforts being made by that Department through the Bureau of Manufactures, to extend the foreign trade of the United States.

In furtherance of this work, it is proposed to establish a comprehensive card index which will enable the Department, upon application, to furnish information desired by manufacturers, or by intending purchasers, and it is contemplated to extend the system, if the necessary authority shall be granted by Congress, to the principal consulates.

To enable the Bureau to prepare such an index manufacturers and exporters are requested to furnish briefly any information which they may desire to have recorded in connection with their business. The Department will, upon request, furnish a blank form for filling in.

A Tenth Anniversary Celebrated.

The Pawtucket Association of Stationary Engineers of Pawtucket, R. I., one of the most progressive and energetic bodies where education in the science and art of steam engineering is its principal motto, celebrated its tenth anniversary on August 20. A genuine Rhode Island shore dinner was served in the Palace Gardens on the west shore of Narragansett Bay and everyone thoroughly enjoyed himself.

ELECTRICAL PATENT RECORD.

LETTERS PATENT ISSUED AUGUST 15, 1905.

Electric Railways and Appliances.

797,141. Block-Signal System for Electric Railways. Frank R. McBerty, Evanston, and Malcolm E. Launbranch, Chicago, Ill., assignors to the Western Electric Company. Filed Sept. 9, 1904.

797,180. Electrical Safety Apparatus for Signaling on Railways. Henri Coulin, Paris, France, assignor to the Societe Cousin & Co., same place. Filed April 3, 1905.

797,229. Car-Fender. William B. Rohmer, Bay St. Louis, Miss. Filed Nov. 7, 1904.

797,252. Electric Switch. Milan V. Ayres, Newton, and Daniel E. Hennessy, Everett, Mass. Filed Feb. 9, 1905.

797,254. Means for Transmitting Electricity to Vehicles on Electric Railways. Attilio Beer, Venice, Italy. Filed Aug. 18, 1902.

797,342. Trolley-Wheel. Frank E. Bryan, Niles, O. Filed Dec. 24, 1904.

797,355. Trolley-Mounting. George E. Henry, Vincennes, Ind. Filed Nov. 9, 1904.

797,394. Third-Rail Guard. Melchior Zugermayer, East Rutherford, N. J. Filed April 19, 1905.

797,490. Insulated Railway-Rail Joint. Bancroft G. Braine, Brooklyn, N. Y., assignor to the Continuous Rail Joint Company of America. Filed July 23, 1902.

Electric Lights and Appliances.

797,090. Lamp-Socket. William Uschmann, Schenectady, N. Y. Filed June 1, 1904.

797,250. Guard for Incandescent Electric Lamps. Charles P. Anderson, St. Louis, Mo. Filed March 17, 1905.

Electrical Machinery and Apparatus.

797,015. Induction-Arrester. Edward C. Paramor Philadelphia, Pa. Filed Dec. 1, 1904.

797,048. Circuit-Breaker. Harry P. Davis, Pittsburg and Arthur B. Reynders, Wilkinsburg, Pa., assignors to the Westinghouse Electric & Manufacturing Company. Filed Feb. 27, 1904.

797,049. Electrical Terminal Connection. Isaac De Kaiser, Wilkinsburg, Pa., assignor to the Westinghouse Electric & Manufacturing Company, File Nov. 21, 1903.

797,050. Insulator. William W. Dunsmore, Falconer N. Y. Filed Aug. 24, 1904.

797,065. Electric Switch. Benjamin S. Luther, Boston Mass., assignor to the Chase-Shawmut Company Newburyport, Mass. Filed April 4, 1904.

797,060-061. Controller for Alternating-Current Apparatus and Electric Motors. Ray P. Jackson, Wilkinsburg, Pa., assignor to the Westinghouse Electric & Manufacturing Company. Filed June 6, 1904 and Jan. 23, 1905.

797,198. Automatic Electric Cut-Off. Roy M. Griffith Elwood, Ind. Filed Jan. 16, 1905.

797,215. Plug-Box for Electric Circuits. Henry G. Osborne and Edward Richter, New York City. Filed May 23, 1904.

797,217. Operating Mechanism for Controllers. William D. Pomeroy, Norwood, O., assignor, by mesne assignments, to the Bullock Electric Company. Filed Dec. 8, 1903.

797,271. Electric Switch. Gano S. Dunn, East Orange, N. J., assignor to the Crocker-Wheeler Company, Ampere, N. J. Filed Aug. 25, 1903.

797,396. Electric Motor. Ralph E. Barker, Lynn, Mass., assignor to the General Electric Company. Filed Oct. 26, 1903.

797,433. Electric Switch. Edward M. Hewlett Schenectady, N. Y., assignor to the General Electric Company. Filed Nov. 4, 1904.

797,498. Block Signal System. Fred B. Corey, Schenectady, N. Y., assignor to the General Electric Company. Filed Jan. 21, 1905.

797,517. Measuring Instrument. John H. Kimball Lynn, Mass., assignor to the General Electric Company. Filed Aug. 25, 1904.

797,518. System of Electrical Distribution. Sigvald Krohn, Berlin, Germany. Filed Nov. 2, 1899.

797,526. Switch. Frank R. McBerty, Evanston, Ill. assignor to the Western Electric Company, Chicago, Ill. Filed Dec. 21, 1903.

Miscellaneous.

797,110. Storage Battery. Gustave K. Hartung, New York, City. Filed April 30, 1904.

797,424. Electric Fire-Alarm Apparatus. Eugene Fuller, Arctic Center, R. I. Filed Jan. 28, 1905.

797,544. Space Telegraphy. Ferdinand Braun, Strassburg, Germany. Original application filed Feb. 6, 1899. Divided and this application filed May 13 1903.

THE TELEPHONE WORLD.

Telephone Company Purchased.

All the property of the Standard Telephone & Telegraph Company was sold about 10 days ago by order of the court by the Bucks County Trust Company, trustees under the mortgage, to Reynolds D. Brown, of Philadelphia, Pa., for $50,000. After the sale Mr. Brown refused to give any information regarding whom he represented. It was reported that he acted for the Keystone Telephone Company.

The purchase price, bondholders said, is about 25 per cent. of the cost of the system. Among the bidders were several Lancaster financiers and Treasurer Elkins, of the Colonial Trust Company, Philadelphia, who represented the bondholders' committee. It was said that representatives of the Bell Company were present, but offered no bids.

This company, which went into the hands of a receiver a few months ago, has been operating less than four years. On account of competition and low rates, the company was not able to meet its current operating expenses or to lay aside a fund to offset depreciation of its plant.

Chicago to Use Its Own Telephones.

The Chicago Telephone Company will no longer receive $2,131 a year rental for the instruments which it supplies for Chicago's police and fire telephone system. That city intends to use its own apparatus. City Electrician Carroll had a conference with Mayor Dunne and advocated city ownership of the instruments. The contract with the telephone company is a verbal one, and Mr. Carroll will at once notify the company that it will be terminated as soon as the city can install its own apparatus, which it is estimated will cost $7,000.

Flemington, N. J., has a telephone war. A few days ago the Pennsylvania Telephone Company sent men to remove the wires of other companies, excepting those of the Lebanon Telephone Company and the fire alarm system, from its poles. The men soon had many wires down, badly crippling the telephone service in Flemington, and depriving some sections of the town from electric light. An investigation by local authorities showed that the Pennsylvania Company occupied some streets not covered by its franchise, and that the Lebanon Company, its agent, was operating without any franchise whatever. The village trustees have ordered the Lebanon Company to remove all its wires and poles, and the Pennsylvania Company was directed to vacate all streets not included in its franchise. Drastic action will be taken if the orders are not obeyed.

The American Telephone & Telegraph Company's report of instruments installed and in use during the month of July shows an increase of 13,412 over the corresponding period of last year, and from January 1 to July 31, an increase of 282,996. The total outstanding on July 31, was 5,145,560, against 4,161,517 last year, an increase of 984,043.

Shareholders of the United Telephone & Telegraph Company will vote September 29 upon a proposed increase of the indebtedness from $2,000,000 to $2,350,000.

Telephone Improvements Planned.

The possibility of a new telephone company being formed in Benton Harbor, Mich., by Detroit capitalists, which was mentioned in the issue of ELECTRICITY for August 16, has stirred the board of directors of the local Independent line to action and they have announced that in the next few months not less than $25,000 would be expended in repairs and improvements on the line. The Independent line has over 1,000 'phones in Benton Harbor, and gives connection with 500 'phones of the Bell Company in Detroit, but the service has been abominable and beyond the capacity of the company that thought when it formed the organization that 500 'phones would be all it would ever have in operation.

A recent report from the Stromberg-Carlson Telephone Manufacturing Company of Rochester, N. Y., states that contracts for switchboards have been closed for the following places: Auburn, N. Y.; Bird City, McDonald and Center, Kan.; Coldwater and Arcadia, Mich.; Hannah City, Mulkeytown, Tonica and Lostant, Ill.: Pitman Grove, N. J.; Lewisport, Ky.; Huntingburg, Ind.; Ormsby, Minn.; Seattle, Wash.; Sinclair, Tex.; Mexico, Mo.

Warren H. Girvin, general superintendent of the Central New York Telephone & Telegraph Company, and the Empire State Telephone & Telegraph Company, has tendered his resignation. W. W. Nicholson, who has been assistant general manager of the company with headquarters at Utica, will succeed Mr. Girvin as general superintendent, and the office of assistant general manager, it is said, will be abolished.

Several farmers living southeast of Oak Grove, Mo., are building a telephone line of their own into that town. They have named it the Texas Prairie & Oak Grove Telephone System. By doing much of the work themselves and furnishing most of the material it is estimated that the line will not cost more than $20 per mile.

The stockholders and directors of the Ashville & Panama, N. Y., Telephone & Telegraph Company held a recent meeting at the law offices of Frank H. Mott, and at this meeting these officers were elected: President, G. H. Appleby; vice-president, A. J. Peterson; secretary and treasurer, A. H. Appleby.

It is announced that the Colorado Telephone Company will build telephone buildings in Florence and Canyon City, the construction to begin early next year. About the same time the company will begin rebuilding the entire system in these two cities, and will install the central energy system.

The Ontario, Cal., trustees have decided to advertise for sale a franchise for a telephone line into Ontario.

The sum of $1,000,000 is to be spent by the Zenith Telephone Company of Duluth, Minn., in enlarging its system.

To Increase Automatic 'Phones.

Early in October it is expected that the Illinois Tunnel Company of Chicago will have its bores under the river, connecting the South side with the North and West sides. With the completion of this work Mr. Wheeler says the installation of the automatic telephone will be extended to West and North side subscribers. At the end of five years from the time of the granting of the franchise the company is required by the terms of its ordinance to have 20,000 telephones installed. It has now approximately 10,000. The company is also installing desk or extension instruments. In certain lines of business, where the automatic instrument is known to be in use, it has won much favor from subscribers.

The Secretary of the Interior has entered into a contract with E. A. Hess, of Lyons, Ia., for the construction of a telephone system in connection with the Fort Buford reclamation project in Montana and North Dakota. This system consists of four telephone stations and about 70 miles of pole line.

The Dosbaugh Telephone Company having its headquarters at Sedan, Kan., recently changed its lines from ground to metallic circuits. This company has exchanges at Caney, Peru, Elger, Sedan and Cedar Vale, making about 1,000 subscribers, and represents an investment of about $85,000.

Since deciding to increase the capital stock of the Sandusky, O., Telephone Company to $150,000, the stockholders have concluded to arrange for a refunding of the present indebtedness of the company. A new bond issue will be made to take up all outstanding bonds.

It is said that since the Independent company of Beatrice, Neb., began business there, that the telephone service has been much improved. There are now more than 500 telephones in use by that company.

The Farmers' Mutual Telephone Company of Washington County, Ill., has been formed with a capital of $1,000, to operate a telephone system. The incorporators are J. J. Randall, C. H. Ruhrmester and J McDowell.

The Michigan Telephone Company is extending its line from Bessemer to Sidnaw to connect the Gogebic range with Marquette and the copper country.

The capital stock of the Home Telephone Company of Mobile, Ala., has been increased to $350,000; the sum of $200,000 of this amount will be spent in improving its system.

The capital stock of the Home Telephone Company of Joplin, Mo., was recently increased to $750,000.

An order has been sent out by the Dayton, O., city authorities that all telephone wires are to be placed underground.

The Patterson Telephone Company is building a line into Newport, Ark.

GENERAL ELECTRICAL NEWS.

LIGHTING.

Alvarado, Tex.—The McQuatters Machine & Plumbing Company of Hillsboro has purchased the plant of the Alvarado Light & Power Company, and will enlarge and improve it.

Burlington, Wis.—At a special election in this city the proposition to vote $12,000 for a municipal electric lighting plant was carried.

Calhoun, Ga.—George C. Chambers will erect an electric light plant here to furnish 500 incandescent and 10 arc lamps.

Dublin, Ga.—This city is preparing to improve its electric light plant. The system will be changed from a high to a low frequency. The total cost of the change amounts to $4,000. The change includes a 200 kw. alternator. The voltage will be increased to 2,300 for the incandescent lights and 3,300 for arc lights.

Elm Grove, W. Va.—The Wheeling & Elm Grove Railway Company will make extensive improvements to its plant, installing a complete electric lighting equipment.

Gilroy, Cal.—By a vote of 10 to 1 it was decided to issue $51,000 in bonds for the purpose of constructing sewers, providing water and electric lights and completing the city hall.

Milford, N. J.—W. E. Thomas will establish an electric light plant here to supply both arc and incandescent lights.

Monroe, Ga.—President Joseph S. Walker, of the Electric Supply Company, has closed a contract with the municipal authorities of this city for a complete electric lighting plant. The plant will be the largest lighting outfit in any of the smaller towns in the State, the estimated cost being $20,000. It is proposed to generate current for 4,000 incandescent lights.

Port Townsend, Wash.—A company composed of local capitalists, who was refused an electric light and gas franchise by the city council at the last session, is negotiating with the Port Townsend Electric Company for the purchase of its plant and franchise.

Radford, Va.—The Grayson Electrical Corporation will build a power house at Graysontown, eight miles from here, which will light the towns of Christiansburg, Childress and Riner, and furnish power for a contemplated trolley line from Cambria to Christiansburg, besides such factories as may be established along the line.

Richmond, Va.—H. R. Pollard, Jr., has introduced a resolution before the common council, asking that the matter of erecting a city electric plant be decided by vote of the people.

Rome, Ga.—The City Electric Light Company, of which C. N. Fuller is superintendent, will make improvements to the plant.

San Antonio, Tex.—C. A. Zilker is mentioned in connection with plans for the organization of a company to build another electric light and power plant.

Silver City, N. M.—A franchise has been granted by the city council to George T. Schmelzer and others, who will immediately commence the construction of an up-to-date electric light plant in this city.

St. Augustine, Fla.—The St. John's Light & Power Company has been incorporated with a capital stock of $300,000. to operate an electric light and power plant.

Wadena, Minn.—The city council has recently secured figures on a modern building for the electric lighting plant in this city.

West Branch, Mich.—The electric light and power plant here has been sold to W. W. Vaughan of this city.

STREET RAILWAYS.

Blanchester, O.—The Cincinnati, Milford & Loveland Traction Company, known as the Kroget line, has issued $500,000 of bonds to extend its line to this city.

Brownwood, Tex.—A movement is on foot to build an electric line from this city to Rising Sun.

Claremore, I. T.—A charter for an electric street railway here has been granted to T. S. Chambers, of Blackwell, Oklahoma.

Cleveland, O.—Max Goodman says concerning his Mahoning County traction proposition that he will erect a power house at Teegarden within a short time.

Danville, Va.—There is some talk among North Carolina financiers of building and operating an electric railway line between this city and Yanceyville, N. C.

Georgetown, Col.—E. J. Wilcox, of the Waldorf Mining Company, has under consideration the building of an electric road, which will mean much for Upper Clear Creek.

Joliet, Ill.—Plans for the new electric railway between this city and Wilmington are nearly perfected, and actual work will be commenced in the very near future.

Lorain, O.—In pursuance of its plan to build a belt line to this city the Cleveland & Southwestern Traction Company lately applied to this council for a franchise on certain streets in the western portion of the city.

Marlin, Tex.—Farmers in the section of country between this place and Temple, through which the proposed interurban trolley railway would run are very much interested in the matter, and are anxious that this line be extended from Temple to Marlin.

Newark, O.—After months of expectancy upon the part of business people of this city. the proposed Newark, Martinsburg & Mt. Vernon Street Railway Company has presented a petition to the city council asking for a franchise for the tracks in the streets of this city.

Paris, Ill.—Charles F. Probst lately returned from Chicago, where he was in conference with several capitalists, and says that work on the roadbed of the proposed Paris electric line will be commenced the first of next month.

Peotone, Ill.—A franchise for an electric road through this village has been purchased.

Philadelphia, Pa.—The Germantown & Chestnut Hill Belt Line Railway Company is to form part of an electric line from this city to Trenton.

Spearfish, S. D.—The Black Hills Traction Company has been incorporated to build a trolley line between the towns in the Black Hills.

Toledo, O.—The Lima & Toledo Traction Company has increased its capital from $50,000 to $3,000,000. W. K. Schoepf, of Cincinnati, is president.

Utica, N. Y.—Work will commence in one week on the electrification of the West Shore Railroad between Syracuse and this city.

POWER PLANTS.

Anderson, S. C.—The stockholders of the new Hatton's Ford Power Company recently affected a formal organization by electing the following officers: R. S. Ligon, president and treasurer; J. A. Brock, vice-president, and J. C. Green, secretary. Hatton's Shoals is 16 miles from this city on the Tugaloo River, near its confluence with the Savannah. It is estimated that 6,000 hp. can be developed. The company is capitalized at $150,000, and will develop power for lighting and manufacturing purposes. Work on the plant will begin at an early day.

Pomona, Cal.—Farmers and orange growers in this vicinity are organizing a company to build an electric power plant, with which they expect to furnish power for all pumping plants in the vicinity, and operate a trolley belt line, connecting all the nearby towns and ranches.

York, Pa.—A mortgage for $10,000,000 was filed in the recorder's office here last week to secure a bond issue to be made by the McCall's Ferry Power Company, a corporation of New York capitalists, who purpose building a power plant on the lower Susquehanna River, near McCall's Ferry, Pa. The Knickerbocker Trust Company of New York is named in the mortgage as trustee for the bondholders. The mortgage covers real estate along the river in York and Lancaster Counties, Pennsylvania, and Cecil and Harford Counties, Maryland, as well as securities in companies that have been consolidated in the power company.

BIDS WANTED.

Washington, D. C.—Proposals will be received at the Bureau of Supplies and Accounts of the Navy Department, until August 29, for the delivery and installation of three water tube boilers and machinery for the power house at the Naval Hospital. Blank proposals will be furnished upon application to the Bureau, H. T. B. Harris, Paymaster General, United States Navy.—Sealed proposals will be received by the Department of the Interior at the office of Elliott Woods, Superintendent of the United States Capitol Building and Grounds, until September 30, for furnishing all material, labor and other appliances, and erecting and putting in operation, in a building and on foundations to be provided by the United States, and in locations within the Capitol Building, Congressional Library Building, and Senate and House Office Buildings, now under consideration, a complete heating, lighting and power plant, including machinery, boilers, piping, electrical transmission, cables and conduits, appliances and all other equipment in said power house building, and in the other buidings named. Thomas Ryan, Acting Secretary.

Winnipeg, Man.—Sealed tenders addressed to Alderman J. C. Gibson, chairman of the fire, water and light committee, will be received until 3:30 P.M. August 28, for a 500 kilo watt electric generating plant.

NOTES FOR INVESTORS.

Latest quotations for copper are: Electrolytic, 15¾@16c.; Lake 15¾@16c.; casting, 15⅜@15⅝c.

Mayor Dunne and the Chicago street car companies failed to agree on anything at the recent conferences.

The Hudson Tunnel Company is negotiating with the Public Service Corporation of New Jersey for power to operate its cars under the river.

The Chicago & Milwaukee Electric Railroad Company announces that it will open the Zion City extension of its Evanston-Waukegan line August 26.

A Philadelphia official of the Electric Company of America says that the earnings are showing good increases over last year, especially the Atlantic City lines.

For the first twenty days in August the reported earnings of the Boston & Worcester Street Railway Company show an increase of 20 per cent. over August of last year, which is double the estimated increase.

The General Electric Company has purchased $100,000 of the bonds of the Bristol Light & Railway Company, a Virginia concern, the securities of which corporation are listed on the Washington, D. C., Stock Exchange.

It has often been noted that in active bull markets Westinghouse Electric crosses General Electric's price. Dealers in Westinghouse say that it is rather mysterious why the stock is now selling 14 points below General Electric.

Interests connected with the New York Air Brake Company have secured control of the United States Light & Heating Company, a concern which aims to furnish electric light and heat to railway cars by the Moskowitz system of transmitting power from the axle.

It is indicated by the quarterly report of the Interborough Company that not fewer than 300,000 persons traveled on the New York Subway every day on the average, although it is not possible to get the exact figures for the time the underground road has been in operation.

The Lehigh Valley Traction, the Philadelphia & Lehigh Valley, Allentown & Slatington, Copley and the Egypt & Ironton Companies have been consolidated into one traction system, to be known as the Lehigh Valley Transit Company. The total capitalization is $20,500,000.

Municipal ownership advocates received a severe blow on Saturday by a decision rendered at Indianapolis by Judge Francis E. Baker, of the United Circuit Court, holding that cities have no power to take over the property of public utility corporations, even when the right is stipulated in the franchise.

President Winter of the Brooklyn Rapid Transit Company informs large stockholders that if the directors of the company will give him one more year to work out the Brooklyn transit problem, without restricting his expenditures for the improvement of the property, there will be no longer any question as to dividends for the stock for years to come.

Four Boston-controlled traction properties in Indiana and Ohio have been sold by the owners to the United Gas Improvement Company of Philadelphia. The four are the Indianapolis & Northwestern Traction Company; the Columbus, Buckeye Lake & Newark; the Indianapolis & Western, and the Columbus, Newark & Zanesville, all built and managed by Tucker, Anthony & Co. It is understood that the sale involved the transfer of about $14,000,000 in cash and securities. The stocks were all sold for cash.

EDITORIAL NOTES.

The Returns from Engineering. The returns from engineering seem all on one side, so far as the average engineer is concerned. There are three phases of money-making involved in the art and practice of engineering: first, the professional end, consisting of consultation or the employment of such knowledge as is of a purely technical or scientific nature; second, the manufacturing end, in which devices are made to fill certain prominent demands, and third, the constructive or installing end, in which contracts are filled as indicated by certain specifications. There might be a fourth, but it could not belong to engineering, although the result of it. This is the position of the stock or bondholder of an electric company. His attitude is purely passive, yet his interests are better protected and larger than the returns of those representing the *deux machina.* The engineer is not a well paid man, as may be judged from his modest income and superfluity of knowledge pertaining to his science. In law, medicine or the practice of some other crafts, the remuneration is immense in comparison, but the difficulty is largely one which relates to the employment of the knowledge. If we were all masters there would be no workers, and for this reason the cultivation of these talents, which lead to a superior aptitude in management or invention cannot be discovered in more than a few. The few are thus financially more successful than the many. The few are the representatives of the profession simply because they possessed superior qualifications. But take the knowledge, skill, judgment and intellectuality of the best of consulting engineers or even of the so-called practical engineers, those that head the largest of corporations, and compare their returns with the flood of wealth circling around the doors of the eminent lawyer or physician. The public judgment seems to be biased. They are accustomed to paying the engineer badly. The combination of the commercial with the technical is unquestionably most productive, yet those not born with business ability, those in fact from whom the greatest gifts the world has received have come, are not given an equal show. Competition may be used as an argument but it must be remembered that it applies to all professional fields as well. It might be suggested by the thoughtful, that all doctors and lawyers are not well paid. This is not the point, however. The tribute paid to engineering knowledge and its concomitant responsibilities is not equitable. The returns from engineering are not in proportion the equivalent of those yielded to others, not more skillful or useful to the community than the engineer, and certainly not as indispensable.

* * *

Public Utilities and Their Unsightliness. There is nothing condemnatory in the opinion expressed that many of our public utilities are unsightly. The conflict has ever been waged between the purely practical man and the owner of artistic sensibilities. The French regard appearance as of equal importance to existence, and in consequence have made it a criminal offense to offend the public taste by unsightly structures. An art and building commission combined pass upon the structures to be erected, and it is their decision which controls the architectural beauty of Paris. We only express our protests in a plutocratic form. Complaints against unsightliness in things about the city rarely if ever come from the poor. They generally emanate from the richer classes of society, to whom the preservation of good appearances is historically a matter of greater importance, and it may be added, it is more within the circle of their activities to give time to the consideration of such matters. On the other hand, the risks arising through the continued presence of unsightly objects, such as poles and wires—of shock and injury—have been determining factors.

The town of Somerville, N. J., has suggested a condition of affairs along the lines indicated, and the public press have made news of the situation. The New York "Sun" states as follows: "The rich folk of the New York colony do not like to see telephone and electric light poles along the country roads, and they are taking action to have all wires placed underground." The notification of the electric light company, by the members of this colony, that it must desist from what they consider to be a desecration of their surroundings, gives rise to an interesting condition of affairs. It can be readily perceived that the expense involved in carrying out a project of this kind, namely, the interment of the wires, which would include those of the telephone company as well, would mount up to comparatively high figures. The fact that this expense would have to be incurred solely for the purpose of satisfying the æsthetic tastes of this community, does not seem just. The possibility of the expense of this enterprise being properly divided up between the individual colonists and the electric light and telephone companies, is the other issue presented. As far as the correct view of what would be considered adjudication is concerned, these matters will adjust themselves eventually with satisfaction to both parties. But the further ultimatum, that the colonization of Italians in the district and the erection of trolley roads will not be permitted, brings us face to face with a phase of fanaticism that overrides all our American traditions. These sporadic outbursts of æstheticism would be just if they represented a national feeling. But the question of utility is the most important one in the public mind. That necessity knows no law is to some extent the watchword which determines much of American success. The validity of a claim, presented by a limited community against the introduction of modern utilities in the customary manner, must be weighed with reference to the nature of the community, and the influence of a checkmate upon the potential growth of other communities. If appearances can be improved upon, where wires are laid, it is far better to start with this idea in the first place. But who but the supersensitive complain about wires stretched along country roads. And when we consider the value of the trolley to the suburbanite of limited income the element of injustice seems very apparent.

It will be interesting not only to see the outcome of this argument, if taken to court, but to see to what extent the battle will be waged by the more practical interests involved.

UNDER THE SEARCHLIGHT.

Notes and Comments on Various Topics.

An official trial was made about two weeks ago at Dover, England, of the systems of submarine signaling by bells under water, inaugurated by the Submarine Signaling Company of Boston. The trial was successful, the strokes of the bell being distinctly heard at a distance of three miles.

◆

A cable dispatch from Brussels, August 26, says that actual work has been started on the construction of the fastest long-distance railroad in the world. The road will be run from Bussels to Berlin via Cologne and trains are to be run at a minimum speed of 120 miles an hour. The track will be without a single curve, and the motive power electricity. The amount contributed by the Belgian Government toward the cost of construction and equipment will be $11,250,000,

An imperial edict declares that telephones and wireless telegraphs throughout China are Government monopolies.

◆

A dispatch from San Francisco says that a new wireless instrument weighing only 1½ pounds and found by exhaustive tests to give better results than the more cumbersome machines now in use, has been invented at the Benicia Barracks by Hugh Annis, a young soldier of the Signal Corps.

◆

Consul Shank, of Winnipeg, Canada, reports to the State Department at Washington that scientific circles are interested in the discovery of a process for welding copper, which has been made by a Winnipeg blacksmith. It is said the process has been thoroughly tested and found perfect, and that copper can be welded to copper or other metals without impairing the electrical conductivity and other properties of the metal. The process is said to be very simple and not more costly than the welding of steel. The work can be done with a forge, a blowpipe or any other apparatus which will heat the metal cherry red.

◆

There is said to be a strong tendency in Germany to abandon the conduit and storage battery system in favor of the overhead trolley for street railways, principally for reasons of economy. Mixed working by trolley and cars provided with storage batteries is retained only in Dresden, while trolley working in conjunction with sections of conduit line exists in Berlin, Dresden and Dusseldorf. The reliability of the conduit system, as compared with that of the overhead trolley line, leaves much to be desired, according to German experience, so that its entire substitution by the last-named is apparently only a question of time.

◆

A cable dispatch says the municipality of Vienna has decided that all public clocks shall be regulated by electricity. The current will be sent by the wireless system fron a central station to 80 small receiving stations scattered about the city and will then be transmitted by wire to the clocks. The municipality will regulate clocks in private houses in the same manner, charging a small fee for the service.

A London cable says that Charles T. Yerkes went to Paris Saturday, He has had a wonderful recovery in health after having been given up by two eminent specialists.

AN ELECTRIC AERIAL FERRY.

BY FRANK C. PERKINS.

The accompanying illustration shows a most unique and interesting type of bridge of American construction, known as the aerial ferry, as it is now in operation crossing the Duluth Ship Canal, through which passes annually twice the commercial tonnage that is carried through the famous Suez Canal. For the past two decades the city of Duluth has been endeavoring to find a safe, practical and economical method of carrying passengers across the canal. Plans were prepared for a bridge over the canal at a cost of somewhat less than $500,000, and tunneling was also proposed, but the estimate of cost was so high that the scheme was dropped immediately as the plan called for a subway tunnel for use of railroads, street cars, highway and passenger at an expense of more than $1,000,000.

A number of committees were sent to Washington to prevail on the Government officials to allow a drawbridge to be constructed, but the appeals to the board of engineers of the War Department were unavailing, and this plan was also abandoned.

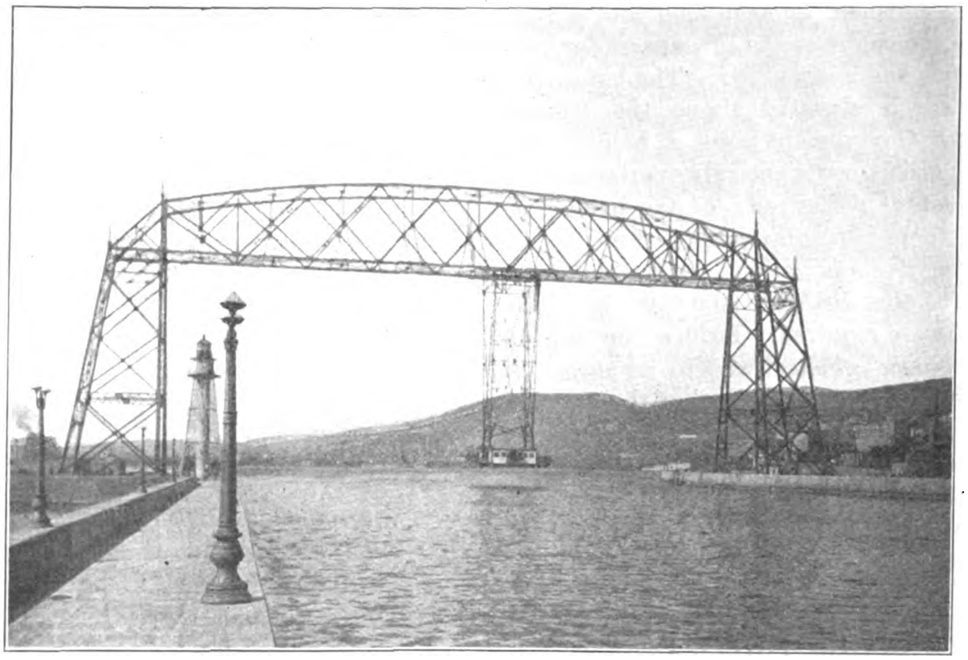
This new electric aerial ferry now in operation at the Duluth Ship Canal is only similar in purpose to the suspended car transfer bridge at Rouen, France. Electric motors are utilized for supplying the necessary power for moving the ferry car, the current being supplied by two separate cable systems from two distinct companies. By means of a switch provided for the purpose and under the control of the bridge operator, if one source of current fails, it is possible for him to turn on the power from the other, and a further safeguard against delays is provided by an adequate hand power which can be employed in case both sources of electric energy fail.

The suspended ferry car has a normal speed of about four miles per hour, but the electrical motors and driving equipment is capable of propelling the car at twice that speed should it become desirble and the passage of the canal can be made by the supended ferry car in slightly over one minute.

There are two electric motors, each of 50 hp. capacity, located under the floors of the car. These electric motors operate two drums, each of which is 9 feet in diameter and on these drums are wound cables 1 inch in diameter extending to the truss and then over idle wheels 9 feet in diameter through the inside of the lower chords to the tower where they are fastened and thus produce the motion which causes the car to travel across the canal,

The canal was adopted by the United States Government about four years ago, increasing its width from 240 to 300 feet, and constructing permanent piers of cribwork and concrete. Minnesota Point was converted into an island by the opening of the canal, and the city accepted the responsibility of providing the inhabitants with adequate communication with the mainland. A rowboat ferry was first maintained, and finally a steam ferry for the transportation of passengers and freight across the canal was substituted.

The imperative necessity of better communication with the Point at a less cost than was being paid for the steam ferry service resulted in the inception of the aerial bridge scheme.



Electric Aerial Ferry on the Duluth Ship Canal.

The idea of the aerial bridge over the Duluth ship canal was received with favor by the United States War Department, and a bond issue by the city of Duluth for the amount of $100,000, the estimated cost of the structure, was sanctioned by the State Legislature and approved by the citizens, and a general specification and contract was prepared and let for the erection of the bridge about four years ago.

Under this original contract the concrete piers for the bridge structure were built, and then the work was abandoned by the company holding the contract. About a year ago the Modern Steel Structural Company of Waukesha, Wis., who has just completed the bridge, entered into a contract for a riveted truss on riveted steel towers as shown in the accompanying illustration, the ferry car to be supported by an inverted truck, as it might be called, and the work was completed according to these plans.

A most ingenious arrangement of the track has been provided to carry the car and hangers. It is inclosed on three sides within the box section of the lower chord and hence there is no danger in the winter of its becoming coated with sleet or snow. Within the chords there are four rails, two in each, with 32 wheels arranged in pairs rolling on the rails and carrying the truck, eight pairs of wheels being employed on each lower chord. The friction of all the working machinery is reduced to a minimum, as the bearings of these wheels, as well as those of the drums and idlers, are of the roller type. On account of the use of roller bearings, the mechanism works very easily and the hand power method of propulsion can be employed without serious difficulty. This is applied by the use of lever handles which are geared to the rim of the drums on the car. It is stated that the cost of operation of this electrically operated aerial ferry bridge will not exceed $7,500 per annum, including the interest on the bonds, which will result in a saving of one-third the cost of the steam ferry boat service previously mentioned.

The four principal piers nearest the canal rest on grillage which is secured on the tops of piling driven 35 feet below the level of the lake, while in the foundations of the bridge there are 730 tons of concrete in the eight piers which extend below the water level of Lake Superior. The towers are held in position by 24 anchor bolts, each of which measures 2 inches in diameter and fastened by large washers to the bottom of the pier. There is a clear height above the ordinary stage of Lake Superior of 135 feet, the height of the bridge being fixed by the Lake Carriers' Association to permit the passage of the highest masts. The total height of the highest part of the bridge above the water is 186 feet, and the depth of the truss at the center is 51 feet, while the width center to center of the trusses is 34 feet, the clear span being 393.75 feet.

It is stated that the car will carry a loaded double truck street car, 350 passengers and two loaded wagons with teams, which is equivalent to about 63 tons, with perfect safety. The car platform measures 50 feet long and 34 feet wide, and contains two inclosed cabins finely finished, 30 feet long and 7 feet wide, in addition to the space for two wagons and a street car. The bottom of the car is elevated above the United States Government piers a height of 6 feet, and it rests entirely overland when at rest at either end of the bridge, so that there is no obstruction or menace in any way to navigation. In the construction of this bridge 1,400,000 pounds of steel were required. Before the last 45 foot piece of steel was to be placed in position, it was found that the opening was 3 inches too narrow. The workmen stood guard with tape lines at a height of 135 feet, while both halves of this massive structure were tilted back, enlarging the opening.

AN AUSTRIAN INDUCTIVE TELEPHONE TRUNK LINE.*

An interesting article by Herr R. Nowotny, which appeared in the Vienna "Zeitschrift fur Elektrotechnik" some time ago, describes a successful experiment made in Austria on the insertion of inductance coils in long telephone lines. The line in question is from Vienna to Innsbruck, a distance of 354 miles, and, being a new one, it was designed from the outset on this system. According to past experience, a 4 mm. (0.1575 in.) bronze wire would have been necessary on the ordinary system, while it was anticipated that 3 mm. (0.1181 in.) would be sufficient diameter for the wire if inductance coils were inserted at intervals; this represented a considerable gain in economy.

For the greater part of the route the existing poles of the telegraph and telephone administration could be utilized for the new line, only 33 miles of new pole route being required. The first 6.4 miles of the line were formed by a pair of wires in an existing paper-insulated underground cable, and there are three other lengths of cable on the route, one 1⅞ miles in length, the second about the same length, and the third 220 yards long. Inductance coils were employed in all the cable sections, with the exception of the 220 yards length, as well as on the overhead line.

The overhead wire itself was erected in accordance with the usual practice of the Austrian telephone administration for interurban work. This implied crossing the two wires of the pair generally at every eighth pole. The wire is of bronze, 3 mm. (0.1181 in.) diameter, except in some Alpine districts in which a compound wire was employed 3 mm. in diameter and with an absolute breaking strength of 1,170 lbs. In some places also it was necessary to employ a lighter wire 2 mm. (0.0787 in.) bronze or compound.

The inductance coils were supplied by Messrs. Siemens & Halske's Vienna branch, who are the owners of Prof. Pupin's Austrian patent. The coils for the overhead line had each a resistance of 1.2 ohms, and an inductance of 0.08 henry, and they were placed at distances of 4 km. (2½ miles) apart on each wire of the loop. To carry the coils it was found possible to employ the pattern of bracket and insulator used by the Austrian telegraph service for branchings with but little alteration. The method of supporting the coil is shown in Fig. 1. The insulators J and J_1 carry the line wire. On J there is a pot-shaped insulator, J_2, in which the inductance coil is embedded in paraffin, while on the second insulator J_1 is fastened an ebonite bell, H, containing the vacuum lighting protector, which is shunted to the inductance coil. It was necessary to erect the line first without the inductance coils, as the latter were not ready for delivery. In order to save soldering the joints when the coils were subsequently inserted, sleeves were employed on the Arld principle. These are short copper sleeves for 2 mm. or 3 mm. wire, which are passed over the ends of the wires at h and h_1, and then twisted round the wire from the middle outwards by means of a special tool. Fig. 2 shows diagrammatically the connection of the inductance coil and lightning arrester. The dotted line represents a short-circuiting wire, which was employed for the tests described later.

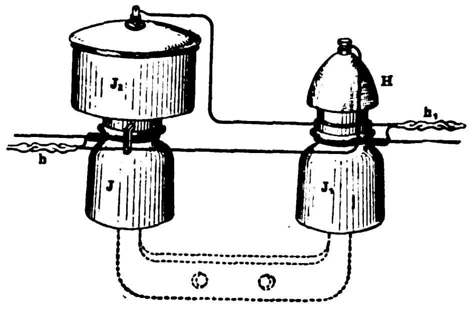


FIG. 1.

The inductance coils on the cable part of the line differed to some extent from those on the overhead line, the two coils on the two wires being wound upon the same iron core in this case, while on the overhead line the coils on the two wires were separate, each being contained in its own insulator pot and each being provided with its own lightning arrester. The resistance of the double coils on the cable was 2.5 ohms and their inductance 0.2 henry. These coils were spaced at distances of 1,250 meters (1,370 yards) apart, and it was so arranged that they were placed at the ordinary joints in the cable, the junction boxes being made sufficiently roomy to take the coils also, and the work of adding the coils to the wires used for the new line did not interfere with the continuous working of the other wires of the cables.

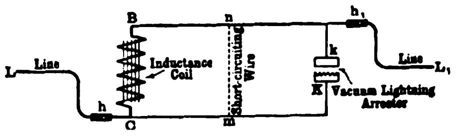

FIG. 2.

In the first instance, speaking tests were made with all the coils on the overhead line short-circuited—the few coils in the underground lines were left in. It was found possible to speak between the Vienna and Innsbruck exchanges with some difficulty and even to speak from an instrument connected directly across the line at Vienna to single-wire subscribers at Innsbruck. It was not found possible in most instances, however, to enable subscribers in Vienna to talk with subscribers in Innsbruck. An experiment was then tried to ascertain the effect of the 10.3 km. (6.4 miles) cable at the Vienna end of the line. This was replaced with a cable of the same length and size not equipped with inductance coils, and there was then a distinct weakening of speech. The same conclusion was come to by using part of the new line between Vienna and Salzburg (330 km.; 188 miles) in connection with the coil-equipped cable and comparing it with another telephone line between the two points. Although one-third of the latter line was of 4 mm. wire and two-thirds of 3 mm. wire, and the new line was of 3 mm. for its whole length, as already stated, the new line gave clearer speaking than the old.

---

* From the "Electrician." London.

The next test was made on the entire length of the new line from Vienna to Innsbruck, but with every second inductance coil short-circuited on the overhead part, so that the coils were only connected in every 8 km. (5 miles). It may be mentioned that speaking tests were also carried out during the process of removing the short-circuiting wires, and it was found that after this work was commenced and the inductances were, therefore, connected irregularly, speaking on the line became much worse, the voice sounding muffled with an absence of sibilants, but as the work of connecting in the coils proceeded, speech improved. Tests then carried out—with the inductance coils at 8 km. (5 miles) intervals showed that loud and clear speech was possible between the two towns, and that subscribers could be connected with very good results. When the mouth was 57 cm. (22½ in) from the microphone at Innsbruck words spoken with ordinary loudness could be heard in Vienna. It was even possible to speak between Innsbruck and Cracow (1,000 km.; 621 miles), although the voices then became very weak, but on extending the line further, to Lemberg—1,350 km. (838 miles) from Innsbruck—speech was no longer possible.

The remaining short-circuiting wires were now removed so that the inductance coils were only spaced at 4 km. (2½-miles) intervals. It was found that the improvement in speech between Innsbruck and Vienna was quite insignificant and the only result was slightly better speech between Innsbruck and Cracow; it was still impossible to talk from Innsbruck to Lemberg. Moreover, when tests were made as before to see what distance the mouth could be removed from the microphone mouthpiece without rendering speech unintelligible, the same result was obtained as with half the inductance coils in use.

A comparison was also made between the new line and a 4-mm. bronze line from Vienna to Trieste, 321 miles long—that is to say, of almost equal length. Speaking was equally good over the two lines in spite of the difference in sectional area. As it will be necessary in practice to interconnect the existing non-inductive lines with sections of the new line, a speaking test was made from Salzburg to Trieste, using the new line from Salzburg to Vienna (188 miles) and the 4-mm. line just mentioned from Vienna on to Trieste. The result was all that could be desired and it was possible to hear well at Trieste when the mouth of the operator at Salzburg was 7⅞ in. from the microphone mouthpiece. Similar tests were made with other lines in conjunction with the new one and the results were satisfactory in every case.

While all these experiments were being carried out an endeavor was made, in conjunction with the representatives of Messrs. Siemens & Halske, to obtain some quantitative results with the aid of high frequency currents. Currents of 8 milliamperes at different frequencies were sent into the line at the Vienna end and the received current was measured at Innsbruck and Salzburg with the aid of a mirror galvanometer. The results of these measurements are shown in Fig. 3. Curves I to VI apply to the whole 354 miles from Vienna to Innsbruck, and curve VII to the part from Vienna to Salzburg only (188 miles). During the tests with the coils all short-circuited, shown in curves I, II and III, the insulation resistance per kilometer of single conductor was 41.5, 25.5 and 18.5 megohms per kilometer respectively. Curve IV gives the results with half the coils only in circuit, and during this test the insulation resistance was 46.5 megohms per kilometer of single line. Curves V and VI, which, it will be seen, are for the line with all the coils in circuit, were taken when the insulation resistance was 12.25 and 9.5 megohms respectively per kilometer of single line; and the part of the line from Vienna to Salzburg had an insulation resistance of 25 megohms per kilometer of single line when curve VII was taken.

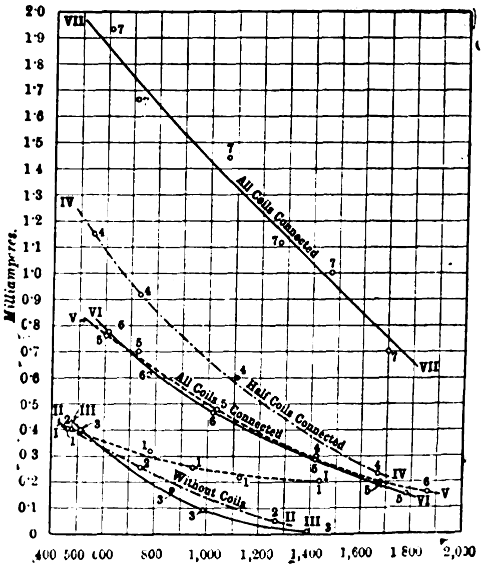

FIG. 3.

The increase of the received current when the coils are in circuit is apparent from these curves, and it is also seen that this is less marked the higher the frequency. This would indicate a considerable weakening of the overtones of the voice, which, however, was not observable in practice. The author ascribes this partly to the impedance of the receiving apparatus, and partly to the fact that larger currents have to be used for the quantitative tests than for actual telephony, while the inductance of the coils is calculated for the telephoning conditions.

The most noticeable feature in the curves, however, is the fact that larger currents were received when only half the coils were in use, this being the more marked the lower the frequency. The paper concludes with a theoretical investigation as to the effect of the insulation upon the working of the line, from which it is concluded that, in damp weather, when the insulation resistance of the line is low, there should be little difference in the effect of coils spaced at 4 km. and coils at 8 km. apart. As in the tests under the former conditions the insulation resistance of the line happened to be lower, the author concludes that the theoretical and practical results are in agreement.

◆

NOTES ON EQUIPMENT FOR ELECTRIC CRANES.

BY W. H. WAKEMAN.

Many foundries and machine shops are equipped with cranes for handling heavy castings and machines and the owners of others are contemplating similar improvements, for they must do it whether they wish to or not, for without proper facilities it is impossible to compete with those who are prepared to work by aid of best modern appliances.

Having laid plans for equipping a foundry with electrical appliances, including a crane, care should be taken to install one large enough to do the work properly. There will be no trouble about lighter castings but how about the heavier pieces which are sure to be wanted sooner or later?

The tendency is to get machinery that soon proves too light for urgent needs, resulting in chagrin, disappointment and loss. Men who have not had experience along these lines seem to think it almost impossible to make a serious error, and yet it is a very easy matter to accomplish.

If the heaviest casting that is made in a certain foundry weighs 15 tons, then it seems necessary to order a crane that will lift it and that will suffice, but that is not enough. Has it ever occurred to you that when your large casting is first lifted from its bed, the heavy cores must be lifted too, also much sand and loam will cling to it, and in addition to this it will require much force to overcome the natural "stick" of the casting to the mould?

All of this extra duty will require about as much strength of construction and power of crane as to lift the finished casting, therefore if the latter weighs 15 tons, calculations should be made for at least 25 tons, and 30 will be better.

Another point bearing on this matter is that in some foundries it is desirable not only to lift the whole mass of molten metal, but the ladle and appliances used with it must be raised at the same time, for even quite large castings are all poured from one heat.

Furthermore, in this age we must look for advancement and not backward movements, therefore provision should be made for heavier work and less hand labor than ever before.

The term "strength of construction" above used refers to foundations for buildings which must also support the heavy steel girders required, also the cranes and their full load. When we consider the shallow foundations, thin walls, and slender roofs that answered every purpose 20 years ago for foundries that did prosperous business, the difference will be apparent. Now everything must be of the most substantial character or it will fail, and such failures usually come when they cause the most damage, by lost time and ruined material.

At the present time no shop where lathes, planers and drill presses are used, can be considered up-to-date unless it is fitted with one or more electric cranes with which to handle the rough castings and finished product. It may be a large repair shop or works where machine tools are made. This makes it necessary to install a generator to supply the current, unless it is more desirable for some special reason to buy it from the local electric light company or a convenient trolley line.

In the latter case it is usually necessary to deal with about 550 volts potential, therefore calculations must be made accordingly. As a general rule, to which there may be a few exceptions, it is better to use a rotary transformer and reduce the potential to 110 volts. Reasons for this are found in the fact that the lower tension is safer for general use and much more convenient for incandescent lighting purposes. Buying current from other parties is not always satisfactory although it may be advisable for a time, but as a rule one man can generate current about as cheap as another in the same locality, therefore it is well to buy a crane motor that is suited to the current that will be used when the crane owner runs his own generator. If he expects to generate current at 550 volts, then buy a crane motor designed for it, and use the trolley pressure for present purposes just as it comes.

My idea in presenting this is to suggest that it be investigated from all points of view, rather than to lay down a cast-iron rule that might not apply to all cases.

In some foundries, and of course in all machine shops, power of some kind is used and it is generally supplied by a steam engine. When an electric crane is contemplated the proprietor expects to install a generator under these conditions and run it just as he would another lathe and get all the current he needs. If the shop was formerly lighted by gas, he considers it a good time to install electric lights instead.

It is surprising to note how many men will lay down plans for such changes without knowing whether they have power enough to do it or not. They seem to think that as it is a steam engine there is practically no limit to the power it will develop if wanted. This is certainly a mistaken idea on general principles, and will cause trouble in every case where the engine already has a full load. Let a test be made by a competent engineer to determine this point.

If there is not a surplus of power available sufficient to drive the generator with a full load it may be advisable to install a separate engine for this purpose. One advantage of this plan is that light can be furnished to finish work in the foundry, after power is no longer wanted, without running the shafting, belts and loose pulleys, also when repairs are to be made to any other part of the plant.

Where the engine already in use is large enough to drive the new generator, it is sometimes considered sufficient to belt it without using a clutch or a loose pulley to stop it when required without shutting down the engine. The owner claims that the generator should always run, in order to provide current so that it may be used without notice.

This is correct in theory but not always practical, because a bearing on the generator may become heated so that it must be shut down for a short time, or it may be desirable to stop it for other reasons, therefore provision should be made for such needs.

Wherever such a crane is to be used in a shop the span should be long enough to cover the entire width of room. In some cases it is made to cover only the central part, but it proves unsatisfactory in practice, because heavy castings and finished machinery must be put on rollers and barred over to the walls, if not wanted for immediate use, making much unsatisfactory labor.

Furthermore, it ought to be made to lift anything made in that shop high enough to back a wagon under it, for this will save much expense in loading and unloading.

When the owner of a shop decides that he must have an electric crane, it is a good idea to investigate the work done along this line by a firm that makes a specialty of this work, and if they can show successful installations in other places they will probably do satisfactory work in your case. Of course it may cost more at first than to patronize somebody who has a nondescript motor to sell, and is sure that he could design a crane although he has never tried it, but it will pay better in the long run.

The speed regulation of the lifting motor on an electric crane should be different from that employed in regular power transmitting equipment, as it should run slowly with a heavy load and speed up in proportion as it is made less. The design should permit of doing this without excessive waste of electrical energy in regulating devices whatever they may be, and the whole should be automatic in operation.

Direct current series wound motors seem to be well adapted to this service as they have increased torque (or turning power) when the speed is reduced by increase of load. For this reason the shaft of such a motor should be larger in diameter than for other motors of the same rated power on other work.

A motor for this service should be wholly inclosed in a cast-iron case to exclude flying dust and dirt, yet facilities for reaching every part of it are necessary.

One bad feature of this system is that bare wires must be used for the trolley, as otherwise current could not be utilized. This is dangerous because other wires may be crossed with them accidentally, or they may come into contact with some of the metal work, resulting in a serious ground or a short circuit, which will cause the shop to be burned to the ground before the fire is subdued.

On this account and for other reasons fuses that are of only slightly greater capacity than are actually required should be used, as they will quickly melt in case of trouble of this kind. Wire of any other kind should never be used in place of fuse wire, yet copper wire is put in where the softer kinds burn out occasionally in order to save trouble in renewing them, but this is exceedingly bad practice and ought to be prohibited in all cases.

When a fuse goes out it will stop the crane as a matter of course, but an efficient brake should always be in use that will hold the load until repairs are made.

ELECTRICITY LEAFLETS.

BY NEWTON HARRISON, E. E.

(*Concluded.*)

INCANDESCENT FILAMENT AND TUBE LAMPS.

The Foundation of High Illumination.—The construction of modern lamps is based upon certain simple principles, derived from an examination of special scientific requirements. These requirements are in themselves derived from the conditions of daily practice, the qualities of materials that are useful in lamp construction, and the limitations imposed by the question of personal risk in the use of a given pressure. Lamps employing a filament are simply cases of where the electrical energy is allowed to act upon a screen or material resisting rapid deterioration under the influence of high temperature. The evolutionary character of the work done to date well illustrates the gradual development of the lamp, to which electricity is applied, into its present tube form. The idea may be represented as follows:

1—The incandescent metal filament in air.

2—The incandescent metal filament in a vacuum.

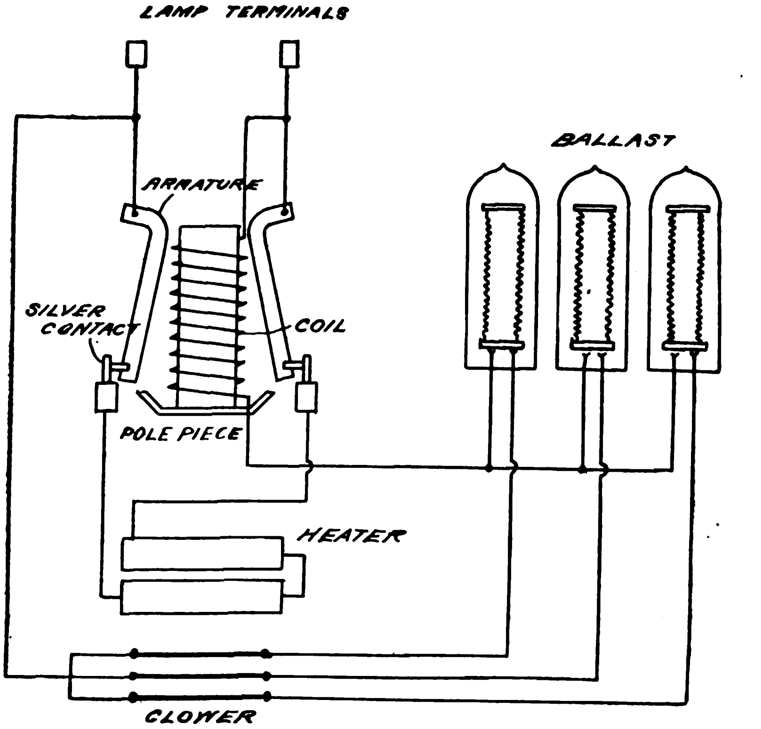
3—The incandescent carbon filament in a vacuum.

4—The incandescent rare oxide filament in air.

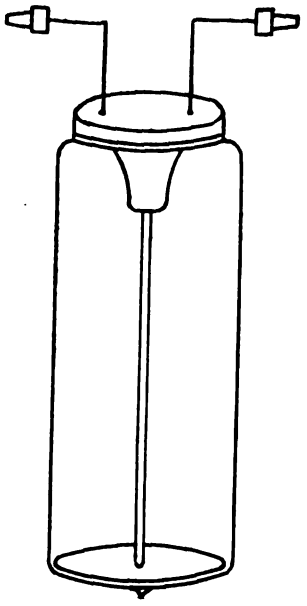
5—The incandescent metal vapor lamp in tube form.

6—The heatless vacuum tube lamp.

In all of these devices, while the ultimate object was the production of light, the ways of attaining this purpose were devious. If the statement is not regarded as too sweeping in character, the fact that all methods of lighting are simply efforts to impress a certain amount of energy upon a light-giving medium or screen will meet every case. From this standpoint, it is evident that the material of which the screen or medium is composed, will have a great influence upon the resulting efficiency. If the screen or medium expresses a condition such that the temperature is limited, then the amount of energy ordinarily absorbed to reach a good light-giving temperature is wasted, in that the resulting temperature does not yield much light. On the other hand, if the medium can stand a very high temperature, then the comparatively large amount of light thrown off, is due to but a slight addition to the energy producing less light. The rare oxide lamp enjoys this reputation, namely, as being a lamp in which a higher temperature yields a much greater amount of light with practically no more energy than that consumed in lower temperature lamps. Dispensing altogether with filaments, and utilizing a gas or vapor, the mercury vapor lamp appears as a logical sequence to previous experiments. It employs a screen of incandescent metallic vapor instead of a solid medium to give light. The so-called vacuum tube lamp is a similar instance of where a screen is employed, composed of comparatively few air particles in a vacuum; the striking and rebound of these, under the influence of electrification, causes incandescence without heat of any importance. Here, it is evident, that the screen upon which the energy operates, is one in which the endeavor is made to avoid the intermediate step in light-making, namely, the temperature.



Automatic Device for Starting the Heater.



Fine Iron Wire Ballast.

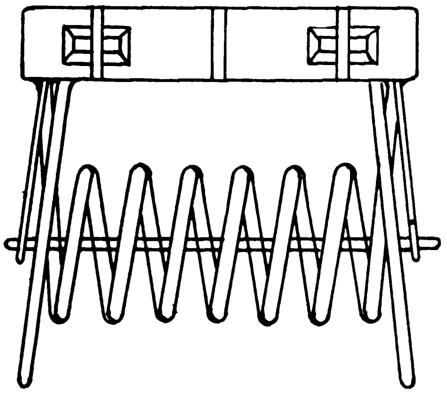
Glower Lamps.—Nernst is credited with the invention of the first practical rare oxide high-temperature lamp. It simply consists of a rod of badly conducting rare oxide material, made up in the form of a paste originally, and then forced through a die to give it its shape. This is called the glower and is supplied with platinum terminals to make contact with the circuit. The rare oxide rod is non-conducting when cold and, in consequence, must be heated before it can conduct current and give light. For this reason it became necessary to contrive a heater for the lamp. The heater is made to work automatically when the light is turned on. Because these physical conditions tend to increase the conductivity of the glower with an increase in temperature, the use of resistance is necessary. Resistances of this kind are of iron, protected from the air in hydrogen-filled bulbs. They are given the name of ballast or ballast resistances. The constituents of the glower lamp when enumerated consist of the following:

1. The rare oxide rod or glower which gives the light at a high temperature.
2. The heater for raising the temperature of the rod when it is to take current.
3. The automatic cut-out for the heater after it has done its work.
4. The iron wire ballast contained in

a tube of gas which regulates the amount of current.

The hydrogen gas employed in the ballast bulb is a more rapid conductor of heat than other gases whose use seems possible.

These lamps are made to fit an incandescent lamp socket and are made up as follows: The smaller lamps are composed of only one glower; the larger lamps consist of six glowers, and may be hung up for illuminative purposes the same as any other large lamp. The ballast resistance is simply connected in series with the glower. The resistance of both the ballast and glower assume a certain value when the lamp is burning. This value limits the current to just the amount necessary to permit it to give its full quota of light. The standard makes of Nernst lamps possess a glower which takes about 220 volts, is 1 inch in length and about $\frac{1}{40}$ of an inch in diameter. The temperature at which the light is given varies from 1,200 degs. F. to 1,400 degs. F., depending upon the current. A fair average is 1,300 degs. F., at which temperature the normal light appears.



A Single Glower and Heating Spiral.

The candle power tests give results as follows: A two-glower, 220-volt lamp gave about 70 cp. with a watt consumption of about 170, or about 2.5 watts per candle power. The light given out during the life of the lamp is very white and agreeable to the eyes when passed through said blasted globes.

The glower lamp needs no vacuum, for the obvious reason that the filament cannot consume in the air. But if inclosed in a vacuum, then the absence of air means a higher temperature and a lower resistance. In consequence, more ballast is required to cut down the current, so the efficiency is not advanced to any remarkable extent by this method. As far as the general power consumption per candle power is concerned, the carbon filament as compared with the filament of Nernst, thought by some to be made of thoria, is about one-half as efficient. The entire gain, as previously stated, is due to a high temperature, by means of which the medium produces more light rays.

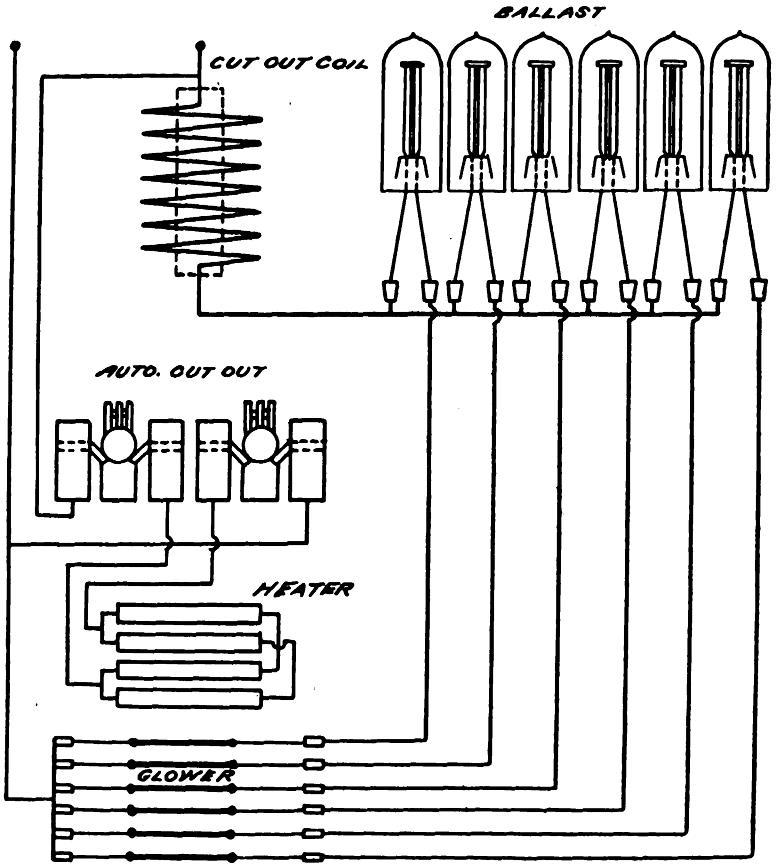


Diagram of Connections of a Six Glower Lamp.

Comparison of Other Light Sources.—The physical effect of light is, of course, that felt by the eye. The principal sources of light, beginning with the sun, which is the most intense light known, are grouped as follows:

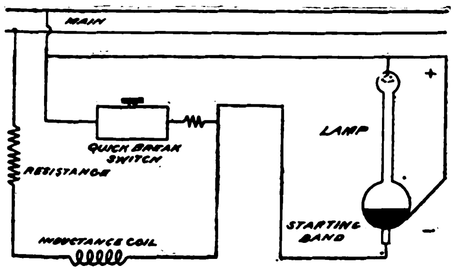
Source of Light.	Approximate Candle Power per Unit Area.	
	Per sq. in.	Per sq. ft.
Sun at noon........	500,000	72,000,000
Arc lamp..........	100,000	14,400,000
Oxyhydrogen light.	5,000	720,000
Nernst lamp.......	1,000	144,000
Incandescent lamp..	300	43,200
Acetylene lamp....	100	14,400
Welsbach lamp....	25	3,600
Gas lamp..........	10	1,400
Kerosene lamp.....	8	1,152
Candle........	4	576

The figures thus given, while not absolutely correct, are still a fair average of the correct candle powers. Experiments conducted with a screen of white material and lamps of the character given produce curious results. The oxyhydrogen light, placed on the screen beside the light from an arc lamp, appears a dull yellow color. In the same manner the acetylene flame sends out a poor kind of light when thus compared. The arc light, when projected on the screen, appears dull in comparison with intense sunlight. The eye is not the most reliable means of comparison, however, because it readily tires and thus fails as a critic. The absorbing qualities of differently colored materials, with regard to light, might be compared with the action of absorbent bodies of various degrees of porosity. White paper, for instance, throws off nearly all the light falling upon it, whereas dark material, such as black paper or black velvet, for instance, absorbs nearly all the light received. The table covering this situation would appear as follows:

Kind of material.	Percentage of light absorbed.	Percentage of light cast off.
White paper......	18	82
Yellow paper.....	40	60
Pink paper.......	64	36
Blue paper........	75	25
Red paper........	88	12
Dark green paper.	88	12
Black paper.......	95	5

The subject of optics and light mixtures occupies an important place in the consideration of commercial light sources. The reason for this is found in the refusal on the part of the public to endure light that is not pleasant to the eyes and senses. In other words, the nervous system is responsive to the effects of certain forms of light, such forms, for instance, where the preponderance of certain light waves over others is productive of unusual color relationships.

The Mercury Vapor Lamp.—In this lamp the red ray is not present when it operates and in consequence the color relationship to which the eye is accustomed is missing. The lamp invented by Cooper Hewitt, bearing the title of the mercury vapor lamp, as its name implies, makes use of the incandescent vapor of mercury for its illumination. A long glass tube is exhausted of air and an electrode attached to one end. This electrode, which may be either iron or mercury, transfers the electrical energy to the other lower electrode at the bottom of the tube composed entirely of mercury. The lamp is thus something like a gigantic thermometer with an upper electrode. The action begins when the circuit is established by means of mercury vapor. In practice this is accomplished by means of a high tension spark, which jumps between the electrodes. To obtain this spark it is necessary to provide a powerful inductance coil, by means of which a quick break sends the spark across.



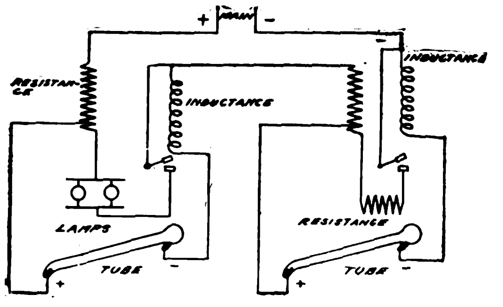
Connections with the Quick-Break Method.

Another way of starting the tube is to tilt it until the mercury forms a stream from electrode to electrode and then permit it to resume its original position. Sufficient incandescent vapor will form to bridge the two electrodes and form the light-giving screen required. The use of direct current has imposed some limitations upon its general application, but that does not otherwise interfere with its increasing field of serviceability. The tube data may be stated as follows:

1. Length of the tube—43 inches for 100 volts, 49 inches for 120 volts.
2. Total length—50 inches for 100 volts, 56 inches for 120 volts.
3. Diameter—1 inch.
4. Current from 3 to 3.5 amperes.
5. Candle power between 650 and 750.
6. Life about 1,600 hours.

Method of Starting and Connecting Up.—The practical facts in connection with this new source of illumination necessarily relate to its installation and connection to the electric light mains.

In the sketches the following conditions are imposed: First, the lamp is started by the inductive device for throwing a spark from electrode to electrode; second, the two lower voltage lamps are set into operation by tipping and are shown in series on a 110 volt circuit.



Two Tubes in Series on a 110-volt Circuit.

The use of the quick break switch, in conjunction with the self-induction coil, is illustrated readily in practice by starting an arc between two carbon rods by means of the electromagnetic discharge of a coil across terminals composed of such carbon rods.

Here with the mercury lamp the high resistance path is bridged readily by means of mercurial vapor and it is then a simple matter to understand the continuation of the phenomenon. The entire principle is that of continuing an arc of mercury between two terminals in a vacuum. The starting circuit is not in use after the arc starts within the tube.

Efficiency of Tube.—The amount of candle power produced equals 750 and the power consumed equals about 400 watts.

On this basis the watt consumption per candle power equals 750 ÷ 400 = 1.875 cp. per watt or conversely, a little more than $\frac{1}{2}$ a watt per candle power. The incandescent lamp does not show figures as high as this, neither does the Nernst lamp. The presence of red rays would mean the universal application of this device wherever electric lighting is done. Their absence limits its use to docks, large lofts, factories and places where the color problem plays no part of importance. The suggestion once advanced that the tube be made of red glass to supply the missing rays, would mean darkness instead of light. As there are no red rays in the light, and as none but red rays can pass through red glass, it is obvious that no light would penetrate the walls of the tube. The only remedy is to provide a means of developing red rays in the tube itself by the introduction of another element or a modification of the method.

Vacuum Tube Lighting.—Exhausted tubes supplied with electrodes, and a high tension alternating current developing light within them, represent the elements of this system. The current is unique, inthat it is developed into a wave with a peculiar form of curve. In this method of light-making, a certain abrupt influence is necessary in the transformer to develop the correct inductance and consequent discharge through the tube. The peaked nature of the wave, passing in and out of the step-up transformer, is thus a characteristic of the system. The energy passes through many feet of tube in producing light. As far as scientific ideals are concerned this method comes first, but it has not as yet touched that high apex of efficiency necessary to give it prominence or popularity.

THE BRITISH ASSOCIATION.

Prof. Darwin on Radium and the Constitution of Matter.

The presidential address of Prof. G. H. Darwin, F.R.S., to the British Association for the Advancement of Science being divided into two parts—the second of which was not due to be delivered at Johannesburg until August 30—we are only able to refer to the first half which was delivered at Cape Town on August 15. Evolution was the theme, and radium, atomic theory and the constitution of matter occupied considerable attention. We quote the following extracts:

The fascinating idea that matter of all kinds has a common substratum is of remote antiquity. In the Middle Ages the alchemists, inspired by this idea, conceived the possibility of transforming the baser metals into gold. The sole difficulty seemed to them the discovery of an appropriate series of chemical operations. We now know that they were always indefinitely far from the goal of their search, yet we must accord to them the honor of having been the pioneers of modern chemistry. The object of alchemy as stated in modern language was to break up or dissociate the atoms of one chemical element into its component parts, and afterwards to reunite them into atoms of gold. Although even the dissociative stage of the alchemistic problem still lies far beyond the power of the chemist, yet modern researches seem to furnish a sufficiently clear idea of the structure of atoms to enable us to see what would have to be done to effect a transformation of elements. Indeed, in the complex changes which are found to occur spontaneously in uranium, radium, and the allied metals we are probably watching a spontaneous dissociation and transmutation of elements. Natural selection may seem, at first sight, as remote as the poles asunder from the ideas of the alchemist, yet dissociation and transmutation depend upon instability and regained stability of the atom, and the survival of the stable atom depends on the principle of natural selection. Until some 10 years ago the essential diversity of the chemical elements was accepted by the chemist as an ultimate fact, and, indeed, the very name of atom, or that which cannot be cut, was given to what was supposed to be the final indivisible portion of matter. The chemist thus proceeded in much the same way as the biologist who, in discussing evolution, accepts the species as his working unit. Accordingly, until recently the chemist discussed working models of matter of atomic structure, and the vast edifice of modern chemistry has been built with atomic bricks.

But within the last few years the electrical researches of Lenard, Roentgen, Becquerel, the Curies, of my colleagues Larmor and Thomson, and a host of others, have shown that the atom is not indivisible, and a flood of light has been thrown thereby on the ultimate constitution of matter. Amongst all these fertile investigators it seems to me that Thomson stands pre-eminent, because it is principally through him that we are to-day in a better position for picturing the structure of an atom than was ever the case before. Even if I had the knowledge requisite for a complete exposition of these investigations, the limits of time would compel me to confine myself to those parts of the subject which bear on the constitution and origin of the elements. It has been shown, then, that the atom, previously supposed to be indivisible, really consists of a large number of component parts. By various convergent lines of experiment it has been proved that the simplest of all atoms—namely, that of hydrogen—consists of about 800 separate parts, while the number of parts in the atom of the denser metals must be counted by tens of thousands. These separate parts of the atom have been called corpuscles or electrons, and may be described as particles of negative electricity. It is paradoxical, yet true, that the physicist knows more about these ultra-atomic corpuscles and can more easily count them than is the case with the atoms of which they form the parts. The corpuscles, being negatively electrified, repel one another just as the hairs on a person's head mutually repel one another when combed with a vulcanite comb. The mechanism is as yet obscure whereby the mutual repulsion of the negative corpuscles is restrained from breaking up the atom, but a positive electrical charge or something equivalent thereto, must exist in the atom so as to prevent disruption. The existence in the atom of this community of negative corpuscles is certain, and we know further that they are moving with speeds which may in some cases be comparable to the velocity of light, namely, 200,000 miles a second. But the mechanism whereby they are held together in a group is hypothetical.

It is only just a year ago that Thomson suggested, as representing the atom, a mechanical or electrical model whose properties could be accurately examined by mathematical methods. He would be the first to admit that his model is at most merely a crude representation of actuality, yet he has been able to show that such an atom must possess mechanical and electrical properties which stimulate, with what Whetham describes as "almost Satanic exactness," some of the most obscure and yet most fundamental properties of the chemical elements. "Se non e vero, e ben trovato," and we are surely justified in believing that we have the clue which the alchemists sought in vain. Thomson's atom consists of a globe charged with positive electricity, inside which there are some thousands of corpuscles of negative electricity, revolving in regular orbits with great velocities. Since two electrical charges repel one another if they are of the same kind, and attract one another if they are of opposite kinds, the corpuscles mutually repel one another; but all are attracted by the globe containing them. The forces called into play by these electrical interactions are clearly very complicated, and you will not be surprised to learn that Thomson found himself compelled to limit his detailed examination of the model atom to one containing about 70 corpuscles. It is indeed a triumph of mathematical power to have determined the mechanical conditions of such a miniature planetary system as I have described.

It appears that there are definite arrangements of the orbits in which the corpuscles must revolve if they are to be persistent or stable in their motions. For the purpose of general discussion, which is all that I shall attempt, you may take it that the number of corpuscles in such a community is fixed; and we may state that definite numbers of corpuscles are capable of association in stable communities of definite types. An infinite number of communities are possible, possessing greater or lesser degrees of stability. Thus the corpuscles in one such community might make thousands of revolutions in their orbits before instability declared itself; such an atom might perhaps last for a long time as estimated in millionths of seconds, but it must finally break up, and the corpuscles must disperse or rearrange themselves after the ejection of some of their number. We are thus led to conjecture that the several chemical elements represent those different kinds of communities of corpuscles which have proved by their stability to be successful in the struggle for life. If this is so, it is almost impossible to believe that the successful species have existed for all time, and we must hold that they originated under conditions about which I must forbear to follow Sir Norman Lockyer in speculating. But if the elements were not eternal in the past, we must ask whether there is reason to believe that they will be eternal in the future. Now, although the conception of the decay of an element and its spontaneous transmutation into another element would have seemed absolutely repugnant to the chemist until recently, yet analogy with other moving systems seems to suggest that the elements are not eternal.

At any rate it is of interest to pursue to its end the history of the model atom which has proved to be so successful in imitating the properties of matter. The laws which govern electricity in motion indicate that such an atom must be radiating or losing energy, and therefore a time must come when it will run down as a clock does. When this time comes it will spontaneously transmute itself into an element which needs less energy than was required in the former state. Thomson conceives that an atom might be constructed after his model so that its decay should be very slow. It might, he thinks, be made to run for a million years, but it would not be eternal. Such a conclusion is an absolute contradiction to all that was known of the elements until recently, for no symptoms of decay are perceived and the elements existing in the solar system must already have lasted for millions of years. Nevertheless, there is good reason to believe that in radium, and in other elements possessing very complex atoms, we do actually observe that break-up and spontaneous rearrangement which constitute a transmutation of elements. It is impossible as yet to say how science will solve this difficulty, but future discovery in this field must surely prove deeply interesting. It may well be that the train of thought which I have sketched will ultimately profoundly affect the material side of human life, however remote it may now seem from our experiences of daily life.

I have not as yet made any attempt to

represent the excessive minuteness of the corpuscles, of whose existence we are now so confident, but, as an introduction to what I have to speak of next, it is necessary to do so. To obtain any adequate conception of their size we must betake ourself to a scheme of threefold magnification. Lord Kelvin has shown that if a drop of water were magnified to the size of the earth the molecules of water would be of a size intermediate between that of a cricket ball and of a marble. Now, each molecule contains three atoms, two being of hydrogen and one of oxygen. The molecular system probably presents some sort of analogy with that of a triple star; the three atoms, replacing the stars, revolving about one another in some sort of dance which cannot be exactly described. I doubt whether it is possible to say how large a part of the space occupied by the whole molecule is occupied by the atoms, but perhaps the atoms bear to the molecule some such relationship as the molecule to the drop of water referred to. Finally, the corpuscles may stand to the atom in a similar scale of magnitude. Accordingly a threefold magnification would be needed to bring these ultimate parts of the atom within the range of our ordinary scales of measurement. I have already considered what would be observed under the triply powerful microscope, and must now return to the intermediate stage of magnification in which we consider those communities of atoms which form molecules. This is the field of research of the chemist.

Although prudence would tell me that it would be wiser not to speak of a subject of which I know so little, yet I cannot refrain from saying a few words. The community of atoms in water has been compared with a triple star, but there are others known to the chemist in which the atoms are to be counted by fifties and hundreds, so that they resemble constellations. I conceive that here again we meet with conditions similar to those which we have supposed to exist in the atom. Communities of atoms are called chemical combinations, and we know that they possess every degree of stability. The existence of some is so precarious that the chemist in his laboratory can barely retain them for a moment: others are so stubborn that he can barely break them up. In this case dissociation and reunion into new forms of communities are in incessant and spontaneous progress throughout the world. The more persistent or more stable combinations succeed in their struggle for life, and are found in vast quantities, as in the cases of common salt and of the combinations of silicon. But no one has ever found a mine of gun-cotton, because it has so slight a power of resistance. If, through some accidental collocation of elements, a single molecule of gun-cotton were formed, it would have but a short life. Stabilitity is, further, a property of relationship to surrounding conditions; it denotes adaptation to environment. Thus salt is adapted to the struggle for existence on the earth, but it cannot withstand the severer conditions which exist in the sun.

The second part of the address will be devoted to a consideration of various theories of evolution in the heavens.

WRINKLES.*

EDITED BY H. C. ABELL.

Making a Pump Lift Hot Water.

Hot water, even up to 180 degs. F., may be lifted about 10 or 11 feet if the following piping is run: At the point where the vertical riser from the well meets the horizontal suction pipe to the pump an elbow would ordinarily be used; instead of the elbow use a tee, on the run of the tee extend the vertical pipe for about four feet and cap it over. This will do the trick.

H. C. HALL, Fall River, Mass.

An Indicator Device.

Where considerable work is done in indicating engines in isolated plants, etc., a guide, partly for the indicator card, made as follows, will be found useful:

A clamp to fit the indicator piping is mounted on the end of a piece of half-inch pipe 24 inches long; a small pulley is mounted on a block that slides on the pipe and is fastened with a set screw. This can be quickly fastened to the indicator piping, which is necessarily on the cylinder, and for any position of the reducing motion the card can be adjusted so that it is in line with the cylinder.

J. F. DOSTAL, Denver, Col.

Old-Time Telegraphers Meet.

The Old-Time Telegraphers' and Historical Association and the Society of the United States Military Telegraph Corps are holding their annual conventions in New York City together this week. The exercises commenced yesterday and will continue until Friday.

The programme to-day includes a trip to Coney Island, while on Thursday the banquet will take place at the Waldorf-Astoria, when, it is expected, that at least 500 to 700 will participate. Friday will be devoted to automobile rides and then the convention will adjourn.

ELECTRICAL PATENT RECORD.

LETTERS PATENT ISSUED AUGUST 22, 1905.

Electric Railways and Appliances.

797,589. Electric Car or Locomotive. Nils D. Levin, Chicago, Ill., assignor to the Goodman Manufacturing Company, same place. Filed April 22, 1904. Renewed April 6, 1905.

797,591. Electrical Railway Signaling System. Leonidas N. Lyon, Jr., Flatonia, Tex. Filed Nov. 29, 1904.

797,669. Trolley-Wire-Repair Service. Hermann Dems, Chicago, Ill. Filed Nov. 11, 1904.

797,678. Electric Railway-Signal. Jake Friedlander, Fargo, N. D. Filed Dec. 27, 1904.

797,720. Trolley. Henry B. Clarke, Chicago, Ill. Filed Feb. 26, 1904.

797,859-860. Train-Control System. Charles E. Lord, Cincinnati, O., assignor to the General Electric Company. Filed Jan. 27, 1905.

Electric Lights and Appliances.

797,593. Incandescent Electric Lamp. Albert W. W. Miller, South Orange, N. J. Filed Sept. 3, 1903.

797,629. Electric-Arc Lamp. Bernard A. Stowe, Cleveland, O., assignor to the Jandus Electric Company. Filed May 25, 1904.

797,690. Incandescent-Lamp Socket. Norman Marshall, Newton, Mass. Filed Jan. 21, 1904.

797,806. Arc-Lamp Hanger and Cut-Out. Charles E. Harthan, Lynn, Mass., assignor to the General Electric Company. Filed April 29, 1903.

797,825. Electric-Lamp Socket. Albert P. Seymour, Syracuse, N. Y., assignor to Pass & Seymour, Solvay, N. Y. Filed April 27, 1904.

Electrical Machinery and Apparatus.

797,679. Circuit-Closer, Jake Friedlander, Fargo, N. D. Filed March 20, 1905.

797,774. System of Motor-Control. Charles E. Lord, Cincinnati, O., asssignor to the General Electric Company. Filed April 12, 1905.

797,868. Transformer. Edwin W. Rice, Jr., Schenectady, N. Y., assignor to the General Electric Company. Filed April 4, 1904.

797,889. Controlling Electric Motors. William Geipel and Frederick M. T. Lange, London, and George W. Mascord, Barnes, Eng. Filed Nov. 28, 1904.,

797,917. Electrical Meter. Henry W. Sayles, Peoria, Ill., assignor to the Diamond Meter Company, same place. Filed March 13, 1905.

797,993. Automatic Regulator for Electric Circuits. Montgomery Waddell, New York City. Filed June 28, 1904.

798,038-039. Apparatus for Electrical Regulation. Albert S. Hubbard, Greenwich, Conn. Filed June 17, 1904, and Feb. 25, 1905.

798,052. Steering Mechanism for Motor-Vehicles. Herbert W. Alden, Hartford, Conn., assignor to the Electric Vehicle Company. Original application filed June 16, 1902. Divided and this application filed June 19, 1905.

Telephones and Telephone Apparatus

797,561. Telephone Hook-Switch. Josephus M. Clement, Mineralbluff, Ga. Filed March 8, 1905.

797,586. Telephone System. Edmund Land, Grand Rapids, Mich. Filed Nov. 2, 1904.

798,035. Telephone System. Calvin R. Green and David R. Green, Risingsun, Ind. Filed Dec. 20, 1904.

798,043. Automatic Listening Apparatus for Telephone Operators' Cord-Circuits. Jacob W. Lattig, Wyncote and Charles L. Goodrum, Philadelphia, Pa., assignors to the Eastern Telephone Manufacturing Company, West Chester, Pa. Filed June 6, 1903.

Miscellaneous.

797,570 Multiplex-Telegraph System. Tullio Giara, Boston, Mass. Filed July 5, 1904.

797,628. Electromagnetic Compensating Device. Bernard A. Stowe, Cleveland, O., assignor to the Jandus Electric Company. Filed May 24, 1904.

797,718. Portable X-Ray Apparatus. Eugene W. Caldwell, New York City. Filed Aug. 18, 1904.

797,747. Electric Furnace. Henry N. Potter, New Rochelle, N. Y., assignor to George Westinghouse, Pittsburg. Pa.. Filed July 23, 1903.

797,811. Watch Demagnetizer. Patrick Kerns, Chicago, Ill. Filed March 7, 1903.

797,863. Syntonic Signaling System. Maurice Milch, Schenectady, N. Y., assignor to the General Electric Company. Filed March 30, 1904.

---

*Paper presented before the National Electric Light Association at its 28th convention, held at Denver-Colorado Springs. Col., June 6-11 1905.

THE TELEPHONE WORLD.

Telephone Company Wins.

An option by Judge C. D. Clark, in the suit styled the East Tennessee Telephone Company vs. the Mayor and Aldermen of the City of Knoxville, has been made public, and every claim made by the plaintiff is sustained.

Some time ago the board of public works of Knoxville interfered with the telephone company in its erection of poles and other work necessary for the operation of an exchange in that city. The corporation asked an injunction to prevent the city from interfering with its work.

City Attorney Culton filed a demurrer in which he alleged that the corporation had no franchise in that city because of a technicality. Briefs were filed and after due consideration Judge Clark forwarded his decision to Knoxville, in which the injunction is granted. He holds that the corporation holds a good and valid franchise, and even if such were not true, the city, by granting privileges to the company in the past and regarding it as a lawful corporation, has estopped itself from interference.

Oakland, Cal., has a new Independent automatic telephone system in operation, at least a considerable portion of the work of installing such a plant has already been done. About two years ago W. A. Beasley obtained a franchise for the establishment of an Independent telephone system in Oakland. This franchise was subsequently transferred to the Oakland Home Telephone Company, which was organized for the purpose of building the system. The company's plans are to install the automatic system over the whole of Oakland. All of the work will be of first-class character and it is intended the subscribers will all be furnished with telephones as fast as the machinery arrives from the East.

The Rogers Telephone & Electric Company of Danbury, Conn., with a capital stock of $20,000, divided into 200 shares of $100 each and with the whole amount paid in, has been incorporated by Arthur J. Baldwin, of New Jersey; N. Burton Rogers, George L. Eastman, C. B. Bogers and Annie R. Davenport, of Danbury, and Frank E. Wiske, of New York.

The new switchboard and the other improvements to the plant of the Independent Telephone Company of Syracuse, N. Y., will be in operation by January 1,

Theodore Gary, the Macon, Mo., capitalist, who recently purchased the Home telephone system in Independence, expects to start improvements in the newly acquired plant.

News from Philadelphia, Pa., states that under the terms of the Keystone Telephone mortgage the company's conduits cannot be sold, but they may be leased.

There are said to be nearly 50 different rural telephone lines in Crawford County, Kan., owned by farmers.

The Independent Telephone Company of Athens, Ill., has put a telephone in the city hall for the use of the city officials.

Two Telephone Companies Seek Franchises.

Applications for franchises from two Independent telephone corporations, whose financial standing is said to be good, are now pending before the Brooklyn, N. Y., board of estimate, and a public hearing will be held on one of them on September 15. The public hearing on the other application has already been held, and the experts in the finance department are busy determining the terms and compensation.

The latest franchise application on which the public hearing will be held next month is from the Star Telephone Company, a domestic corporation organized under the laws of this State. The city is asked to give the company a franchise to lay, erect, construct and maintain suitable wires or conductors, over and under the streets and highways of the entire five boroughs. This privilege is asked for a period of 25 years, with the right of renewal for another 25 years. At the end of this period the franchise and all the property, except the plant of the company, shall revert to the city without further compensation. It is stipulated that the city shall pay a fair valuation for the plant.

Here are the conditions under which the company proposes to operate :

"Five cents a call where there is no guarantee by the subscriber to pay a fixed sum per annum.

"Sixty dollars per annum for unlimited service when the instrument is located in a private residence.

"One hundred dollars per annum for unlimited service where the telephone instrument is located in a place of business."

In payment for the franchise the company agrees to furnish and install in the various municipal offices for the free use of the city telephones to a number not to exceed 600. It also agrees to pay to the city each year a sum equal to 5 per cent. of the gross receipts of the company. Work to install the system on the granting of the franchise is to begin immediately. The application is signed by Richard S. White as president.

After the public hearing, which is a charter formality to give any person interested an opportunity to be heard, the application will be referred to the bureau of franchises in the finance department, to arrange the terms and compensation.

The Bureau at present is preparing the terms and compensation of a franchise which will be granted to the Atlantic Telephone Company some time in the fall. The rates for which this company is ready to give the city a public telephone service are; it is said, just as advantageous as those offered by the Star Telephone Company.

The Northwestern Telephone Company of Minneapolis, Minn., is about to put in a private exchange in the court house, following in the footsteps of the Twin City Company, which has long maintained a court house central. The location has not yet been decided upon, but plans for the exchange are being drawn up.

The North Cape Telephone Company has extended another line to Ives Grove, Wis.

Final survey on the extension of the Southwestern Telephone Company from Corpus Christi to Rockport, Tex., was lately completed. Workmen have staked a line from the former place to San Diego, in Duval County. This will give Corpus Christi two circuits along the line of the Texas-Mexican Railroad. All these improvements are under the supervision of Engineer W. C. Prickett. Plans and specifications are now being considered for changing the Corpus Christi exchange to a central energy system. Within the past year the number of subscribers in that city has almost doubled, owing to Manager Truitt and improved business conditions. There remain many orders ahead for new 'phones, which will be supplied as soon as possible.

A meeting was recently held at the court house in Logan, Ia., by those interested in reducing local telephone rates and the formation of a new Independent mutual company. About 200 were in attendance. The communication from the Woodbine Telephone Company was read and a number of speeches were made. A committee, composed of B. A. Keller, John A. Berry, S. N. Dale, J. M. Kennedy and W. E. Elbert, was chosen to go to Woodbine in regard to the matter.

The Home Telephone Company of Bowling Green, Ky., has just completed the task of putting in about two miles of cable in that city. It has also made a number of extensions in different parts of the city and county and greatly increased the capacity of the plant. This company is daily adding to its already fine service and the people of the city are greatly pleased with the effort being put forth by the management to give the people a first-class telephone system,

The Oceanside, Cal., Home Telephone & Telegraph Company has filed a petition with the city for a 50-year franchise, work on the lines to begin at once and lines to be put in working order within 18 months. Sixty days will see the lines through Oceanside to San Diego. The city council will without doubt grant the desired franchise.

Officers have been elected by the Citizens' Standard Telephone Company of Kingston, N. Y., as follows: Mortimer C. Drake, president; Thomas M. Brush, vice-president; Charles Reynolds, secretary and treasurer.

The Browerville, Minn., Telephone Company has filed articles of incorporation with the Secretary of State. The capital stock is $10,000.

Telephone Incorporations.

The Adjustaphone Company, Camden, N. J. —to manufacture telephones, switchboards, transmitters and machinery. Capital stock, $250,000. Incorporators: Robert Hill, William S. Pearne, and Frank D. Pearne.

The Effingham County Telephone Company, Altamont, Ill. Capital stock, $6,000. Incorporators: C. E. Munday, A. B. Munday and G. F. Taylor.

GENERAL ELECTRICAL NEWS.

LIGHTING.

Benwood, W. Va.—The Ohio Valley Electric Light & Power Company has been organized with W. C. Handlan, president.

Camden, Pa.—The object of the Wyoming Gas & Electric Company is to operate and maintain gas and electric lighting plants. Its capital stock is $15,000. John A. MacPeak and others are interested.

Chicago, Ill.—The Austin Electric Light Company of this city has been incorporated with a capital stock of $10,000, for the purpose of furnishing light, heat and power. The incorporators are Charles R. Whitman, George E. Dawson and others.

Clinton, O.—The Clinton Electrical Light & Power Company has been incorporated with a capital of $10,000, by William L. Morey and J. W Robb.

Columbia, Mo.—In a recent special election the citizens voted to issue $10,000 worth of bonds for the extension of the sewer system. A $10,000 issue was also authorized for the construction of improvements to the water and electric light plant, which has been owned by the city for two years. This issue is in addition to a $100,000 issue at the time the plant was bought.

Cooperstown, N. D.—An electric light franchise is to be granted here.

Concord, N. C.—This city is soon to have practically a new electric light plant. Contracts for the necessary materials have already been let and bids for the machinery will soon be asked for.

Dana, Ind.—The citizens have decided by popular vote to erect an electric light plant.

Enosburg Falls, Vt.—F. W. Sayles, of Boston, is preparing plans for an electric light plant which is to be built by the D. B. J. Kendall Company.

Fairmont, Minn.—The citizens will vote on the question of issuing $18,000 in bonds to enlarge, extend and improve the electric light plant.

Gainesville, Fla.—This city will order an election to vote on issuing bonds for $50,000 to construct a sewerage system; $50,000 for buying the present electric plant, or building a new one, and $10,000 for street improvements. Address the mayor.

Geneva, Ind.—W. R. Thurston, of Bern, who was instrumental in installing the electric light plant at that place, has asked the town board here to grant him a franchise permitting him to build an electric light plant.

Glasford, Ill.—This city is to have an electric light plant.

Latrobe, Pa.—The Latrobe Electric Light Company has purchased the plant of the Derry Electric Light Company. It is stated that the intention is to supply the current for the Westmoreland County Street Railway. Latrobe, Derry, Bradenville, Loyalhanna and other intermediate points, will be furnished with electric light from the plant here.

Mattapoisett, Mass.—Present indications point to a successful consummation of plans that have been underway for the past two years to furnish this place with electric lights for the general use of the residents. An examination made by the New Bedford Gas & Edison Light Company two years ago demonstrated that the plan was a feasible one, if a sufficient number of the residents of the town would agree to use electricity. It is believed now that the agitation has reached a point where it will be carried out.

Pekin, Ill.—The Tremont electric light and power plant will be rebuilt.

Pentwater, Mich.—The Pere Marquette Power & Light Company here has been granted a 10-year contract for furnishing the village of Hart with power and light. The company will build a power house on Ruby Creek, and furnish light and power to this place, Hart and Shelby.

San Francisco, Cal.—It is stated upon the highest authority that the actual transfer of the San Francisco Gas & Electric Company to the Rockefeller interests has taken place.

Sumner, Ia.—Ground has been broken for the erection of the electric light plant.

Toledo, O.—The Toledo Gas, Electric & Heating Company, the concern that recently merged the heating and lighting companies of this city, has decided on the location for a new lighting plant. Willard F. Robinson is president of the new company.

STREET RAILWAYS.

Albany, N. Y.—The Genesee River Railroad Company of New York was lately incorporated to build and operate a steam or electric road 34 miles long from Portage to Cuba. The capital is $250,000 and the directors are Frederick B. Underwood, George F. Brownell, Francis L. Stetson, Granville A. Richardson, Charles Steele, Joseph M. Graham, M. P. Blauvelt and J. C. Stuart, of New York, and Herbert A. Taylor, of Upper Montclair, N. J.

Angola, Ind.—An election will shortly be held to vote $35,000 for the St. Joe Valley Traction Company.

Bessemer, Ala.—There is considerable talk in Jonesboro with reference to an electric car line, it being understood that the Birmingham Railway, Light & Power Company is making a move to extend its lines from Jonesboro to this city.

Boonville, Ind.—A franchise has been granted to the Evansville & Newburg Traction Company into this city to the public square.

Defiance, O.—A movement is on foot for the construction of an electric line between this city and Detroit.

Flushing, N. Y.—A. T. Stewart's old railroad line, running from here to Garden City, is to be rebuilt by the Long Island Railroad Company and made part of its electrical system.

Hutchinson, Kan.—Howard S. Lewis has completed a deal whereby he acquired the L. A. Bigger interests in the Hutchinson Street Railway Company. The purchase was made for a syndicate, of which Mr. Lewis is the head, and which has for its object the transforming of the system into an electric railway system. The organization of the company and the securing of all necessary concessions will be carried out at once.

Lake George, N. Y.—The Ticonderoga Union Terminal Railroad Company has been incorporated to operate an extensive line of railways in the Eastern Adirondacks. The contract for construction between Addison Junction, the termini of the Rutland division and New York Central and the Delaware & Hudson Company to this place, it is expected will soon be let to a construction company and that work will begin inside of 60 days.

Maysville, Ky.—The Maysville-Flemingsburg Motor Traction Company, with $12,000 capital stock, has been incorporated.

Monee, Ill.—The Chicago & Southern Traction Company has a force of men at work surveying for the electric line from Chicago Heights to this place, and from here to Kankakee.

Orange, N. J.—Workmen have started to change the grade and gauge of the old Orange Mountain Traction Company's cable road, which scales the Orange Mountain in West Orange. It is now proposed to run a trolley line over the old roadbed. The road will open a large tract of valuable and at present undeveloped country.

Paxton, Ill.—The McKinley Syndicate will build an electric line from Danville to Newman.

Piercetown, S. C.—A meeting was held here recently for the purpose of discussing plans for building the proposed trolley line between Easley and Anderson.

Pontiac, Ill.—The stockholders of the Bloomington & Pontiac Electric Railway, at a meeting held here, authorized an increase in the capital stock from $300,000 to $2,500,000. Work on extending and equipping the road from this city to Bloomington and from Dwight to Joliet will be commenced at an early day.

Pottsville, Pa.—The Pottsville Union Traction Company has issued orders for the construction at once of a trolley line between Frackville and St. Clair. It will be six miles in length and connect with the 40 miles of trolley system in and abont the county seat.

Wooster, O.—The entire issue of $800,000 of bonds for constructing the Wooster & Mansfield Electric Railway have been sold.

POWER PLANTS.

Galion, O.—The council has at last granted a franchise to the Crawford County Gas & Electric Company. The company will construct a plant here and furnish electric power throughout the county.

Pittsfield, Mass.—Plans are under way for the erection of a big electrical power plant on the Deerfield River, a few miles north of the eastern portal of the Hoosac Tunnel, to generate 4,000 hp. A charter for the new company has been secured from the State of Vermont, under the name of the Deerfield River Power Plant Company. Among those interested in the project are W. S. Morton, of Hartford, Conn.; James H. Roraback, of Canaan, Conn., and Faxon Bowen, of Readsboro, Vt. The plant will be located near Readsboro, just across the Massachusetts State line, and a few miles north of Hoosac Tunnel station at the eastern portal.

Rhinelander, Wis.—A. E. Edmonds and others of this place, will erect a power plant near Florence, and will also build an interurban line.

NOTES FOR INVESTORS.

Latest quotations for copper are: Electrolytic, 16⅜@16⅝c.; Lake 16⅜@16⅝c.; casting, 16@16¼c.

The annual meeting of the Philadelphia Union Traction Company will be held September 20.

Chicago City Railway stock was sold on Saturday for the first time in several months, the price being 190.

The Edison Electric Illuminating Company of Boston has filed a statement giving $29,000,000 as its valuation.

The Bell Telephone Company of Philadelphia claims that it will earn nearly 10 per cent. this year on its capital stock.

Electric Company of America stock was heavy in Philadelphia on Monday on rumored competition with its Atlantic City company.

Public hearings before the Massachusetts Railroad Commissioners, which were discontinued on July 20 for the vacation period, will be resumed September 5.

The Nahant & Lynn (Mass.) Street Railway Company has petitioned the railroad commissioners for authority to issue $50,000 additional stock for construction purposes.

The Brooklyn Rapid Transit Company's annual report is expected to show about 3 per cent. earned on the stock, with gross earnings in the neighborhood of $16,300,000.

The directors of the Kansas City (Mo.) Railway & Light Company have declared a regular quarterly dividend of 1½ per cent. on the preferred stock, payable September 1.

A mortgage for $15,000,000 was recently filed at Media, Pa., by the Philadelphia & Western Railroad Company. It is said that the new road will be operated by electricity.

A director of the Electric Storage Battery Company says the new storage battery which Thomas A. Edison invented is not causing his company any uneasiness, and the practicability of the new invention is seriously questioned.

The recent strength and relative activity in Consolidated Traction of New Jersey is attributed to the fact that the stock goes on an increased dividend basis next year. This year the guaranteed dividend is 3½ per cent. and next year it will be 4 per cent.

The Tractional Company of New Jersey has been organized as a holding company to take over the properties of the International Traction Company which operates trolley lines in and around Buffalo, N. Y. It is said that the New York Central is back of the new company.

One of the Lewisohns says: "Never in history has refined copper been so legitimately strong as it is to-day. There is no surplus anywhere, and there is practically no spot copper to be had at any price. Copper deliverable next March is selling at 16 cents per pound."

The annual report of the Chicago Union Traction Company for the year ending this month is expected to show an improvement of about 5 or 6 per cent. in the matter of earnings, compared with the same period a year ago. The report will not be ready to submit to the court for about 40 days.

Announcement is made of a merger of 32 gas and electric light and traction companies in eastern Ohio and western Pennsylvania by capitalists headed by Murray Verner of Pittsburg, Governor Herrick and James Parmalee of Cleveland, with a capitalization of $10,000,000. The new company will control 175 miles of traction lines and means the linking of Pittsburg and Cleveland by electric railways.

EDITORIAL NOTES.

The Logical Manufacturing Site.

The erection of factories in the near neighborhood of large sources of power has always been regarded as the natural and logical course to follow. These sources of power are even to-day misunderstood, more because of the prevailing custom than through any assumption of theoretical wrong pertaining to such methods. The argument, if any, is one which seeks for a reason for the extraordinary means now employed to develop a factory site far away from the source of fuel or power. In other words, the coal car and the power transmission plant are closely related in this respect, and the relationship is more one which represents a long running bill of expenses than any really legitimate outlay in this class of industrial work. Inherently, the proposition is best understood in relation to a very large factory whose annual power consumption reaches high figures, and whose labor list does not call for such extraordinary talent, that the procuring of it is a difficult or impossible task in a comparatively remote region. But the great coal mines of the United States do not present such flagrant cases of inaccessibility. Quite the contrary is to be witnessed on the ground itself, and the sources of water power are not in any way dissociated from the larger steam roads or thoroughfares.

The logical manufacturing site is one which receives its necessities of fuel and labor where they may be most readily found, not merely where they can be eventually procured. In certain respects, the balance established by industrial enterprises in the fuel and labor problem is not secure. We find electric power going begging for consumers at Niagara and to be had for a low rate. In other sections the labor market is overcrowded and fierce competition results. Seemingly many of our factory sites could bear removal and by so doing simplify this problem wonderfully.

* * *

Epochs as Measured by Radium.

Both geologist and physicist differ in regard to the duration of those epochs which constituted terrestrial time. The evolutionist does not dare to place his life forms as far back as suggested by the geologist. The geologist does not find enough elbow room in the time estimates of the evolutionist to move safely through those great antediluvian periods, when the earth marshalled its chemical forces and a riot of fire and flame preceded the separation of the waters from the land. Keener intellects did not exist than those possessed by the founders of our astronomic ideas. Greater minds cannot be remembered than those whose imagination framed the picture of the cosmic growth. As the years rolled by, and the sages of Egypt and Greece had added all they possessed to the knowledge of the skies, Kant and La Place revived the fading vision and placed it before the thinking world as the Nebular Hypothesis. There we stand, though all the years from Shakespear's time to ours have passed away.

The genius of Newton laid down the universal laws of motion and gravitation, but did not add one single jot to the mystery behind it all. As destiny has so desired it, a woman may be the means by which the highest and greatest triumph of the age will be attained. For it is upon that strange, silent and wonderful pinch of powder obtained by Madame Curie that our greatest hopes are built. It is to radium we look for the answer to the question that agitates the minds of physicist and geologist alike. That gives new hope to the patient astronomer sweeping the wide heavens with his ever observant eye. George Howard Darwin, the son of Charles Darwin, in his address before the British Association states:

"Physicists, from a calculation of the total output of the sun's heat, had regarded it necessary that the whole history of the solar system be comprised within 20,000,000 years. I always believed that the geologists were more nearly correct. Recent marvelous discoveries in physics show that concentration of matter was not the only source from which the sun might draw its heat. Radium was a substance which was, perhaps, millions of times more powerful than dynamite."

It is here that reconciliation is largely assured between the warring forces. Helmholtz believed the contraction of the sun sufficient to reinforce that orb's diminishing temperature. But with the startling facts presented—that radium is always hotter than the surrounding air; that it ceaselessly manifests its extraordinary energy; that it creates from within itself another new element, helium—from these wonderful facts we say a new cosmic process is introduced into the economy of nature. The play and counter-play of electric forces seems to be the new idea, embracing in its scope the tenuous nebula, and awakening within such passive world matter, the power by which it passes through its eternal cycles and transmutes itself into the earth and rocks, the water and wide stretching glades.

* * *

The Advance in Price of Copper.

There is no doubt that a large number of manufacturers believe that the present high price of copper is unnatural and that it should break, but nevertheless the fact is apparent that the largest consumers of refined copper are buying the metal confidently at present prices.

The reselling by Chinese interests of electrolytic at slightly below 16 cents will curtail exports to that center considerably during the present month. The total exports for August amounted to 21,240 tons, of which 2,530 were sent to China. Some persons profess to believe that the demand from China will hereafter be supplied from the Japanese mines, but the cessation of war between Russia and Japan is not expected to materially alter conditions now existing. The copper mines in Japan continued in operation notwithstanding the war, and were not closed as some might suppose from certain statements going the rounds. It is an interesting fact that the production of copper in Japan last year was the largest on record for that country, being returned at 34,850 tons.

A director of the United Metals Selling Company gave out this statement on Saturday: "The sellers of copper have been making an honest effort during the last few weeks to keep copper prices down. A stable market is what is wanted by buyer and seller alike. These efforts, however, have failed. There is practically no spot copper for sale at any price, and you might as well quote electrolytic at 18 cents as at 16¼ cents. We can at present take care of only our best customers. Our people believe that refined copper will average close to 15½ cents all next year."

UNDER THE SEARCHLIGHT.

Notes and Comments on Various Topics.

The annual convention of the Association of Edison Illuminating Companies will be held at the Hotel Champlain, Clinton County, N. Y., on September 12, 13 and 14.

Chicago to New York by trolley is an innovation promised by William S. Reed, a builder of railroads. Mr. Reed has purchased the Chicago Electric Traction Company and has organized two other companies which will complete the gaps which now bar a continuous ride on electric roads between the cities named.

A series of evening lectures on steam and electrical engineering will be given during the coming fall and winter at the New York Trade School, 1st avenue, 67th and 68th streets. These lectures are intended for practical workers—stationary engineers, firemen, electrical workers and machinists.

The American Electro-Therapeutic Association will hold its next meeting in New York City September 19, 20 and 21. Dr. C. E. Skinner, of New Haven, Conn., is secretary.

Two experts from the Swiss Government have been sent here to study electric railway methods in this country. They are W. Wyssling of Zurich, secretary-general of the Swiss commission for the study of the electric railways and commissioner of the Swiss Government for electric railway studies, and Charles Wirth of Berne, Swiss Government engineer. The significance of their visit is apparent when it is said that the Swiss Government plans to electrify all of the Government lines and to operate these lines from water power plants, utilizing the mountain streams as a source of energy.

In order to detect and localize without loss of time a burnt-out lamp on telephone switchboards, Mix & Genest of Berlin, Germany, have devised a double-filament signal lamp, says the London "Electrician," According to the "Electrotechnische Zeitschrift," one of the filaments is of the ordinary kind, while the second filament (which is in parallel with the first) has a high resistance. As long as the ordinary filament is intact, the auxiliary filament is scarcely noticed. Should the filament proper fail, however, the dull red light of the auxiliary filament will continue to record a call, and will give notice, at the same time, that the ordinary filament has collapsed.

It was announced Monday that two of the big electric locomotives which are expected to be used in dragging trains through the Pennsylvania Railroad's tunnel would be delivered on the Long Island Railroad tracks within a day or two. The locomotives are ponderous 100-ton machines each of 2,400 hp. Before they are accepted for use in the tunnel they will be thoroughly tested on the electrified parts of the Long Island Railroad, where conditions, including the power-rail equipment, are similar to those that will prevail in the tunnel.

Portugese newspapers announce that an important discovery has been made in the province of Traz-os-Montes. A mineral said to contain a large amount of radium has been found there.

An electrically-driven oil boat, 245 feet long, 32 feet beam, and rated at 1,100 tons, has been built for the Russian oil trade, using three Diesel oil engines for the production of power, which is transmitted electrically to motors operating the propellers. The engines are placed amidships and the oil tanks forward and aft. The entire control equipment for the motors is situated in the pilot house.

The Old-Time Telegraphers' Association at the meeting last week in New York elected W. H. Young president to succeed John C. Barclay. W. L. Ives was elected vice-president and John Brant secretary. The festivities concluded with a big banquet on Thursday night. Among those present were Thomas A. Edison, Clarence Mackay and a number of gentlemen prominent in electrical circles.

THE SUBMARINE MINE AS A DEFENSE IN WARFARE.

BY A. FREDERICK COLLINS.

It is doubtful if there is any other single factor in modern warfare that induces such genuine dread in both officers and crews of offensive naval fleets as the invisible destructive engines known as submarine mines.

Men trained to look danger in the eye, to laugh at fear and to die smiling, usually welcome a battle of any kind, be it a hand-to-hand struggle or a running fight of armored cruisers, for they are sure of ultimate success regardless of the odds against them, but to be blown up without a ghost of a chance is much like dying the death of a spy, and hence a thing to be studiously avoided.

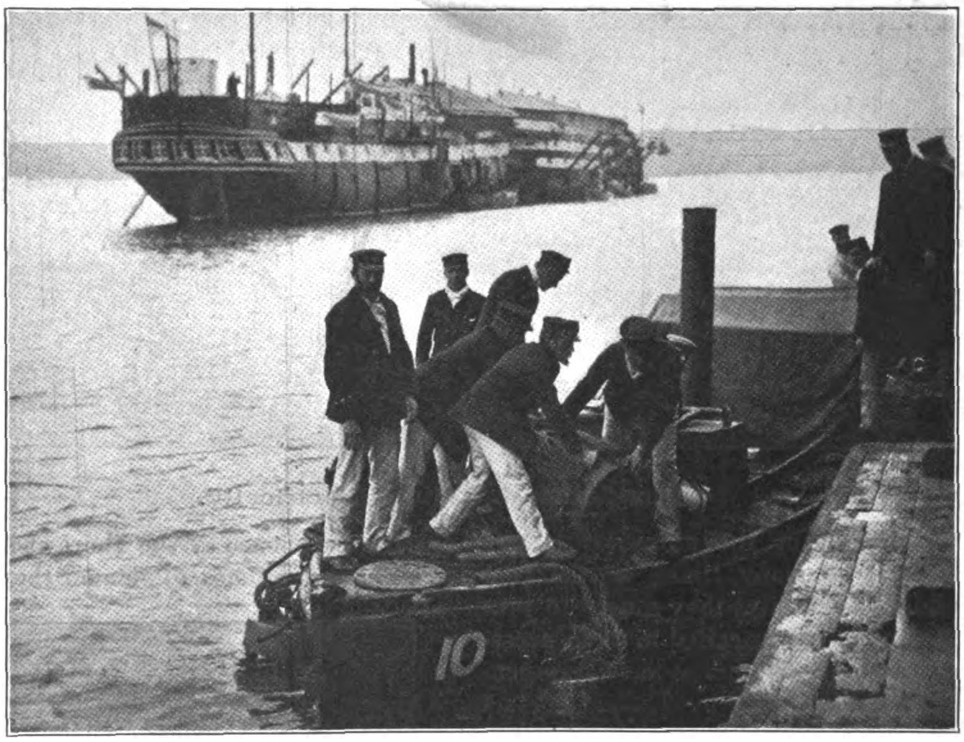
A few years ago representatives of the civilized nations assembled at The Hague to formulate rules to be observed by belligerent powers who might, perchance, prefer to settle their differences by force of arms rather than by arbitration, and one of the articles incorporated in the recommendations was the elimination of balloons or other forms of ærial devices carrying high power explosives, which could be hurled overboard and at one stroke annihilate whole fleets and armies, forts and towns.

On first thought the submarine mine would seem to be as barbarous a mode of destruction as the ærial explosive bomb, for the former like the latter is an unseen element and retaliation by combat is out of the question, yet it possesses a few features that enables it to remain in the class of legitimate destroyers as authorized by the civilized code of warfare.

The chief claim in this respect is that it can be used only as a defensive agent, and then the fact that its powers are limited to a certain circumscribed area—since it is arranged to explode under the vessel that comes in contact with it—renders its use not only permissible but quite justifiable as well. All mines, however, are not arranged to explode by actual contact, for there are many kinds operated in various ways, and so diversified and important is this branch that no navy department is considered complete nor could it be up-to-date without a special school for the training of its sailors in the art.

In the bitter engagements between the Russians and Japanese fleets that have been waged so mercilessly the submarine mine has played no minor part, and it is common knowledge that had not the harbor of Port Arthur been literally covered with these infernal engines and the moral effect they had on the blockading fleet the Russian ships would have been smashed and the land batteries silenced many months before they were and the war terminated long ago.

During the early period of the war Russian vessels occasionally ran amuck of their own mines, in which case it was evident that the mines were of antiquated design; since fulminating caps and guncotton are no respecters of nations the very ships they were intended to protect have been blown up, the crews killed and the fleet in the harbor crippled, all of which goes to show how exceedingly careful those having the mines in charge must be to prevent premature explosions.



Placing Submarine Mines.

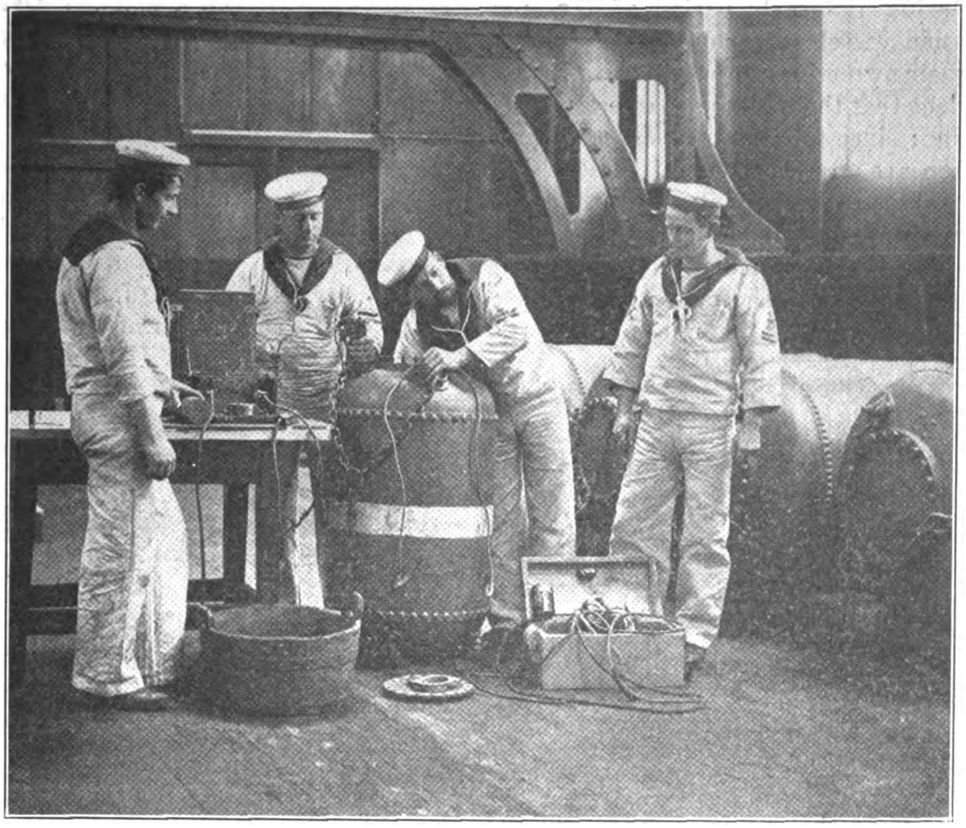
The art embracing the submarine mine and the mining of harbors dates back only to the time of our own Robert Fulton, who may be said to be the inventor of the first submerged mine and the father of this method of defense, for it was he who first exploded a charge of gunpowder under a vessel which was promptly sunk.

From that day to the present time submarine mines have been more or less extensively employed for the protection of harbors, but the standard of efficiency to which they have been brought during the last few years has been chiefly due to the advent of high explosives and electrically-operated devices for exploding them.

Prior to electrically fired mines those that were purely mechanical in operation were extensively employed, and during the war of the rebellion both the Northern and Southern navies made use of a primitive mine formed of a keg of gunpowder and a firing mechanism consisting of a percussion cap, made of a salt of fulminuric acid or fulminate, which would, when struck, produce an explosion and thus ignite the powder. Over the fulminating cap a hammer was so adjusted that it would not strike unless it was pulled quite vigorously; to produce this result at the desired instant a wire connected with the hammer and also to a heavy weight resting on top of the keg.

The keg and firing device was now anchored in the harbor so that if the keel of a vessel should be so unfortunate as to come in contact with it the weight would be dislodged and in consequence would release the hammer, when the inevitable explosion took place. A later contact mine, in which the ignition of the powder was accomplished by a much more ingenious and safer arrangement and by which the uncertain mechanism of the first was gotten rid of, consisted of an iron shell filled with the explosive and from the upper and exterior surface of which and connecting with it were lead tubes which projected to a height of a foot or so.

Inside these leaden tubes there were glass tubes filled with sulphuric acid while between the glass and the lead tube a mixture of chlorate of potash and sugar was placed. The chemical action of the latter ingredients when combined with the acid causes an instantaneous combustion, and this is exactly what took place when a ship's hull struck one of the lead-incased glass tubes, for the sudden impact shattered the tubes, brought the chemicals into active relationship, setting fire to the gun-cotton, which promptly exploding blew up the ship that struck it.

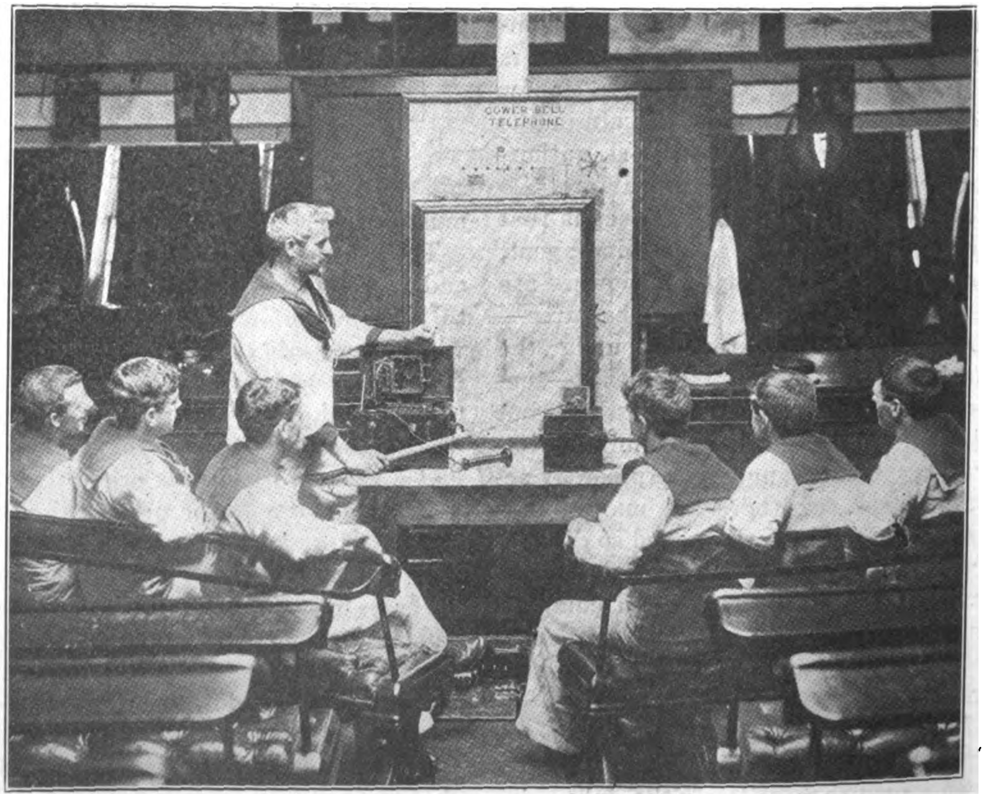


Testing Submarine Mines Electrically.

To circumvent the untoward results that have so many times in the past annihilated the ships they sought to protect, electricity was called in as an accessory, and electrical mines have very generally superseded the mechanical contact mines except in some specialized cases. Like those described the electric submarine mine is a stationary torpedo arranged for the defense of a harbor.

Harbors are protected by placing a number of mines in positions so that they may be readily exploded by means of an electric current from the shore and fired when the ships of the enemy pass over them, yet when the current is cut off it is absolutely impossible to explode them. The mines utilized in modern practice usually contain from 1 to 500 pounds of some high explosive packed in watertight steel cylinders anchored in accurately determined positions and connected with the shore by electric cables.

An operating room at the shore end of the cable is furnished with batteries, contact or firing keys, etc., these comprising the necessary appliances by which the mines can be exploded at a distance by the transmission of an electric current through the cables; in some types of electrically-operated mines they are equipped with automatic circuit closers in which two central projecting points on top of the mine are closed by the passage of a ship. When the home or harbor fleet wishes to manœuvre the circuits are opened at the shore end, but at night and in times of danger they are kept closed, rendering the wires inoperative and harmless or active and destructive as desired.



Instruction in Testing Apparatus on H.M.S. "Vernon."

Another arrangement provides for a weak current constantly flowing through the mine circuit and too feeble normally to ignite the fuse, but instead merely closes a relay in the operating room, which in turn sends a current through a bell or indicator. In time of war, however, the relay closes the circuit when a current flows strong enough to heat a little piece of platinum wire red hot, and this ignites a fulminate of mercury cap when a primer of dry gun-cotton is fired, the detonation of which explodes the full charge of damp gun-cotton in the mine.

Observation mines similar to those of the electrical type just mentioned, but which are fired by observers closing the firing circuit manually, are to be found in the best protected harbors of the world, and it was this kind of mine that wrecked the ill-fated Maine in the harbor of Havana in 1898. Observation mines are submerged either singly or in groups of from three to half-a-dozen, and the cables leading from them to the shore are so laid that the enemy cannot cut them without being exposed to a withering fire from the land batteries.

In this type of mine the operators are located on the shore at two different points, so that a triangle is formed with the mine as the third point. The mine is connected electrically with both the operating stations and in such a way that it can only be exploded when the firing keys in both positions are pressed at the same instant. Thus when one of the mine pickets, as the operators are termed, observes through his glass that the enemy's ship is in a position so that a straight line could be drawn from his eye through the vessel and over the point where the mine is anchored, he presses the firing key; if the second picket also observes the ship passing over the visual line connecting his glass and the mine he likewise presses his key, and if both these keys are pressed simultaneously the mine will be exploded.

It is evident that if only one observation was made showing the vessel on the line and apparently directly over the mine it might be several hundred feet to one side or the other of the submerged explosive, but two observations taken simultaneously from different angles will instantly show whether the vessel is over the desired spot. Recently an invention has been brought out which enables a single operator to determine with absolute precision the position of a vessel, but this naturally requires a much more complicated piece of apparatus.

The testing of a mine is an important feature and each wire is connected to the shore station by a telephone, and when the mine is operative the telephone responds by emitting a humming sound. If this test fails the mine must be brought to the surface of the water and carefully inspected.

The officers of a ship are of course trained in naval academies, but the sailor, who often becomes an adept and sometimes more so than his superior officer, must be taught the principles and drilled in the practice on board some vessel that is especially equipped for the purpose. The illustrations shown were taken on board H. M. S. "Vernon," which constitutes the Naval School of Mines of the British Navy.

IS THE WIRING CONTRACTOR DOOMED?*

BY S. W. WILKINS.

The existing state of the electrical trade is one that affords much food for thought. A transition is happening before our eyes; a new order of things is coming. The past 20 years have witnessed the ruthless exploitation of the great wiring boom, in which fortunes have been made and large businesses built up. Now the trade is settling down to its normal proportions, and we are face to face with the fact that the past affords no indication of the future, and that with the end of the boom the trade has to be carried on under different circumstances entirely. The manufacturing houses can seek new fields abroad, and they have usually so many irons in the fire that dividends can be secured by the elimination or neglect of the unprofitable lines to make room for the more remunerative branches. With the wiring contractor, however, matters are on a different footing. His business is confined within rigorous lines, and there is not usually any room for setting one branch of the business against another.

The wiring contractors' trade a few years ago was a very good one to those who knew their business. The advantages of electric lighting were apparent, and there was a splendid field among the classes to whom first cost was not a great matter, and who did not need to weigh too closely the relative rates for gas and the new illuminant. A large and profitable business was done in apparatus and fittings; new developments were constantly arising to give impetus to trade, and the whole industry prospered. The relations between the wholesale houses and the retailer were the same as those existing in other trades; the retailer was regarded as the necessary distributor of the manufacturer's goods, and the two branches worked in harmony and with mutual co-operation. From these halcyon days down to the present there have been influences at work which have completely changed the whole aspect of affairs. Keen competition has, of course, been the most potent of these influences, but it seems beyond dispute that over and above the ordinary incidences of trade fluctuations, the state of affairs in the past has been abnormal, and that the industry as a whole is now settling down into its groove. What is that groove to be? How are matters going to adjust themselves in the future?

One of the most noticeable features in this evolutionary process has been the disappearance of the mystery surrounding electricity. The man in the street has a very fair general notion of the eccentricities of "juice," and the enterprising ignoramus who has the temerity to inscribe "Electrical Engineer" over his doorway does not strike awe into the passer-by, and find himself regarded as a man of science. Under existing conditions, it is the easiest matter in the world to get together a staff of competent wiremen, if one knows how to go about it. The qualifications necessary to a man before he can undertake a wiring job are so comparatively small, and are possessed by so many, that the number of men willing to undertake such work is legion. Every contractor has his eye on the ever present danger of his right-hand man, after lying low for a few years, leaving his employer to start work for himself, but taking as much of the connection away as possible. It is certain that there can be no lasting stability about a business where such manœuvres are so easily practicable. The result is naturally a gradual process of devolution, the substitution of a horde of master wiremen for the old contracting firms. Such a state of things affords a most tempting bait to other partially allied trades. The builder, the ironmonger, the house decorator and jobber, and the stores, find little difficulty in annexing such electrical work as is going on in their neighborhood. The extra capital required is not great, the stock need be but small, the wholesale houses will give lowest trade terms for the asking, while good wiremen will besiege the doors for employment. Such is apparently the future of the electric wiring business. It must eventually be grafted on the other trades; it is not sufficient to stand by itself under normal conditions; and the above are the trades which are destined to work it. In all branches of electrical work requiring more than ordinary skill, and to which a great responsibility is attached, the manufacturers will invariably step in to do the work, either directly or indirectly. Practically all power installations are now taken by the makers of the machinery, and gradually all pretence of the intervention of a trade man is being dispensed with. Competition is so terribly severe in this class of business that if the manufacturers can only keep their factories going on full time regularly they esteem themselves fortunate. Profit is, of course, highly desirable, but not always obtainable nowadays in motors, and two profits are absolutely out of the question. The same remarks apply in a lesser degree to the general sale of electrical material. Most articles for use with the electric current are fairly costly, and the purchaser will only buy from a firm of good standing and repute—the maker, if he can ascertain who the maker is. Competition is driving the makers to encourage this class of business, and by degrees the contractor is being eliminated. The process is facilitated by the growth of the small man, who is willing to wire up customers' own goods—a thing which the contractor of the old days would have scorned to do without his discount.

The combination of circumstances against the contractor is deeply to be regretted by the trade as a whole. To this cause is attributable the vast amount of shoddy work now being done, with the inevitable ultimate consequence of bringing a certain amount of odium upon electric work in the public eye. Fires, leakages, short circuits, constantly blowing fuses, and all the usual accompaniment of faulty wiring, have been very much in evidence of late, as any one who has had much to do with installation inspection can testify. This, coupled with the growing awakening of the public to the undoubted costliness of electricity at present rates, and the remarkable recrudescence of energy on the part of the gas companies, has had the effect of giving a decided set back to the progress of electric lighting.

---

*From the "Electrical Review," London.

In the wholesale and manufacturers' side of the business, the trend of events has effected similar changes, though not with similar results. Competition has become very keen, prices are very low and profit small. New firms of comparatively small capital have sprung up in all directions, either for manufacturing and specializing in one particular class of goods, or for factoring foreign articles. Competition and the decline of the general contractor are gradually compelling all wholesale houses to treat with the general public. They are being loudly blamed for this, but it is not due so much to faulty policy on their part as to the inevitable march of events. In the absence of a strong and prosperous army of retailers to act as the distributors of their goods, the manufacturers must necessarily take on such distribution themselves. Needless to say, they do not wish to do it, as they usually have no machinery for this class of business, but they must look ahead and make provision for the future from a natural instinct of self-preservation.

The attempt on the part of the municipalities to get powers to supply goods through the medium of their generating stations is a sign of the times. With the central stations equipped with showrooms and a commercial department, the electrical trade would be on a level with the gas companies. However one may be opposed to municipal trading, there is something to be said for the promoters of the scheme. The general public have now very few opportunities to inspect the latest things in electrical apparatus; the ignorance of the man in the street regarding the various articles now available for use with the current is remarkable. In short, electrical goods for use on the ordinary house supply are not being pushed. The contractor apparently cannot do so; therefore either the central stations or the manufacturers must do it. The Municipal Supply Bill is a step towards the former; the forthcoming great exhibition at Olympia is a step towards the latter. What will be the final result?

HOTEL WIRING.*

It is the fashion on the Continent much more than here to arrange incandescent electric lamps so that they may be controlled from more than one position. In this country we have hitherto limited the application of the principle mainly to corridor and hall lighting. To be able to switch on a light from either end of a corridor has been recognized as a convenience and adopted, while the same applies in the case of a hall or landing light, which can be controlled from both the foot and head of the staircase. Continental engineers have, however, given the system wider application. In a German hotel, for instance, it is not unusual to find that a bedroom lamp or lamps can be controlled from two different points. Complications are necessarily involved, but convenience is held to be of primary importance in these matters. In a contribution to the "Elektrotechnischer Anzeiger" "A. H." describes some current practice. The diagram (Fig. 1) represents a common arrangement of connections. In this example the lamp, L, is supposed to be fixed in a central position for general illumination, while one single-pole two-way switch, U_1, is placed near the door and another, U_2, within convenient reach of the bed. The lamp, it will be seen, may be controlled from either switch at will. The switches themselves are preferably of the quick make-and-break two-way type. The only complication and possible extravagance where the local conditions are unfavorable is the necessity for three connections to each switch. When surface wiring on porcelain insulators with treble flexible is used it looks ugly, and with conduit wiring it is frequently found necessary to lay two tubes, apart from any preference which may be given to separate wires on account of greater safety. Reverting to the diagram, it should be mentioned that s_1 and s_2 represent fuses. Should it suffice to control the lamp from different points by means of two switches, S_1 and S_2, arranged in parallel as shown in Fig. 2, the connections are considerably modified, two wires only, frequently but one, being then required between the switches, while the substitution of simple for two-way switches represents a further advantage. The use of but one switch wire is possible when a convenient and short connection can be made to the main conductors as indicated by the dotted line in Fig. 2. But this involves the introduction of a third fuse, s_3, whose maximum capacity, together with that of the parallel fuse, s_2, must not exceed that of the lamp lead, l. This arrangement enables the lamp, L, to be switched on from either of the two positions, but both switches must be set in the off position before it can be extinguished. In order to obtain maximum convenience from the arrangement it must, therefore, be remembered to set the door switch to the off and the bedside switch to the on positions respectively before retiring. Another arrangement frequently met with includes two lamps so connected that only one can be used at a time. A suitable, and at the same time simple, means of accomplishing this end is illustrated in the diagram (Fig. 3).

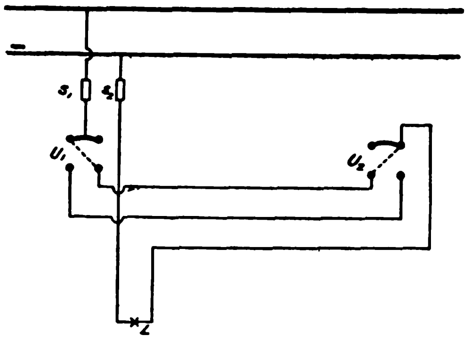


FIG. 1.

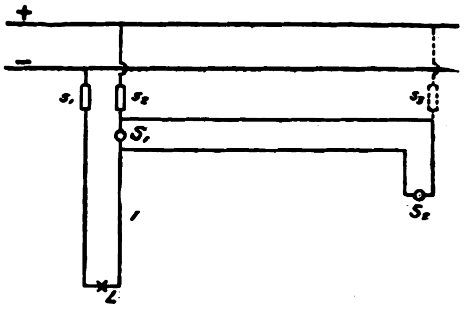

FIG. 2.

It is assumed here that one of the lamps, L_1, serves for the general lighting of the room, while the other, L_2, is fixed near the bed or writing desk, but in any case may be extinguished through a switch, S, placed within convenient reach of the bed. Referring to the diagram, it

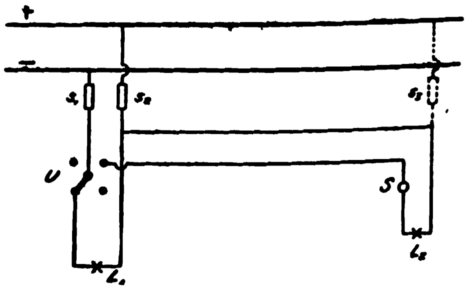

FIG. 3.

---

*From the "Electrical Engineer," London.

will be seen that a two-way switch, U, and an ordinary single-pole switch are requisite in this case, while between the two, as in the previous example, two wires are required at the most and frequently under favorable conditions only one. A dotted line is again employed to represent the alternative connection whereby it would be possible in favorable circumstances to effect the saving in question. But in that event it would be necessary to add a third fuse, s_3, of equal capacity to the other two. When complexity and cost are secondary to convenience the arrangement just described may be modified as shown by the diagram Fig. 4. This modification enables the second lamp L_2 to be controlled—say, from the door switch, when the other switch is in any position. In the case of the arrangement, Fig. 3, on the other hand, with the simple switch s open, it would be impossible to switch on the second lamp L_2 from the door. But in addition to a greater number of wires the arrangement, Fig. 4, involves the use of a two-way and a three-way switch, U_2 and U_1, respectively.

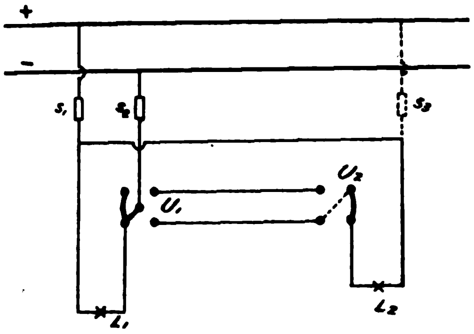

FIG. 4.

In conclusion, reference may be made to an arrangement for controlling three lamps so that one only can be used at a time, This condition necessitates the employment of a three way switch, U_1 (Fig. 5), provided with intermediate dummy contacts, so that in the positions 1, 2 and 3 the corresponding lamps, L_1, L_2, or L_3, are switched on, while no circuits are closed through the dummy contacts. It is assumed that the lamp, group of lamps, or electrolier, L_2, serves for the general illumination of the room, while L_1 and L_3 are desk and bedside lamps respectively. It would be well, adds "A. H.," to provide the last-mentioned, especially the bedside lamp, with separate single-pole switches or switch-holders for local control. The dotted line indicates how a possible saving in wire might be affected. But here, again, this saving would entail the use of a third fuse.

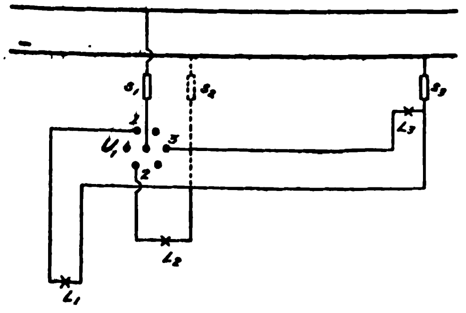

FIG. 5.

WIRING FOR LAMPS AND MOTORS—MEETING AN EMERGENCY.

BY W. H. WAKEMAN.

ARTICLE I.

The incident which constitutes the basis for these articles is presented at this time because it will amuse readers who are expert electricians and benefit others who are always looking for "pointers" that serve to instruct in the art of wiring an electric plant, and assist in presenting plans for meeting emergencies as they arise in every-day practice.

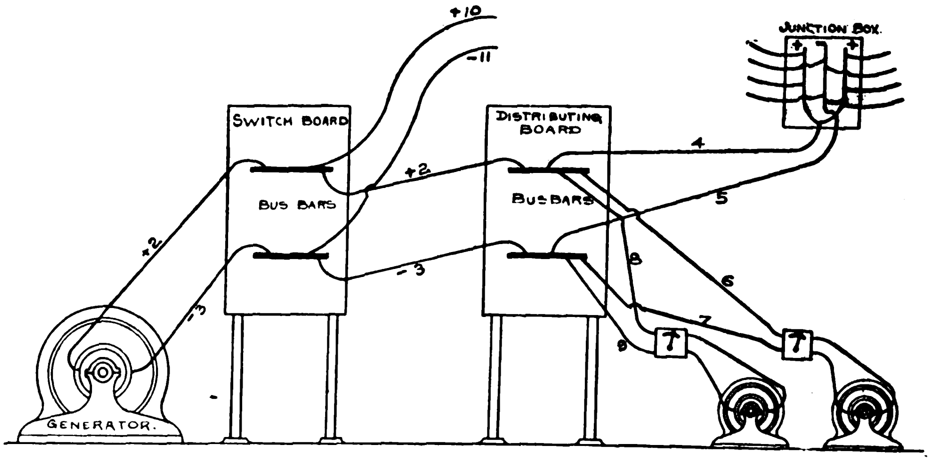

FIG. 1.

Inasmuch as this is a portion of my own experience in an electric plant forming part of the equipment of public buildings, I do not wish to give it greater prominence than its importance calls for, but having debated mentally the question as to whether it is of enough value to warrant its publication, and decided that a full description of the plan of wiring, also of changes made to meet an emergency, contains valuable points, they will be presented in full, as otherwise the matter would not be valuable to anybody. Switches and other unnecessary details are omitted for the sake of simplicity.

The generator in Fig. 1 supplies a 110-volt direct current for incandescent lamps and induction motors. The wires 2 and 3 transmit this current to and from a switchboard in the engine room. From these bus bars it goes to a distributing board located in another building. This board is supplied with three bus bars, as the building is fitted to receive either the two or three-wire system of transmission, but as the former is used here, only two bars are shown.

There are six switches on this board, but only the main switch and two others are concerned in this description. One of these controls the wires 4 and 5 taking current to and from the junction box shown.

This is supplied with fixtures for a three-wire system, but as only two are used the positive wire 4 is spliced, thus dividing the current and supplying the two outside wires while 5 is the negative wire.

Here we have a distributing board and a junction box both fitted with three wire fixtures, but they are connected with two wires only and the system works perfectly. This naturally causes us to ask why provision is made for three wires when only two are wanted. This may be explained for this case by saying that two wires answer every purpose for the amount of current wanted, but if more is required than these can carry, another generator must be put in and three wires substituted for the pair now used. This is one way of providing for more current to be used in the future.

The other switch controls two 20 hp. motors, the wires 6 and 7 connecting with a rheostat and starting lever, thence continuing to one motor. The wires 8 and 9 connect with another rheostat, thence continuing to the other motor.

The generator is driven by a direct connected engine, at 300 revolutions per minute, maintaining the required voltage with very little vibration, although it rises when more load is put on, showing that the machine is "over-compounded."

The wires 10 and 11 in Fig. 1 connect with 10 and 11 of Fig. 2, forming a cross-connection between the two switchboards that can be used as follows:

The dynamo in Fig. 2 supplies a direct

current at 110 volts to operate lamps in another building, although both generator and dynamo are in the same engine room. Current is carried to and from the switchboard by wires 12 and 13, but if for any reason the dynamo is not used current can be taken from the generator (Fig. 1) coming over wires 10 and 11, which connect with 10 and 11 (Fig. 2), as already mentioned, thus making it possible to run one machine only when but a small amount of current is wanted.

Under these conditions the voltmeter and ammeter (Fig. 1) operate as usual, while the voltmeter (Fig. 2) follows the other but cannot be varied by its own rheostat. The ammeter is not affected.

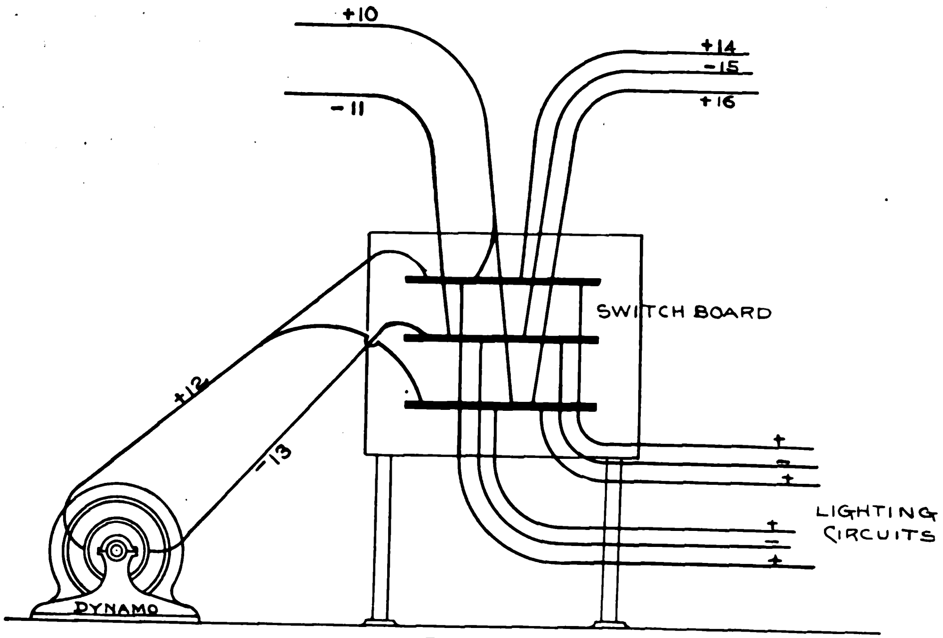

Fig. 2.

On the other hand if the generator (Fig. 1) is idle current may be taken from the dynamo (Fig. 2) and transmitted over wires 10 and 11 to the switchboard (Fig. 1).

Under these conditions both voltmeter and ammeter in Fig. 1 must be disconnected, as current passing through them in the wrong direction tends to force both pointers backward. Both instruments in Fig. 2 operate correctly.

It is not practical to operate these machines together in multiple for the following reason: The generator is fitted with 10 poles and revolves 300 times per minute at a practically uniform speed, causing very little vibration of the voltmeter.

The dynamo is fitted with four poles, and while it is calculated to revolve 1,050 times per minute the speed is very unsteady, causing the voltmeter pointer to vibrate a maximum of 20 volts at times. The engine which drives this dynamo revolves 75 times per minute nominally, but it is fitted with a governor that allows much variation in speed. This engine drives other machinery, and as this gives an ever-changing load it accounts for the vibration mentioned.

While it is not impossible to run these machines in parallel, I have considered it safer and better, owing to the reasons given and other conditions peculiar to this plant, to keep them in separate operation.

In the circuit formed by wires 10 and 11 there are two switches, one on each switchboard. If both of these were thrown in, while generator and dynamo are in use, it would undoubtedlv cause trouble, and as ever-changing conditions call for frequent changes in switches, it is necessary to use much caution to prevent accident. In every such case the engineer should stop a few seconds and consider the effect before throwing in a switch. This is recommended without regard to the fact that the engineer is often in a hurry to do something else. It takes but part of a second to throw in a switch, but it may take several days and a respectable sum of money to repair damage caused by throwing in the wrong one.

Tantalite Incandescent Lamps.

In the course of a lecture at a joint session of the Technical and Electrotechnical Associations of Frankfort, Dr. Feuerbach, a director of the incandescent lamp works of the electrical establishment of Siemens & Halske, Berlin, said the tantalite incandescent lamp was the result of years of experiment by the firm of Siemens & Halske. Dr. von Bolton, chemist of the Siemens & Halske works, after laborious and painstaking experiments, first succeeded in obtaining pure tantalite. Tantalite is a heavy mineral with a grey metallic luster, extremely resistant to acids and alkalies. Its melting point lies between 4,092 degs. Fahr. to 4,172 degs. Fahr. The technical use of large quantities of tantalite is at present impracticable, as one pound of this element costs nearly $5,000. Of what importance the chemical and physical properties of tantalite are for the industries is shown by the fact that Siemens & Halske, for the various processes of manufacture and use of tantalite, have taken out more than 200 patents in Germany and other countries. The incandescent lamp with a tantalite instead of a carbon thread requires only one-half the current of ordinary incandescent lamps of equal light power. With the same strength of current the tantalite lamps give double the light of the carbon incandescent lamp and the light is much whiter. The lamp now being made is pear-shaped like the ordinary incandescent lamp, and the thread has a length of 25.29 inches, and is 0.197 inch in diameter.

DETERMINATION OF THE SPECIFIC ELECTRICAL RESISTANCE OF COAL, ORE, ETC.*

BY G. C. WOOD, B.SC.

Introduction.—The samples of coal, ore, etc., used in this investigation may be grouped as follows: (1) Coal, and the rocks lying immediately above and below; (2) ironstone, and the rocks lying above and below; and (3) lead-ore and the adjacent rocks. In order to obtain the electrical resistance of the coal, ores, etc., the specimens were worked into shapes with parallel faces. A paste of black-lead and water was spread evenly on the faces and dried. A copper plate was cleaned, on this was laid a sheet of tinfoil, and on this again was placed the sample with one of its blackened faces on the foil. On the top of the specimen was placed another sheet of tinfoil and then another copper plate. Thus contact could be established at the two copper plates, and such a weight was laid on the top as experiment showed would make good contact. The method employed in the measurement of the samples was one or other of the following: (a) Wheatstone bridge; (b) high resistance substitution; and (c) the high resistance leakage. The specimens of coal examined were supplied from the Cowpen, Harton and Murton collieries. The iron-stone was supplied from Skelton Park mines. The lead-ore examined was supplied from the Greenside mines, near Penrith.

The author describes in detail the experiments made on six kinds of coal as obtained from the three collieries mentioned in the Newcastle district. The actual figures will be found in the table which appears at end of this article. In order to show the method of procedure we give the following details of the experiments made on the Cowpen Colliery coal. The specific resistance (a) of the black shale roof was determined by the (b) method with a piece with an area of 130.4 square centimeters and a thickness of 1.2 cm., and was 4,090 ohms, and the specific resistance was 444,800 ohms per cubic centimeter. The resistance of another piece with an area of 29.8 square centimeters and a thickness 1.12 cm. was 16,800 ohms, and the specific resistance was 446,400 ohms per cubic centimeter. The mean specific resistance was 445,600 ohms per cubic centimeter.

---

*Abstract of paper read before the Institution of Mining Engineers at Newcastle-on-Tyne, England.

Coal.—The sample of gas coal supplied from this colliery was of such a shape and so easily worked that one piece was obtained of fairly large cross-section. The resistance (method c) of a piece with an area of 96.3 square centimeters and a thickness of 3 cm., was 1,120 megohms, and the specific resistance was 36,000 megohms per cubic centimeter.

Grey Sandstone Thill.—The resistance (method b) of a piece with an area of 30.2 square centimeters and a thickness of 2.8 cm. was 1,900 ohms, and a specific resistance was 20,500 ohms per cubic centimeter. The resistance of another piece with an area of 18.4 square centimeters and a thickness of 1.2 cm. was 1,310 ohms and the specific resistance was 20,100 ohms per cubic centimeter. The mean specific resistance was 20,300 ohms per cubic centimeter.

The experiments on the iron stone and its surrounding strata were carried out in the same way, and the experiments on the lead ore were likewise similar. In this case, however, smaller samples were used. The results obtained with direct current and small voltages were confirmed by other experiments, using variable current in a Wheatstone bridge method. In this case the telephone took the place of the galvanometer and a microphone was inserted in the battery circuit. Other experiments with voltages of 100, 200 and 220 volts were used for determination of the resistance of the samples which were connected in series with the voltage and with a tangent galvanometer. For all the specimens that could be measured this way it was found that there was practically no difference from their resistances as obtained. The samples of coal had too high a resistance to be determined by this method. From an examination of the results of the tests, as given in Table 1, it will be seen that lead ore is the only ore which, by practical tests, based on differences in electrical resistance of large masses, could, with certainty, be distinguished from its surrounding rocks. It may also be noticed that coal, and especially hard steam coal, has a comparatively high electrical resistance. This important result should be borne in mind in connection with practical work. The following values in megohms per cubic centimeter indicate the magnitude of the specific resistance of coal and other well-known bodies: Gutta-percha, 400,000,000; arc-light carbon, 0.000,000,004; and coal, say, 40,000. Coal has, consequently, ten million times greater resistance than arc-light carbon, and ten thousand times less resistance than gutta-percha of the same dimensions.

The author had previously experimented with the carboniferous limestone used as ballast on the North-Eastern Railway, and found a specific resistance of 1,014,000 ohms per cubic centimeter. A piece of cement concrete flooring was found to have a specific resistance of 754,000 ohms per cubic centimeter.

TABLE I.—Specific resistances of Minerals found in Mines.

Name of mine.	Description of mineral.	Specific resistances per cubic centimetre (ohms).
Cowpen	Roof: black shale	445,600
Ditto	Gas coal	36,000,000,000
Ditto	Thill: grey sandstone	20,300
Harton	Roof: black shale	337 500
Ditto	Steam coal: top panel	80,100,000,000
Ditto	Ditto bottom panel	*
Ditto	Gas coal	33,000 000,000
Ditto	Coarse coal	3,396 000,000
Ditto	Thill: bluish-grey posty shale	105 900
Murton	Roof: soft blue shale	432,900
Ditto	Coal	33,900,000,000
Ditto	Thill: blue shale	13 000
Skelton Park	Roof: dogger rock	52 100
Ditto	Ironstone	167,000
Ditto	Thill: bottom rock	52,050
Greenside	Lead ore	7?
Ditto	Old red sandstone	8,375 000
Ditto	Mountain limestone	2,900,000

* This value is omitted from the table, as the specimen contained iron pyrites.

WRINKLES.*

EDITED BY H. C. ABELL.

A Cheap Vacuum.

An artesian well with a good head of water is very valuable for condensing purposes. We have had such a well in use for the past ten years and at present we are still using it. The well is an eighth-inch well, bored on the banks of the San Antonio River, immediately back of the plant. It has a pressure of 15 pounds at the mouth of the well, and the head water, if measured above the water level of river, is 49 feet. This is sufficient head to carry the water to a Buckley condenser, injector type, which is placed on the roof of the plant. After the water does its work the greater part of it—that is, the overflow of the hot wells—flows away into the river, nothing being lost by this waste of water.

It is a valuable asset, for it needs absolutely no attention and repairs. Besides, it saves the first cost and maintenance of pumps and steam to run these pumps, also the cost of water and cooling towers, if the water had to be purchased. Among the other good features that the well presents is that it needs no attention that pumps would require, always giving us a steady stream of water, and we never need fear a "lost vacuum" for lack of water.

G. H. CUSHMAN,
San Antonio, Tex.

Scheme to Avoid Lifting Feed Water.

A represents deep well; B, an electric pump; C, a pump; D, a steam pump for pumping water from C to tank H, on roof of boiler house; G, closed feed-water heaters; F, open feed-water heater; E, boiler feed pump; M, batteries of boilers;

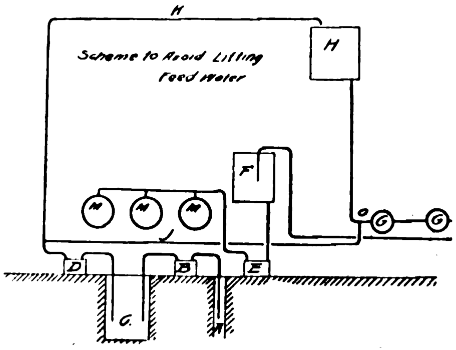

DIAGRAM OF CONNECTIONS.

K, old line to tank on roof; J, new line running from D to O, the outlet pipe from supply tank.

The feed water is pumped direct from D to G through J, while formerly it was lifted to H, a vertical distance of 60 feet. Now only the excess water is lifted to supply tank. Heat is also saved, as water in C is heated to some extent.

B. E. BUTTLES, Denver, Col.

An Approximate Method of Metering the Boiler Feed Water.

We experienced a good deal of trouble with the water-meter used to measure our feed water, until one day we had to discard it altogether. To keep tab on the water used, an old integrating wattmeter counter was rigged up with a ratchet and pawl on the last dial and fitted on our feed pump so as to go forward one division for every stroke of the pump. From the size of the plunger and stroke one can calculate the amount of water per stroke. The leakage coefficient of the pump has to be determined, and this is often very hard to get at accurately. However, from observations taken, this coefficient was found to remain practically constant, and at the worst with the above outfit you can get a very good comparison of the feed-water consumption from day to day.

*Paper presented before the National Electric Light Association at its 28th convention, held at Denver-Colorado Springs, Col., June 6-11 1905.

L. Denis, Montreal, Can.

Operating Engines Condensing When Short of Water.

The steam plant in connection with the Quebec-Jacques Cartier Electric Company is used as an auxiliary in case of trouble or breakdown at the water-power plant in summer time, and to help out the latter regularly in winter, when the load on the plant increases considerably.

The diagram shows the arrangement and piping of our water tanks. Under ordinary conditions the cold-water tank is supplied from the city main through a pipe—which is not shown—and the hot well is allowed to overflow into the drain pipe. The boiler-feeder pump is supplied from either the hot well or the cold water tank by opening valve A or valve B.

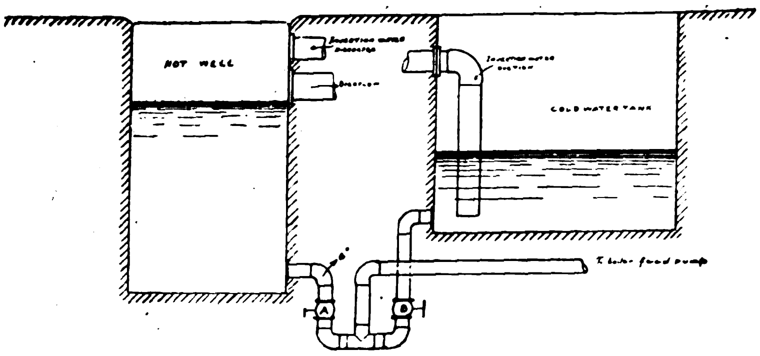

Diagram of Connections.

On the particular occasion referred to, the city unavoidably had to shut off the water for a whole day to repair a leak, and it was up to the steam plant to run at least one 500 hp. set to help out the water-power plant. The tanks were practically full and it was thought at first to run non-condensing, but, even then, we should not have had water to run more than three or four hours, so the following plan was tried and found to work remarkably well:

A condenser pump was started as usual, and the feed-pump piping had valve A open and valve B closed. The water in the cold-water tank was allowed to drop about 1 foot below the level of the overflow in the hot well, then valve B was opened. The difference of level between the two tanks allowed the water to flow from the hot well to the cold-water tank through the feed-pump piping, thus practically losing no water. The only thing remaining to be done was to keep the water in the cold-water tank cool. This was done by keeping the tank well provided with snow, which we had in plenty, but it kept two men and a rig busy carting. The melted snow more than overbalanced the water lost through leaks or otherwise, and this plan could have kept us running almost indefinitely, as long as we could have been kept supplied with snow or ice.

L. Denis,
Montreal, Can.

Detecting a Poor Vacuum.

The vacuum on a compound engine was noticed very low. All stuffing boxes were repacked, suction pipe and pump examined, candle test was made for leaks, but nothing found. By turning steam pressure on exhaust pipe between engine and condenser a number of very small leaks were found; these were too small to be found with candle test, but were in the aggregate sufficient to impair the vacuum. A new length of pipe was the remedy and fixed things O. K.

THE BRITISH ASSOCIATION.

"Celestial Evolution" the Subject of the Second Part of Prof. Darwin's Presidential Address.

Prof. G. H. Darwin, F. R. S., delivered the second part of his presidential address before the British Association for the Advancement of Science on Thursday last, August 31, at Johannesburg, South Africa. In last week's Electricity we printed the first part of the address. The Johannesburg discourse is very interesting. Prof. Darwin declared it not unreasonable to believe that from 500,000,000 to 1,000,000,000 years had elapsed in the evolutionary history of our earth since the birth of the moon. He also gave some details in regard to which, as he had said in his first address, the discovery of radium and its properties had upset the calculations of the scientists.

Discussing the Nebular Hypothesis as suggested by Kant and restated by Laplace, and considering the influence of tidal oscillations, he said the system might be traced back to a time when the day and the month were identical, both being only about four or five of our present hours. The moon at that time must have been only a few thousand miles from the earth's surface—a great contrast with the present distance of 240,000 miles. It might well be argued from this alone that the moon separated from the earth more or less as a single portion of matter at a time immediately antecedent to the initial stage to which she had been traced. If at every moment since the birth of the moon tidal friction had always been at work in such a way as to produce the greatest possible effect, Prof. Darwin said, 60,000,000 years would be consumed in this portion of evolutionary history. The true period must be much greater. Pure geology pointed to some period between 50,000,000 and 1,000,000,000 years, the limit being the more doubtful. Thus the geologists did not find anything which rendered the tidal theory of evolution untenable.

Physicists from a calculation of the total output of the sun's heat, had regarded it necessary that the whole history of the solar system be comprised within 20,000,000 years. He always had believed that the geologists were more nearly correct. Recent marvelous discoveries in physics showed that concentration of matter was not the only source from which the sun might draw its heat. Radium was a substance which was, perhaps, millions of times more powerful than dynamite.

It was estimated that an ounce of radium would contain enough power to raise 10,000 tons a mile above the earth's surface. The energy needed to tow a ship of 12,000 tons for 6,000 sea miles at 15 knots was contained in 22 ounces of radium. The Saxon probably burned 5,000 or 6,000 tons of coal on a voyage approximately the same length,

The earth contains radio-active materials, and it was safe to assume that it forms in some degree a sample of the materials of the solar system. Hence it was almost certain that the sun was radio-active also. This branch of science was yet in its infancy, but already scientists saw how unsafe it was to dogmatize on the potentialities of matter.

Prof. Darwin referred to the inconceivably vast multitude of stars and nebulae revealed by photography. A celestial photograph, he said, looked at first like a dark sheet of paper splashed with whitewash, but further examination showed that there was method in the arrangement of the white spots. It was possible to obtain general ideas as to the succession of events in stellar evolution.

The conviction was forced that the wispy clouds represented the earliest stage of development, the more condensed nebulae a later stage, and the stars themselves the last stage. Change, obviously was in progress everywhere, but scientists were unable even to form conjectures as to the tendency of the evolution. In conclusion, Prof. Darwin said:

"We have seen that it is possible to trace the solar system back to a primitive nebulae with some degree of confidence and that there is reason to believe that the stars in general have originated in the same manner. But such primitive nebulae stand in as much need of explanation as their stellar offspring,

"Thus, even if we grant the exact truth of these theories, the advance toward an explanation of the universe remains miserably slight. Man is but a microscopic being, relatively to astronomical space, and he lives on a puny planet circling round a star of inferior rank. Does it not, then, seem as futile to imagine that he can discover the origin and tendency of the universe as to expect a housefly to instruct us as to the theory of the motions of the planets?

"And yet, so long as he shall last, he will pursue his search, and will, no doubt, discover many wonderful things which are still hidden. We may, indeed, be amazed at all that man has been able to find out, but the immeasurable magnitude of the undiscovered will throughout all time remain to humble his pride. Our children's children will still be gazing and marveling at the starry heavens, but the riddle will never be read."

Convention of Municipal Electricians.

The tenth annual convention of the International Association of Municipal Electricians was held at the Reed House, Erie, Pa., August 23, 24 and 25. A number of interesting papers were read and discussed.

New Haven, Conn., was selected as the place for the next convention.

The following officers were elected: President, Jerry Murphy, Cleveland, O.; vice-presidents, William Crane, Erie, Pa.; H. R. Allensworth, Columbus, O.; B. A. Blakey, Montgomery, Ala.; F. A. Cambridge, Winnipeg, Man.; secretary, E. P. Foster, Corning, N. Y.; treasurer, C. E. Deihl, Harrisburg, Pa. Executive Committee—T. C. O'Hearn, Cambridge, Mass., chairman (inspection); A. S. Hatch, Detroit, Mich. (electric lighting); J. B. Yeakle, Baltimore, Md. (fire alarms); Louis Gascogne, Detroit, Mich. (underground construction); W. M. Petty, Rutherford, N. J. ("Question Box"); James Grant, New Haven, Conn. (membership); W. H. Thompson, Richmond, Va. (associate members); W. Y. Ellet, Elmira, N. Y. (aerial construction). Finance Committee—W. D. Clayborne, J. F. Macdonald and H. C. Bundy.

Proposals Invited.

The Navy Department, through the Bureau of Supplies and Accounts, is inviting sealed proposals until September 19 for furnishing Eastern navy yards with the following supplies: Schedule 108, electric cable; schedule 109, incandescent lamps, circuit breakers, panels, ammeters, dry cells, compound, and electrical supplies; schedule 111, motors and miscellaneous electrical supplies. Blank proposals may be obtained at the Navy Pay Office in New York or of the Bureau in Washington.

On October 3 the Bureau will open bids for furnishing Western navy yards with the following: Schedule 114, electric fixtures; schedule 115, electric fixtures. Blank proposals may be obtained on application to the Bureau.

The Bureau of Supplies and Accounts is inviting sealed proposals until October 3 for furnishing and installing ready for use a complete storage battery installation on board the U. S. steamer Adder at the Norfolk Navy Yard. Applicants for proposals should call for Schedule 121, E. which can be obtained of the Bureau or at the Navy Pay Office in Norfolk, Va.

ELECTRICAL PATENT RECORD.

LETTERS PATENT ISSUED AUGUST 29, 1905.

Electric Railways and Appliances.

798,069. Car-Fender. William W. McClung, Butler, Pa. Filed April 29, 1905.

798,097. Trolley-Stand. Boniface A. Grasberger, Richmond, Va. Filed Dec. 12, 1904.

798,173. Gear-Casing for Electric Railway-Motors. Henry R. Edgecomb, Edgewood Park, Pa., assignor to the Westinghouse Electric & Manufacturing Company. Filed Aug. 17, 1904.

798,227. Electric Railway-Motor. Norman W. Storer, Pittsburg, Pa., assignor to the Westinghouse Electric & Manufacturing Company. Filed Aug. 6, 1904.

798,368. Third-Rail Contact-Shoe. Samuel B. Stewart, Jr., Schenectady, N. Y., assignor to the General Electric Company, Filed May 5, 1904.

798,394. Trolley. Frederic C. Cottrell, Taunton, Mass. Filed April 26, 1905.

798,439. Trolley-Wire Finder. Peter McDonald, Harrison, N. J. Filed Oct. 8, 1903.

Electrical Machinery and Apparatus

798,074. Power-Transmitting and Speed-Controlling Mechanism. Dycke H. Reimers, Chicago, Ill. Filed April 7, 1905.

798,082. Automatic Controller for Electric Circuits. August Sundh, Yonkers, N. Y., assignor to the Otis Elevator Company, East Orange, N. J. Filed Feb. 7, 1903.

798,156. Cooling Apparatus for Electric Generators. Benson Bidwell, Chicago, Ill., assignor to Wilmer S. Snow, same place. Filed Nov. 25, 1904.

798,160-161-162. Control System and Controller for Electric Circuits. Eugene R. Carichoff, East Orange, N. J., assignor to the General Electric Company. Filed Nov. 4, 1903, and June 30, 1904.

798,171. Circuit-Breaker. Harry P. Davis, Pittsburg, Pa., assignor to the Westinghouse Electric & Manufacturing Company. Filed Dec. 26, 1901.

798,222. Ventilating Device for Cores of Electrical Machines. Robert Siegfried, Pittsburg, Pa., assignor to the Westinghouse Electric & Manufacturing Company. Filed Jan. 3, 1905.

798,237. Controller for Alternating-Current Motors. Hermon L. Van Valkenburg, Pittsburg, Pa., assignor to the Westinghouse Electric & Manufacturing Company. Filed Sept. 2, 1904.

798,260. Method of Insulating Electrical Conductors. William A. Bristol, New York City. Filed Dec. 3, 1904.

798,270. Pressure-Operated Electric Switch. Edward H. Dewson, Edgewood Park, Pa., assignor to the Standard Traction Brake Company. Filed Nov. 2, 1901.

798,279. Brush or Collector for Dynamo-Electric Machinery. Josef H. Hallberg, Cincinnati, O. Filed Feb. 15, 1904.

798,290. Electrically-Actuated Reciprocating Tool. Alonzo W. McArthur, Lynn, Mass., and John G. Crawford, Chicago, Ill. Filed Aug. 26, 1901. Renewed Jan. 21, 1905.

798,342-410. System of Motor Control and Controller. George H. Hill, Schenectady, N. Y., assignor to the General Electric Company. Filed Sept. 30, 1903, and May 2, 1904.

798,365. Insulation of Electric Conductors. George H. Rupley, Schenectady, N. Y., assignor to the General Electric Company. Filed Jan 30, 1905.

798,374-375. Electric Switch and Controller. Harold E. White, Schenectady, N. Y., assignor to the General Electric Company. Filed March 22 and April 7, 1904.

798,391. Motor-Driven Machine-Tool. Harold H. Clark, Lynn, Mass., assignor to the General Electric Company. Filed April 9, 1903.

Telephones and Telephone Apparatus

798,123. Telephone-Switchboard. Joseph L. Wright, Cleveland, O. Filed July 28, 1904.

798,252. Antihummer for Telephone-Wires. Benjamin P. Bartlett, Norway, Kan. Filed Oct. 19, 1904.

798,555. Switch or Cut-Out for Telephones and Circuits. Charles Adams-Randall, New York City, Filed Sept. 17, 1904.

798,561. Common-Battery Lock-Out Telephone. Mark P. Boone, Peru, Ind. Filed April 11, 1905.

Miscellaneous.

798,062. Insulated Handle. Arthur E. Hobson and John G. Brown, Meriden, Conn.; said Brown assignor to said Hobson. Filed June 28, 1904.

798,143. Electric Alarm-Clock. Joseph McCarthy, St. Louis, Mo. Filed May 5, 1904.

798,196. Conduit for Electric Wires. Robert W. Lyle, New York City. Filed Feb. 24, 1903.

798,202. Sound-Receiving Means for Submarine Signaling. Josiah B. Millet, Boston; Edward C. Wood, Somerville, and Horace B. Gale, Natick, Mass., assignors to the Submarine Signal Company, of Waterville, Me., and Boston, Mass. Filed Nov. 21, 1903.

798,235. Insulator. William R. Twiggs, Sandusky, O. Filed May 9, 1904.

798,236. Electric Annunciator. Hans Usener, Kiel, Germany. Filed Jan. 4, 1905.

798,300. Electrical Water-Heater. Eli E. Sager, Vancouver, Canada. Filed Feb. 14, 1905.

798,339. Electric Vibrator. Henry J. Heeney, Boston, Mass., assignor to the Holtzer Cabot Electric Company. Filed Nov. 22, 1904.

798,383. Vacuum-Tube. William S. Andrews, Schenectady, N. Y., assignor to the General Electric Company. Filed May 10, 1900.

798,413. Thermostatic Bar. Charles D. Howard, Syracuse, N. Y. Filed Sept. 17, 1904.

798,414. System of Electrical Distribution. Albert S. Hubbard, Greenwich, Conn., assignor to the Gould Storage Battery Company, New York City. Filed June 24, 1903.

798,452. Electrical Signaling System. Joseph P. Sauer, Wheaton, and Samuel E. Johnson, Lombard, Ill. Filed Sept. 19, 1904.

798,481-482-483-484. Electrocapillary Apparatus and Method of Actuating Electrocapillary Apparatus. James T. Armstrong and Axel Orling, London, Eng. Original application filed May 19, 1902. Divided and this application filed Feb. 2, 1904.

THE TELEPHONE WORLD.

Development of Independents.

By a new arrangement of the Independent Telephone Securities Company, which is the holding organization in the recent deals which have brought the Independent telephone interests in Rochester, Syracuse, Rome and Utica, N. Y., in close alliance, the State, it is said, will be divided into three sections for the more complete development of the business.

The new divisions will be called the Rochester division, the Syracuse division and the Utica division. A general manager will supervise the business in each. George R. Fuller, of Rochester, is vice-president and general superintendent of the Independent Telephone Securities Company.

The selection of a general manager for the Independent Telephone Company of Syracuse has not yet been named. A report from Utica says that Charles H. Poole, of that city, has been made general manager of that division, with headquarters in Utica. Under Mr. Poole's management there will be 32 exchanges with over 10,000 telephones. His division will reach from Watertown to Oneonta and from Herkimer to Syracuse.

The Independent Telephone Securities Company has now under construction a local long distance telephone line from Herkimer to Rochester. From Rochester the line will extend west and from Herkimer it will extend to Albany.

Telephones on Limited Trains.

Announcement is made by the passenger department of the New York Central lines that in addition to other features telephone service has been installed on the Twentieth Century Limited and the Lake Shore Limited trains. Passengers can thus communicate with persons at the important cities along the route of these trains without leaving the train. The system is connected at each city with the regular telephone service through the system's telephone exchanges and no charge is made for using the telephones on the train.

Permission for the construction of the York State telephone conduit was lately granted at a meeting of the Binghamton common council. Work on the subway will be begun at once, according to the declared intentions of the company, and the conduits will probably be completed before winter. The matter of a subway has been hanging fire for considerable time. When the subject was first brought up, considerations for a municipal subway were entertained, but the proposition was abandoned almost as soon as the plan was evolved.

The Springfield-New Carlisle, O., Telephone Company has organized with the following officers: President, C. D. Juvenal; vice-president, J. C. Williams; secretary and treasurer, W. W. Morris.

The work of improving the telephone system at Santa Clara, Cal., is almost completed, and the change to the four-party line is a great improvement.

J. B. Pierce will act as general manager of the Independent Telephone Company of Syracuse, N. Y.

School for Telephone Girls.

The first of this month a school for telephone girls was opened in Brooklyn, N. Y., by the New York & New Jersey Telephone Company. In reality the school is an exchange; the only difference being that the wire with which the pupils will operate will not be directly connected with subscribers' telephones. In the school-room will be desk 'phones. At each of these will be stationed a teacher, who will call a pupil up as a regular subscriber would, so the girls will have the same experience they would get on regular wires.

The pupils will be graduated as soon as they prove themselves skilful enough to take charge of wires at regular stations.

Wants Broad Telephone Bids.

There will be competition over the franchise which San Francisco, Cal., is asked to grant for a competing telephone company.

P. Kerr Higgins, A. M., I. E. E., manager of the United States Long Distance Telephone & Telegraph Company and formerly superintendent of the Home Telephone Company of Los Angeles, writes from the southern city to ask the board of supervisors to make the competition for the franchise sufficiently broad to permit of the installation of the "most modern apparatus," whether it be "manual or automatic."

Mr. Higgins says that he represents an Eastern syndicate with resources of $5,000,000. He is willing to give the names of his backers any time in confidence, and suggests that the supervisors investigate the merits of his telephone at the expense of the successful bidder for the franchise.

An Independent telephone line is being constructed by W. A. Chamberlain, of Constable, N. Y., which already has a considerable patronage. Mr. Chamberlain began the work on his line a year or two ago, confining his operations to the town of Constable. This season he has extended his system, now being at work on an extension to the village of Huntingdon, going by way of Lee's Corners and the Irish Ridge. He has received promises of a liberal patronage in Huntingdon, as the rate is only $12 per year.

The annual meeting of the Jackson County Telephone Company was held at Elkville, Ill., a short time ago. A special meeting will be held November 14 for the purpose of placing a motion for moving the main office from Elkville, to Murphysboro. The following officers were chosen: President, C. A. Schwartz, of Elkville; vice-president, R. H. Blacklock, Vergennes; secretary, John D. Hayes, Elkville; treasurer, Samuel Schwartz, Elkville.

The Valley Telephone & Telegraph Company of Green Bay, Wis., has issued an amendment changing its name to the Fox River Valley Telephone & Telegraph Company, and increasing its capital from $250,000 to $350,000. W. E. Fairchild president, and Joseph P. Hoepfel secretary.

The Southwestern Telegraph & Telephone Company is preparing to build a line from Nettleton to Wynne, Ark.

Independent Companies Connected.

The Ellis County Independent Telephone Company and the Fort Worth Independent Telephone Company of Texas are now in direct communication with each other. Arrangements have been made to establish a long distance service between these places. The completion of this line gives Waxahachie connection with Forth Worth, Gainesville, Sherman and other North Texas points.

The Hayes Valley Improvement Club of San Francisco, Cal., has adopted strong resolutions in favor of the grant of a franchise to the Home Telephone Company by the board of supervisors. The fact is recited in the preamble of the resolutions that the company has agreed to spend $2,000,000 in 12 months, $3,000,000 in two years, and $4,000,000 in three years, thus giving employment to between 2,000 and 3,000 men, and that the company has also undertaken to pay 2 per cent. of its gross receipts to the city. The resolutions pronounce firmly against monopolies, and the club "urgently requests that the honorable board of supervisors grants the application for a franchise to the Home Telephone Company." Reference is made to the imperfections and anoyances of the present telephone system.

The appraisers appointed to place valuations on the personal estate left by the late Simon P. Sheerin, have filed their report with the Probate Commissioners in Indianapolis, Ind., showing an aggregate value of the estate of $298,877.41. The property consists of certificates of stock in the various telephone companies, principally local corporations. The inventory follows: Indianapolis Telephone Company, 1,196 shares, $59,800; preferred stock, same company, 299 shares, $22,425; New Telephone Company, 421 shares, $33,686; New Long Distance Telephone Company, 1,111 shares, $49,995; Citizens' Telephone Company, Columbus, Ind., 611 shares, $18,330; thirty-one bonds, New Telephone Company, $24,800; 33 bonds, New Long Distance Telephone Company of Indianapolis, $28,050; 59 bonds, Citizens' Company of Columbus, Ind., $22,125. Cash in Fletcher National Bank, $8,410, cash in Capital National Bank, $4,915.

Fred B. Jones, superintendent of construction of the Home Independent Telephone Company at Salt Lake City, Utah, has completed a trip through Carbon and Emery Counties with a view of connecting up this section with Sanpete County, and the main line eventually at Salt Lake City. It is said that the Price and Emery County line from Price to Ferron is likely to go to the Home. Whether disposed of or not, it is the intention to extend the present line to the town of Emery and to put in drop switchboards all along the route. The present company also contemplates further improvements and extensions.

Incorporation papers of the Pioneer Telephone Company, which proposes to construct a line serving all the towns of Erie County, N. Y., were lately filed with the county clerk. The capital stock is fixed at $10,000. The directors are C. D. Cramer, O. A. Martin, William Bald, E. Weinanger, H. C. Britting, F. C. Goold and F. W. Schaad. The headquarters are at Clarence.

GENERAL ELECTRICAL NEWS.

LIGHTING.

Albany, N. Y.—The Suffolk County Lighting Company has been formed to deal in gas and electricity for lighting the villages of Suffolk and Nassau Counties. Its capital stock is $50,000, and the directors are George MacDonald, C. A. Hickey and W. Morgan, of New York City.

Columbia, Mo.—This city has voted $10,000 in bonds for improving the municipal electric light and water plants. E. D. Podrick, city engineer.

Concord, Conn.—This city is soon to have practically a new electric light plant.

Greens Farms, Conn.—Superintendent F. B. Hubbell is making a canvass of this place in relation to extending the electric lights here. He says that he finds nearly everyone in favor of the lights and ready and willing to have them put in.

Greenwood, Wis.—The proposition to bond this city for electric lighting and waterworks was carried.

Herington, Kan.—Charles F. Gustafson, of the Topeka plumbing firm of Conklin & Gustafson, has secured a franchise to furnish water, electric light and power to this city.

Hyattsville, Md.—The prospects for the installation of an electric lighting system here, to take the place of the present plant, are exceedingly bright. It is proposed to have the citizens subscribe to a fund to install the plant and have the town create a sinking fund to reimburse the subscribers in the course of four or five years. By this means the town will eventually own the plant.

Kankakee, Ill.—W. J. Brock, W. P. Dixon, Benjamin B. Sammons and Americus E. Melville have been granted a franchise to construct and maintain poles, wires, etc., for lighting, power and heating purposes within the city limits.

Lansing, Kan.—Through the increase in business which necessitates the use of electric lights the merchants of this place have decided to provide themselves with an electric plant.

Midland, Md.—William Borderick, A. A. Davis, Henry Ward and others propose organizing a company to install an electric light plant.

Morrison, Ill.—The Morrison Electric Lighting Company has increased its capital stock from $20,000 to $60,000.

Newport, Ky.—An election is to be held to vote on the question of issuing $50,000 of electric light plant bonds.

Norwalk, Conn.—By a vote of 128 to 42 a special city meeting passed a resolution instructing Mayor Buxton to appoint a committee of three to consider the advisability and to formulate a method of procedure in establishing a municipal electric light plant.

Oliver Springs, Tenn.—This place is soon to have an electric light plant. F. C. and W. H. Sienknecht are very much interested in the scheme.

Paragould, Ark.—This city is arranging to install an electric lighting plant and construct sewers. For information address Jason Light, secretary of the board of aldermen.

Quincy, Fla.—This city has proposed the issuance of $5,000 in bonds for improvement of waterworks and electric light plant.

Richwood, O.—The Richwood electric light plant was lately sold by Edward A. Schambs, of this place, and Col. C. W. Fisher, of Bucyrus, to a local company recently organized for that purpose.

Salt Lake City, Utah.—The Progress Company has been granted a franchise by the county commissioners to string electric light wires from Murray to Bingham Junction for the purpose of furnishing electric lights to the latter place.

Sioux Falls, S. D.—The Queen City Electric Light & Power Company has been incorporated with a capital stock of $300,000 by H. J. Hanford, of Chicago, Pitt Curtis, of Norwalk, O., and A. Huntington, and U. S. G. Cherry, of this city.

Toledo, O.—Charles S. Ashley, president of the Central Heating & Lighting Company, announces that extensive improvements are about to be made in the electric lighting plant.

West Branch, Mich.—W. W. Vaughn sold the Rifle River Electric Light & Power Company to the Eddy Company of this place, instead of having purchased it, as was stated in the issue of ELECTRICITY for August 23. Mr. Vaughn is now constructing a plant on the Sturgeon River to light several villages along the Michigan Central Railroad.

Westfield, Wis.—The vote to establish an electric light plant in this village was lately carried.

STREET RAILWAYS.

Albany, N. Y.—The Elmira, Corning & Waverly Railway of Elmira has been incorporated with a capital of $2,500,000 to construct an electric road 37 miles long. The directors are Senator William J. Tully, of Corning; G. Tracy Rogers, of Binghamton; A. N. Brodhead and Arthur C. Wade, of Jamestown; Joseph A. Power and James H. Caldwell, of Troy; Thomas O'Connor, of Waterford; Frederick E. Hawkes and William L. Watrous, of Waverly; George McCann and A. Lee Smith, of Elmira.

Alliance, O.—The promoters of the new electric line from this city to Akron have decided to ask for a charter under the name of the Alliance-Akron-Cleveland Company with a capital stock of $50,000. Hugh Bleakly is the organizer.

Bucyrus, O.—An enthusiastic meeting was lately held at New Washington for the purpose of considering the building of the Bucyrus, New Washington and Chicago Electric Line, which it is proposed to run from Chicago Junction through New Washington and Sulphur Springs to this city.

Cedarville, N. Y.—A meeting was held recently for the purpose of granting a franchise in this village to the new proposed trolley company.

Cincinnati, O.—A great trolley system from here to Pittsburg is planned for the near future.

Davis, I. T.—The city council in an extra session granted a franchise through the streets to the Oklahoma City, Lexington & Sulphur Springs Electric Railway Company.

Greenwood, Miss.—Interest is being revived in the proposed electric railway for this city. The Greenwood Electric Railway Company will begin the construction of the road before its franchise expires.

Hoopeston, Ill.—The Interstate Traction Company has increased its capital from $100,000 to $500,000.

Jefferson City, Mo.—The McKinley Syndicate is about to build an electric line from Carthage to this city.

Long Beach, N. Y.—Trolley connections between this resort and Point Lookout, its eastern extremity, is confidently expected to be a reality next season.

Marion, O.—Another electric line is being projected to this city.

Monett, Mo.—The city council lately passed an ordinance granting a franchise to C. W. Copeland and others, for the purpose of constructing and operating an electric car line over the principal streets of this city.

Peru, Ind.—The directors of the Peru-Winona electric line have decided to start work immediately on the new road. Captain Duke is interested.

Rochester, N. Y.—Plans are now being discussed for a belt trolley line to take in some of the more important towns south of this city and along the river. Isaac W. Salyerds, of Scottsville, is interested in the project.

Springfield, Ill.—Ground was lately broken for the new electric interurban railway to be built between this city and Petersburg.—The Secretary of State has licensed the St. Louis, Vandalia, Terre Haute & Eastern Traction Company, capitalized at $1,000,000, incorporated by B. Chase, of Decatur, and Charles W. Mills, of Chicago.

Syracuse, N. Y.—The Auburn & Syracuse Electric Railroad Company contemplates increasing its capital stock from $1,500,000 to $2,000,000.

Yorkville, Ill.—An electric line is to be built from here to Morris.

POWER PLANTS.

Fayetteville, Tenn.—A number of local capitalists are interested in harnessing Elk River so as to utilize the power which has been wasted for years. They propose to place a dam across the river near Pearl City, a few miles below this place, and will erect a $60,000 cotton mill. The Elk Cotton Mills of this place propose to float the bonds.

Harrisburg, Pa.—The Pennsylvania Traction Company will erect a new power plant to cost from $200,000 to $250,000.

Huntingdon, Pa.—The Juniata Electric Company, a new corporation, contemplates spending $750,000 in building a dam across the Juniata west of this place, and erecting a great power plant here for the purpose of furnishing electric light for all the manufactories of Altoona, Tyrone, Huntingdon and intermediate towns in the Juniata Valley.

Joliet, Ill.—A power plant is to be erected here by the Illinois Steel Company of Chicago, to cost $1,000,000.

Marinette, Wis.—The Penn Iron Mining Company has started work on a power plant at the mouth of the Sturgeon River at the junction with the Menominee. The dam will be finished this year. Nearly 4,000 hp. will be generated and will be used to operate the machinery in the mines of the company at Norway, Mich.

NOTES FOR INVESTORS.

Latest quotations for copper are: Electrolytic, 16½@16¾c.; Lake 16½@16¾c.; casting, 16¼@16⅜c.

The quarterly rental of 1¾ per cent. on New York Metropolitan Street Railway stock will be paid October 15.

The annual report of the Brooklyn Rapid Transit Company is ready for submission to the members of the executive committee, and will show, it is said, the greatest earning power ever displayed by the system.

The Chicago Electric Traction Company, which is now in the hands of a receiver, is to be taken out of litigation and absorbed by the Chicago & Southern Traction Company, a new Indiana corporation, which is capitalized for $2,000,000.

A point that seems not to have been made public before, in connection with the Keystone Telephone Company's financing, is that the preferred stock may be retired, under certain conditions, and that $2,500,000 of the new bonds are reserved for this purpose.

There has been a shrinkage of over $45,000,000 in the selling prices of copper shares between the high prices of this year and the low prices of Saturday. There has been no reduction in the commercial price of copper, nor are there any immediate signs of any, and yet copper stocks have declined materially.

A trust mortgage of $5,000,000 has been given by the Grand Rapids-Muskegon Water Power Electric Company to the Michigan Trust Company of Grand Rapids to secure an issue of bonds at 5 per cent. interest, the bonds to be issued in denominations of $100 each, and the principal and interest to be paid in gold.

President Mellen, of the New York, New Haven & Hartford Railroad Company, has made a voluntary increase in the wages of motormen and conductors on the Consolidated Railway system, which is owned by that company. The increase is one cent per hour and the new scale went into effect on Monday.

A director of the Philadelphia Electric Company in discussing the electric lighting situation in his city repeats that any published lists of other cities where lighting may apparently be done at a cheaper figure are incomplete unless they include such information as costs of coal, free lights, all-night schedule, etc. As a general proposition, he contends, it costs more for lighting in the larger cities than in the smaller ones.

Owing to the change in the termination of the fiscal year of the Allis-Chalmers Company, from April 30 to June 30, no exact comparison may be made between the annual report issued on Saturday last and the preceding report. The report for the fiscal year ended June 30 last states that the capital stock remains the same as in the previous year, as follows: Authorized common stock, $25,000,000; authorized preferred stock, $25,000,000; total amount authorized $50,000,000. The outstanding share capital is as follows: Common stock, $19,820,000; preferred stock, $16,150,000; total amount outstanding, $35,970,000. The net profits for the fiscal period ended June 30 last, after deducting all expense of manufacturing and selling and after making provision for the depreciation of buildings and machinery and for possible bad debts, amounted to $68,982, as compared with $952,624 in the fiscal year ended April 30, 1904. In the latter year dividends of 5¼ per cent. were paid upon the preferred stock, amounting to $853,125, leaving a surplus of $99,499.

NORTON SWITCHBOARD INSTRUMENTS.

Style "C" in Ranges:

0 to 5 volts.
0 to 750 volts.
0 to 10 amperes.
0 to 1500 amperes.

Dead Beat and made for either Back or Front Connections.

The Norton Electrical Instrument Company,

Main Office and Factory, Railroad Avenue, MANCHESTER, CONN.

ESTABLISHED 1857.

The Wallace Barnes Company,

BRISTOL, CONN., U. S. A.,

Manufacturers of SMALL SPRINGS of every description. Dealers in WIRE and COLD ROLLED STEEL full of life and even temper.

Catalogue and stock sheet mailed upon application.

"Manross" Hair Springs

For Electric Indicating and Recording Gauges, Steam Gauges, etc.

Largest Manufacturer of Hair Springs in the United States.

F N. MANROSS, Forestville, Conn.

Write To-day for Our Prices to Dealers.

Let us help you increase your revenue.— We want a representative in each district.

EDITORIAL NOTES.

Elementary Considerations. Fuses are simply pieces of metal alloy in the form of bands or wire, which connect the circuit with the source of power. It seems as though the fuse question would be apparent from any standpoint whatsoever. At any rate, certain elementary considerations can be touched upon for the purpose of discovering why such doubts, as are sometimes expressed with regard to their operation, have a good foundation.

A metal alloy of this character is only made up for the purpose of obtaining volatilization when a certain temperature is reached. For the further success in accomplishing this purpose, fuses are made to melt or volatilize with a certain current. This is where the difficulty occurs. Any piece of wire is subject to the influence of temperature under such peculiar conditions. A piece of fuse wire, melting at its correct amperage, would not perform its function properly in a region exposed to Arctic cold. On the other hand, within the Torrid belt, the abnormal heat would make it melt all the sooner. The question, therefore, of why fuse wire betrays such irregularities. is best answered by the remark that the irregularities, if any, are the result of periods of high and low temperature. A fuse up near the ceiling is affected by a blanket of hot air. A fuse further down, or in a cold hall, is really one capable of standing a heavier current. Although the point at which a fuse blows is predetermined, it is not to be forgotten that this point is only correct for a certain external temperature. If a fuse is erratic, in that it cannot be depended upon, then the metal is at fault. But until this is ascertained, the heat and cold are reasonable answers to all such questions.

Reasons for Successful Manufacturing. The intertwining of shop methods with business rules has resulted in a sweeping reform in processes of manufacture. The difference between American and European systems in this respect has excited wonder and comment. From amidst all the possibilities pertaining to the complications of the manufacturing art, the genuinely thorough and practical scheme of operation has been selected and adopted in all large shops and factories of the United States. One of the best reasons why successful manufacturing has been the keynote of our commercial progress is because, either through knowledge or instinct, the organizers of large manufacturing plants have developed remarkable methods—the only methods—by which cheapness and dispatch can be secured. In the development of the electrical industry events occurring within our own time have left their traces upon the present processes in vogue. In the beginning the manufacture of electrical appliances belonged to the sphere of work controlled by the maker of physical and laboratory devices. The dynamos to be obtained were hand magnetos, the motors merely toys, and the other class of apparatus only that commonly accepted by lecturers and students as serviceable for purposes of demonstration. Even in the creation of these appliances a rather haphazard method of manufacture prevailed. The man of the shop, or rather the most valuable men of the shop, were those possessing a peculiar skill in obtaining results from the devices they made. The ruling power was an arbitrary one, and the actual operation of a magneto or motor, supposed in a sense to result from a certain knack in the fingers of the builders, was therefore considered as resulting from an unusual exhibition of personal acumen. In other words, shop methods of the old school were cases of where the skill appeared only in spots. A few were the possessors of this rare qualification, and they dominated, as far as the rate of production was concerned, in all cases where this peculiar system prevailed. Even to-day, in some fields of work, where individual skill is the sole asset, the art is handed down from father to son for generations. There is no publicity given either to the art or method.

The elements from which spring such remarkable abilities are, as far as the owners are concerned, hidden from analysis. General progress on a large scale for this reason could not take place. Its appearance occurred only in certain directions. This was particularly true in the manufacture of electrical apparatus and machinery. At one time the art of coil building was possessed by very few. At another time the operation as well as the construction of a dynamo was shrouded in mystery. Lamp making belonged to a chosen few both in its methods and testing. But individual skill and knowledge have been systematized, written up, and taken out of the shop for others to know. As a result, the shop expanded, and with this expansion came the crystallization of certain principles.

Cheap and successful manufacturing is a success, because thousands now possess the skill at one time only in the hands of a few. Machines do the thinking and acting in turning out products with which a million men would unsuccessfully compete. This is one of the best reasons why America leads in the manufacture of electrical appliances.

* * *

Politics and Municipal Ownership.

There seems to be a desire on the part of the "bosses" of the leading political parties in Greater New York to "make a play" for municipal ownership at the November elections. The "Wall Street Summary" says that the statesmen (?) who are advancing the general proposition are dragging it before the public by the horns and with all the strength they can exert, for, as a matter of fact, there has been no general or insistent demand upon the part of citizens of New York for any such radical change. Practically the only city of the first importance in the United States that has considered this question seriously is Chicago, and even there the agitation in favor of it is in such an inchoate state that even the most vigorous advocates of it must be seriously discouraged. The municipal ownership proposition obviously is one of such great importance to everyone, even the humblest member of the community, that we should not be asked to pass upon it until after a protracted and exhaustive examination and discussion. At the moment, if we read the temper of our fellow-citizens correctly, they are pretty well satisfied with the existing order of things. It is not conceivable that the city could manage or operate our systems of local transit any better than they are being operated by private enterprises, or could supply the public with transportation at lower rates than rule at present. The same is true of gas and electric light service, the prices for both of which have been declining steadily for some time past, yet without any impairment of the quality and quantity of the products furnished to the public. Anyone who has ever come in contact with the rank and file of the city officeholders must shudder to think of the treatment he would receive if all of our street car employes were appointees of the party in power, no matter which party it might be, or of having to depend upon the same class of employes in dealing with their requirements in other respects which are now supplied by privately owned corporations. Is it inconceivable that an insolent or incapable street car conductor or motorman would, with his political pull, receive the same treatment from a superior municipal officer that he now gets from corporations that are intent upon raising the efficiency and courteousness of their employes to the highest possible degree.

UNDER THE SEARCHLIGHT.

Notes and Comments on Various Topics.

President Blood of the National Electric Light Association has appointed the following gentlemen as the committee on standard rules for electrical construction and operation: Ernest H. Davis, chairman; Capt. William Brophy, Louis A. Ferguson, Alex. Dow and Samuel Scovil.

A cable dispatch from St. Petersburg, September 9, says that an imperial ordinance will shortly be published providing for the abolition of retaliatory duties on machinery from America.

The eighth general meeting of the American Electrochemical Society will be held at South Bethlehem, Pa., Sept. 18, 19 and 20. The first session, next Monday, will commence at 3 P.M., while the sessions on Tuesday and Wednesday will open at 9 A.M. The meetings will be held in the lecture room of the Physical Laboratory of Lehigh University.

Twenty-four electric traction companies are now in operation in Indiana with a total of 913 miles. All of those railways have been built in the last ten years.

The electric light plant of Osaka, Japan, a city with 800,000 population, has been entirely equipped with American electrical apparatus.

The wireless telegraph station on Anastasia Island off the coast of Florida is now complete, and was officially placed in commission a short time ago.

Since the advent of the electric sign in Boston the amount of electric current consumed there has had such a notable yearly increase that its figures are really astonishing. Now that the figures are compiled Boston claims to lead the world in consumption of electric current per capita.

The mule tramway lines in Para, Brazil, are to be electrified.

The Western experiment of trolley sleeping cars has, it is said, enlightened certain capitalists interested in the development of a through trolley line from New York to Boston. It is stated that when the links between the various trolley lines now in use between this city and Boston have been connected that sleeping cars with all the conveniences of a regulation Pullman car at about half the price may be looked for.

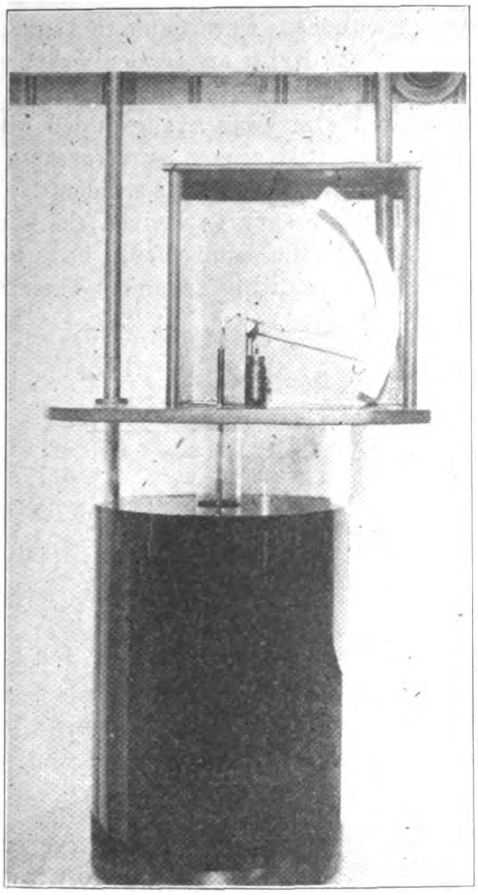
In a short time tests will be made to establish direct wireless telegraphy between Washington, D. C., and the navy yard at Brooklyn, N. Y. Hitherto messages have been sent between the two places by relays, but it is thought this can be improved upon.

The construction of an electrical high-speed railway between Cassel and Cologne, Germany, is suggested by Mr. Frankel, a Breslau engineer, with a view to testing on a large scale the possibilities of electrical long-distance railways. Assuming a maximum speed of 160 km. per hour, corresponding with a commercial speed of about 125 km. per hour, the electrified Cologne-Cassel line (180 km.) could be traversed in 1 hour and 27 minutes, while 5 hours are required to cover the present line of 275 km. length passing through Elberfeld.

A NEW EUROPEAN HIGH POTENTIAL ELECTROSTATIC VOLTMETER.

BY FRANK C. PERKINS.

A most interesting electrostatic volt meter has recently been designed by Prof. August Grau, of Vienna, Austria, for measuring potentials up to 90,000 volts. This electrostatic instrument, noted in the accompanying illustration and drawing, consists of a glass jar filled with oil, which is used as a dielectric, with a glass plate resting on three supports at the bottom. A metallic cylinder is supported on this plate, forming one plate of the voltmeter, the connections being made to this cylinder by a wire placed in a porcelain tube passing through the oil. A smaller cylinder is utilized concentric with the larger cylinder suspended by a copper wire surrounded by a glass tube. A thin plate is attached to the lower end of this small cylinder with a lead weight under the plate. A glass rod is utilized projecting from the weight to hold the movable system, which is concentric with the large fixed cylinder. As will be noted by the illustration there is a fine wire passing over a pulley connected with a counterweight, the pulley having the pointer attached to it and multiplying the motion of the cylinder, which moves up and down, the proper reading being indicated on the scale shown in the drawing. The other side of the high-potential circuit is connected to the movable system, the conductor passing to the pulley through a porcelain tube, while in order to damp the motion of the movable cylinder a plate is fastened to the lower end of the same. There are three friction rollers fastened to the glass plate which hold the glass rod in position, the latter passing through an opening in the plate. This electrostatic voltmeter is constructed for 90,000 volts and cannot be utilized at higher pressures, as in so doing there would be a discharge through the oil between the plates.



An Electrostatic Voltmeter.

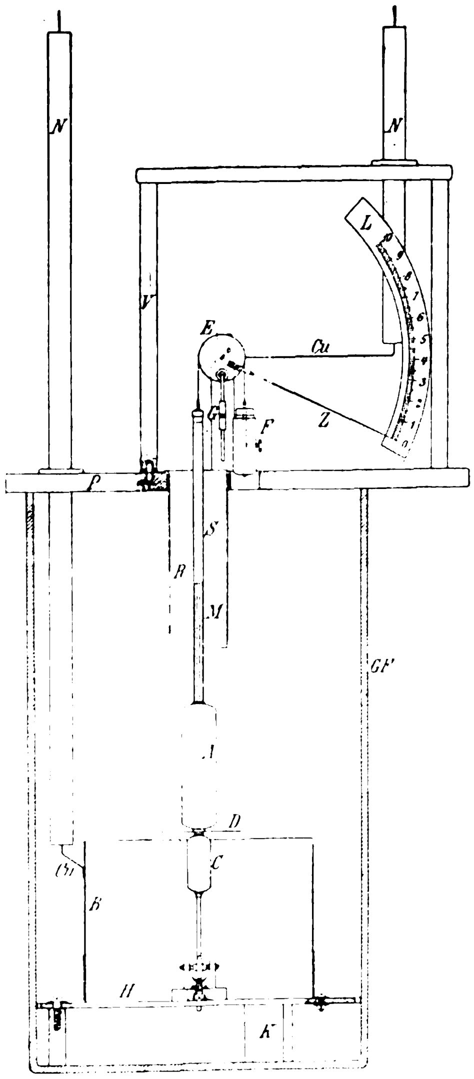


Diagram of an Electrostatic Voltmeter.

There has been considerable difficulty in measuring high pressures, many types of instruments being utilized which give satisfactory results up to 25,000 volts. It is claimed that accurate readings are obtained by using a transformer in the high voltage line if all leakage is prevented, and if non-inductive resistances are employed, which are reliable, they may be utilized to advantage as multipliers. Other high tension instruments have been designed with condensers in series, employed as multipliers; but difficulties have been encountered due to various frequencies employed, it being hard to make an instrument with the same dielectric coefficient as the condenser.

The voltmeter shown in the illustration has given excellent results and has a capacity of about .0001 microfarad. The large cylinder is 140 mms. high and 200 mms. in diameter, while the smaller cylinder, which is movable as seen in the illustration and drawing in the center, is 110 mms. long and 30 mms. in diameter, while 200 grams is the weight of the lead attached to the same. There should be a wide field of usefulness for the electrostatic voltmeter in measuring the pressures of high tension power transmission lines and apparatus.

ELECTRICITY AND PLANT GROWTH.

The "Electrician," London, publishes some statistics on the effect of electricity on plant growth, as given by a correspondent in "The Fruit Grower and Market Gardener," that are to say the least very interesting. The experiments in question were made at Bristol, England, the method employed being that advocated by Prof. Lemstrom. The communication is as follows:

You will see that the hopeful views I expressed in April have in the main been justified. Taking the experiments where the crop has already been secured, the results have been:

Cucumbers, 17 per cent. increase; strawberries (five-year plants), 36 per cent. increase; strawberries (first-year plants), 80 per cent. increase; broad beans, 15 per cent. decrease but an acceleration of about five days; cabbages, acceleration of about 10 days. . . . On May 8 the spot disease appeared in the cucumber houses, and attacked the unelectrified worse than the electrified houses, and how much of the increase is due to the direct influence of the electricity and how much to the lesser virulence of the disease in the treated houses must remain an open question, to which further experience alone can give the answer. The increase in either case remains to the credit of the electric treatment, for it is difficult to avoid the conclusion that it was a preventative (though not an absolute one), as during a week in which the influence machine was not at work the disease made headway in the electrically-treated houses.

It is an interesting fact, and bears on the question, that we have indications that electricity also operates against macrosporium tomato, but the data are as yet insufficient to let one speak positively.

The increase in the strawberries is remarkable (though Lemstrom records even greater increases), and as far as I know there is no factor other than the use of electricity which will explain it. A far greater number of runners have been produced from the electrified plots. Current was first put on March 24. All plants flowered together, and there was no marked acceleration of the ripening of the berries. Whether the increased weight be due to a larger number or a greater size of the berries per plant I cannot say. I am inclined to think both causes operated, the latter more than the former. The total area of the experimental and control plots amounted to rather over 1,000 square yards.

The result from the beans confirms Prof. Lemstrom's experiment. There was apparently an increase in the tops, but these were not weighed. The cabbages were cut from the electrified half about a week to a fortnight before the non-electrified, and, on the whole, hearted better. It must be borne in mind that these were spring cabbages, and that the same result need not necessarily follow with summer cabbages when the ground is drier, and also that as the current was only applied for about half the growing life of the plants, and then only about four hours daily, a greater acceleration might have followed a larger use of the current.

The tomato crop is not, at the time of writing, finished, but is far enough advanced to show that the current has exercised no appreciable influence. In the earlier stages a quicker growth was observed, but the advantage gained was not maintained. As the tomatoes are grown in cucumber houses, there is very little room to run the distributing wires, which have to be close against the roof, and possibly the greater portion of the current gets to earth via the roof and house wires without doing useful work. This is a point I hope to investigate when opportunity offers. I have already mentioned that there is some evidence of disease being checked. This, it may be worth while to point out, is probably caused by the various gases (ozone, nitrous acid, etc.), generated by the electric discharge operating by keeping the air purer and perhaps sterilizing the pores of the disease.

The electrical part of the installation has throughout given little trouble, and is easy to manage, some care in keeping the wires clear of cobwebs, old tendrils, shoots, etc., being all that is wanted.

Since March 7 the influence machine has been run 1,268 hours, on 108 days out of a possible 136, or an average of 9.3 hours daily. Before May 20 the machine was running in the daytime and evening, since then chiefly at night.

WIRING FOR LAMPS AND MOTORS—MEETING AN EMERGENCY.

BY W. H. WAKEMAN.

ARTICLE II.

Again referring to Fig. 2 the positive wire 12 is spliced, thus making both upper and lower bus bars positive, while the central bar is negative. Current from these bus bars supply two three-wire lighting systems, as shown at the lower part of the figure. Each of them supply three junction boxes, from which two-wire circuits are laid in the usual way. (See Fig. 1.)

These six boxes use about all the current that the dynamo should generate, but the wires, 14, 15 and 16, were added afterward, carrying nearly as many lamps as both of the lower circuits, with the understanding that not all of these lamps would be required at any one time. There came a time, however (as I expected), when they were all wanted at once for a few hours only.

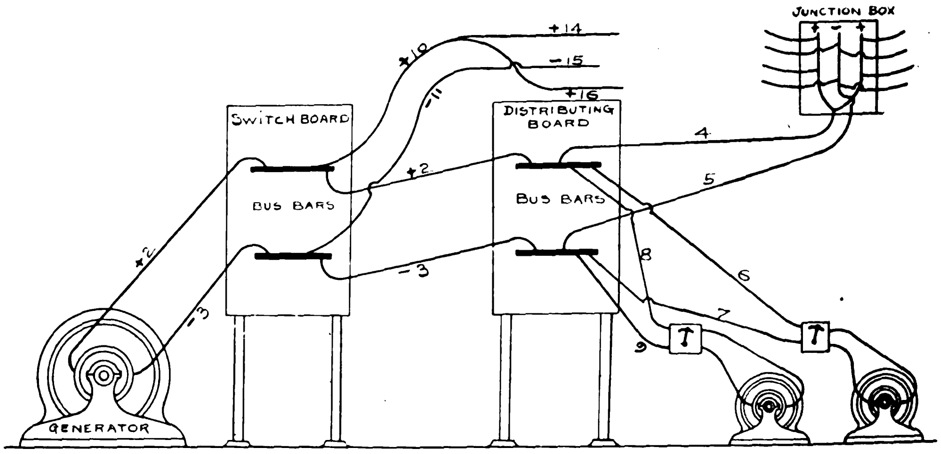

FIG. 3.

Now the generator was not loaded to its full capacity, therefore if some lamps could be taken off from the dynamo lines and connected to the generator the problem would be solved, but something had to be done quickly or important plans on the part of others would be frustrated.

The wires 14 and 16 were spliced and connected to 10, as shown in Fig. 3. Wires 15 and 11 were spliced, thus relieving the dynamo, as illustrated in Fig. 4, which disposed of all trouble so far as this part of the plant is concerned.

The next point to be settled was whether the generator could carry the load called for by the arrangement of wires shown in Fig. 3. When first put on it was well within the limits of its capacity, but as lamps, wires and motors began to slowly increase in temperature, thus offering more resistance, the ammeter pointer indicated but 10 amperes less than the limit, showing that something must be done quickly. The limit in this case was determined by a circuit breaker, which was something more than an ornament, as it would break connections when the proper time came for it to operate.

In other places I have had charge of engines in plants which supplied current for street lights, stores and for private use, where it would cause much annoyance and trouble if the supply should be shut off for any reason, but it seems as if the consequences were liable to be much worse where lights are suddenly shut off from public buildings in which several floors and stairways are crowded with visitors, as it is almost sure to cause a panic, resulting in serious accidents.

It was necessary to reduce the load, but none of the lamps could be turned off without causing trouble. These 20 hp. motors are used to drive large fans for ventilating purposes, therefore it was practical to reduce their speed, which of course would take less power.

There is a right and wrong way to do this, for if the starting lever is thrown back carefully, one notch at a time, the change will hardly be noticed by people who are using the lights. (See Fig. 5.)

On the other hand, if it is thrown back quickly, four or five notches, the lights will show it at once, and as every such imperfection in service is charged to the engineer by the general public, whether it belongs to him or not, it is a good idea to watch these details and have as few explanations to make as possible.

There is at least one other reason for handling all such matters with care, and a very important one, too, as follows. Any sudden change in the call for current may lower the voltage on over-compounded generators and dynamos, and as large fans or other machinery driven by motors will accumulate much momentum one or more of them may act as a prime mover for its particular driver for a short time, but it may be long enough to actually drive the motor, thus converting it into a generator and reversing the polarity—drawing a heavy charge from the main generator—which will throw out the circuit breaker, leaving all rooms and halls in darkness.

In this case the speed of motors was reduced without trouble, thus reducing the amperage until it was within safe limits, even when a higher temperature had increased the resistance.

If the voltage is reduced the amperage will also be less even with the same number of lamps and motors in use, but where this method is tried it must be done very cautiously as otherwise the polarity will be reversed as previously described. This refers to a system including lamps and induction motors. It may apply to other systems, but I know it does to this.

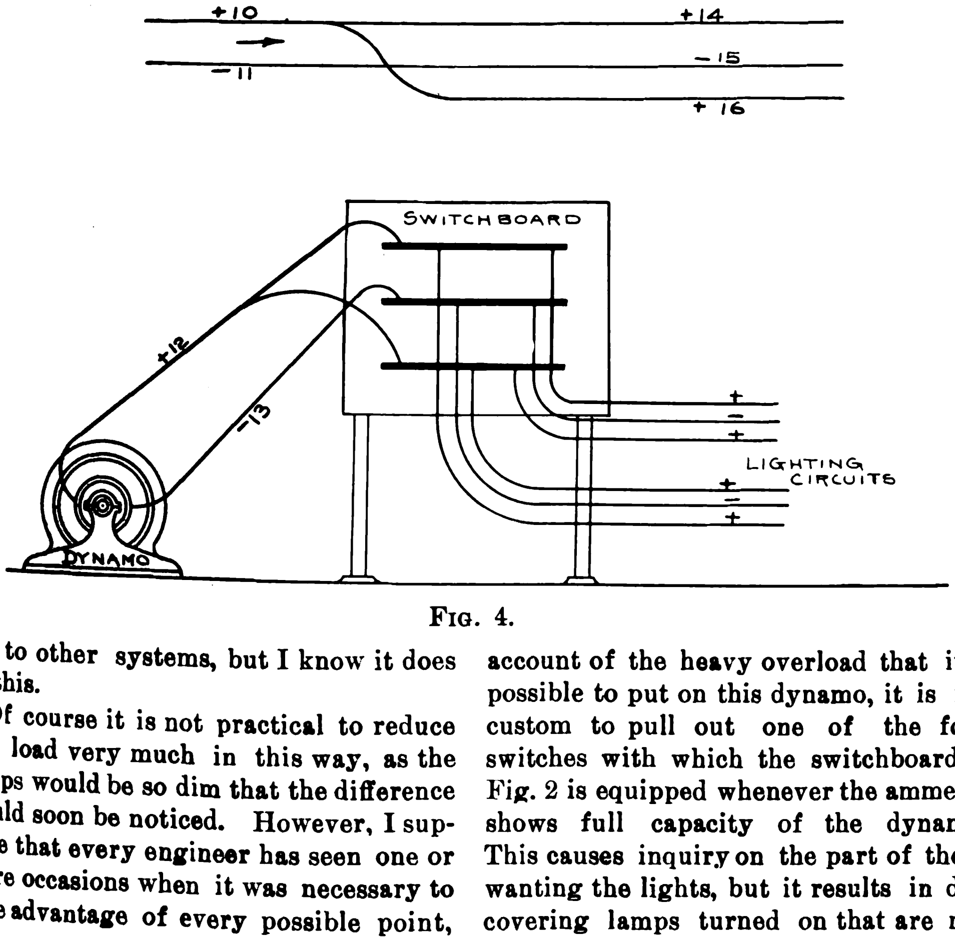

FIG. 4.

Of course it is not practical to reduce the load very much in this way, as the lamps would be so dim that the difference would soon be noticed. However, I suppose that every engineer has seen one or more occasions when it was necessary to take advantage of every possible point, either great or small, in order to prevent shutting down, consequently every suggestion along this line will be useful sooner or later.

Nearly every advertisement of a generator or motor states that it will stand an overload of 100 per cent. for a short time, and that it will carry from 25 to 50 per cent. overload for several hours. The proviso that it will carry 100 per cent. "for a short time" should be taken literally for the time must be very short. Perhaps it will carry 25 or even 50 per cent. for an hour or two, but I have never met even an enthusiastic salesman who claimed that it would do the machine any good, while many engineers and electricians testify to the contrary.

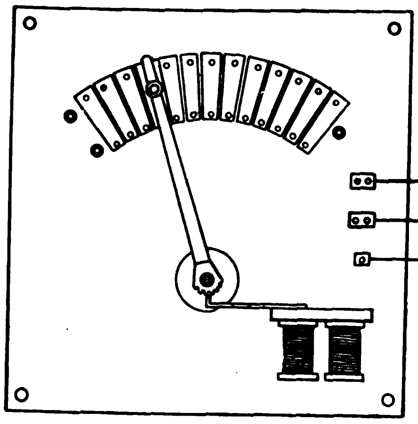

FIG. 5.

As the change made in this system of wiring was only for temporary use, it was replaced as originally shown. On account of the heavy overload that it is possible to put on this dynamo, it is my custom to pull out one of the four switches with which the switchboard in Fig. 2 is equipped whenever the ammeter shows full capacity of the dynamo. This causes inquiry on the part of those wanting the lights, but it results in discovering lamps turned on that are not needed, and when these are turned off the remainder does not constitute an overload. I consider this much better than to heat the dynamo until it must be stopped.

In these articles the term "generator" and "dynamo" are used to describe machines that supply the same kind of current, which at times is used for exactly the same purpose. This is done in order to distinguish them in several descriptions necessary to a full understanding of the matter.

In common practice a machine tha supplies current for driving stationary motors, or those located on street cars, is called a generator, while one that furnishes current for incandescent or arc lamps, or perhaps for both, is called a dynamo. Both of these types may be divided into several kinds according to the nature of current generated, therefore when speaking or writing of an electric machine it is well to state briefly what it is intended to do.

Illustrating this and referring to Fig. 1, it would be called a 10 pole, 125 volt, direct current generator. For Fig. 2 it would be a 4 pole, 125 volt, direct current dynamo. They are made to carry 125 volts in order to provide a margin over what is actually necessary to give 110 volts at the lamps.

THE ARTIFICIAL LIGHTING OF SCHOOLS.

A recent number of the "Zeitschrift fur Beleuchtungswesen" contains an interesting aeticle written by Dr. J. J. C. Muller, of Bremen, describing the experiments he has made in certain high schools of that town upon the proper arrangement of the artificial lights, so as to secure full illumination upon the students' desks. At the outset, a rule was laid down that the strength of the illumination at all points in the room should be at least 2.04 candle-feet.

The first experiments he describes at length were carried out in a room 25 ft. 3 in. long × 23 ft. wide × 13 ft. 3 in. high. It was stripped of all furniture and fittings, and the walls and ceiling were given a fresh coat of lime wash. The source of artificial light consisted of four groups of "Tantalum" electric glow lamps, each group containing six lamps of 22 cp. arranged under a reflector of mirror glass. The positions for the lighting groups were found by dividing the room into four equal rectangles, and then hanging each group as nearly as possible from the point given by the intersection of the diagonals of the said rectangles. The amount of energy consumed by the lamps was about 1,080 watts, and they were provided with ground-glass globes. The benches ordinarily used in the room were 2 ft. 10 in. high. Measurements of the illumination afforded were made (1) with the lamps 6 ft. 6 in. above the desks, (2), with the lamps 8 ft. 3 in. above the desks, and (3) with the lamps close to the ceiling, i. e., 10 ft. 4 in. above the desks. In the first case the illumination varied from 5.5 to 3.4 candle-feet, in the second from 4.8 to 3.5 candle feet, and in the third from 4.2 to 2.9 candle-feet. In order to see the effect of the reflection from the walls, two sides of the room were next almost entirely covered with blue photographic prints, the lights being in the second position. Measurements of the illumination in the same spots as before gave readings of from 4.6 to 2.8 candle-feet. Then several rows of benches 2 ft. 4 in. high were brought into the room, and three scholars placed at each of them, the lights being 8 ft. 10. in. above desk level. The illumination was found to range from 3.8 to 2.7 candle-feet, one spot having only 2.3 candle-feet, but probably this was in shadow. As a result of his experiments the author concludes that such a system of direct lighting by means of four groups of six 22 cp. glow lamps with matt globes and mirror reflectors placed at a height of from 8 to 9 ft. above desk level gives a sufficiently bright and uniform light for a room of the size in question, even when allowance is made for the gradual soiling of the walls and ceiling, and the diminution in illuminating power of the lamps themselves. The illumination at writing level is not likely to fall below the 2 candle-feet required.

The next series of experiments were carried out upon indirect lighting by means of arc lamps. The room used was 34 ft. long × 24 ft. 3 in. wide, freshly whitewashed as in the former case. Two Siemens-Schuckert school lamps for indirect lighting were employed, slung approximately from the longer diameter of the hall about 8 ft. from either end of wall, i. e., about 18 ft. apart. The lamps required 10.4 amperes of current, and absorbed 1,144 watts. They were fitted with metallic reflectors, which threw all the light upwards on to the ceiling and on to a strip about 4 ft. wide at the upper part of the walls. Measurements were then made in the empty room of the illumination at bench level. The values obtained ranged from 4.7 to 2.5 candle-feet in some 15 different situations and it was found that the two lights would be more advantageously placed if 23 ft. apart instead of 18 ft. The room was then filled with its complement of eight double school benches of three seats each, and the places were filled up with grown men. Measurements of the illumination were made in 32 places, between each of the supposed students. The values obtained varied from 2.3 to 1.6 (in one spot only 1.45) candle-feet, and it was evident that the light was very uniform in spite of the living obstacles to its equal distribution. If the separate desks used in higher grade schools had been put into the room instead of the forms belonging to elementary schools, the scholars would have been further apart, and the illumination would probably not have fallen below 2.3 candle-feet at desk level. This would have left a sufficient margin for loss of reflective power as the walls and ceiling became dirty to insure a permanent illumination equal to the necessary 2 candle-feet.

It is interesting to observe that the direct incandescent electric light, which gave an illumination at working level equal on the average to 4.1 candle-feet in the first school room when empty, gave only an average light equal to 2.85 candle-feet when the room was fully occupied with benches and scholars, i. e., it suffered a loss of about 30 per cent. The indirect arc light employed in the second hall gave a strength of illumination equal, on the average, to 3 candle-feet in the empty room, which fell to 2 candle-feet when the room was filled. This loss was equal to about 33 per cent. Shadows were distinctly noticeable under the direct light, but were almost entirely absent from the indirect illumination.

Tests were also made of the illumination afforded by a single 10.4 ampere indirect arc lamp in the smaller room mentioned above. It was found that the light was everywhere below the minimum of 2 candle-feet, ranging, in fact, from 1.7 to 1.1. To light such a room properly with indirect arc lamps, one of 15 amperes would be needed, or two of 8 amperes. The latter plan would be preferable in most cases, because at the usual pressure of 110 volts two arc lamps must be put in series.

It will be noticed that, using Tantalum lamps consuming about 2 watts per candle, the power used in the two cases was about the same. If, however, ordinary carbon filament lamps had been employed they would have consumed twice as much power as the inverted arc lamps. Further, the lighting, in effect, would not have been so good, for the pupils of the eyes would contract in presence of the exposed glow lamps globes, whereas with the indirect lighting this would not occur.—"Electrical Review," London.

FRENCH ELECTROMOBILES FOR POSTAL SERVICE.

BY C. L. SMITH.

In the latter part of October, 1904, there was put in service by the Postal and Telegraph Department of Paris 15 electromobiles for use in carrying the mail between the various branch offices and railroad stations and the Central Post-office. Of these 15 cars 12 are to be used regularly and 3 held as a reserve. These cars, one of which is shown in Fig. 1, were constructed by the well-known firm of Chas. Milde & Co. of Paris. They have a large box in the rear with a flap door behind, the box having a capacity of 1.5 cubic meters.

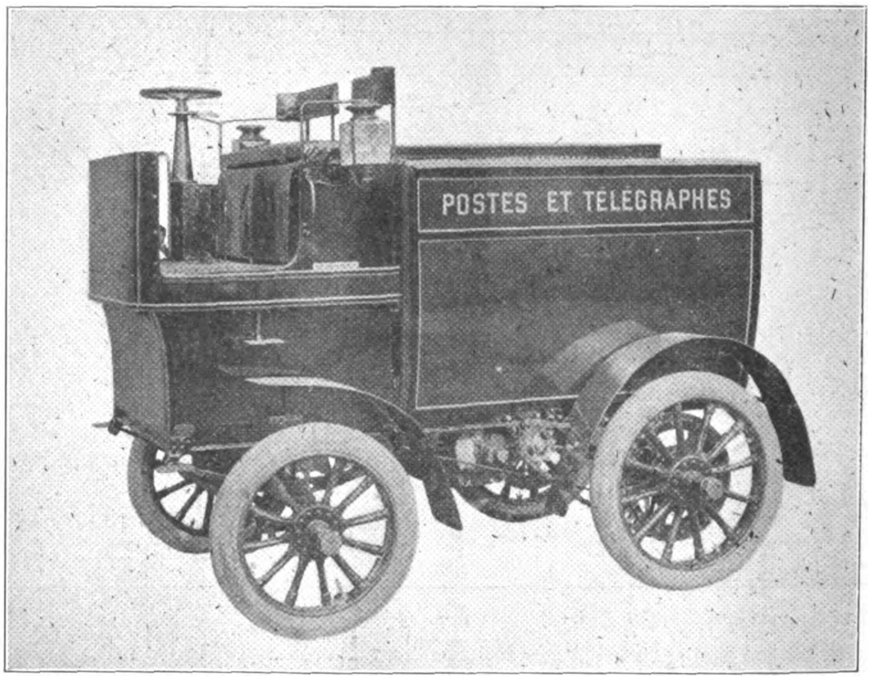

Fig. 1.—French Postal Electromobile in Use in Paris.

The accumulators consist of 44 elements of the Heinz type of 150 ampere hours, and are contained in a case situated under the driver who sits on an elevated seat in front. The case holding the accumulators weighs 650 kilograms.

The electric motor is placed at the center of the chassis and drives the rear wheels by chains. A charging station has been installed in the central building and from noon to 4 o'clock the cars can be charged, each car taking five minutes for the operation. They then continue in service for 10 hours, each charge being sufficient for a distance of from 40 to 45 kilometers.

The electromobiles were required to make a speed of at least 18 kilometers per hour, and they have attained speeds of more than 25 kilometers per hour.

The controller has eight forward speeds and three backward speeds, thus enabling the driver to take the speed of the vehicle in front of him without constantly cutting off the current. A small pedal under the right foot of the driver controls the brake while one under his left foot cuts off the current. The rear wheels measure 920 mm. and the front ones 820 mm., while the wheel base measures 1.6 meters. The weight of the car when empty is 1,800 kilograms.

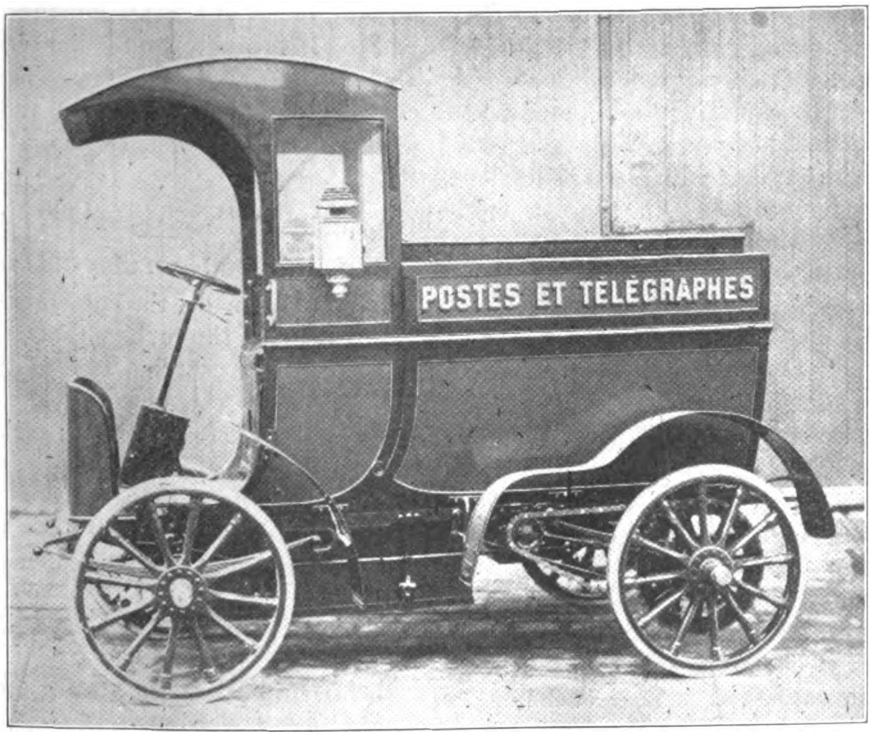

Fig. 2.—Another Type of Electromobile Used for Postal Service.

These motor cars, a new type of which is seen in Fig. 2, have given excellent satisfaction, and it is stated that the system will be extended.

Messrs. Camona, Giussani, Eurinelli & Co. have also constructed a new type of electric mail van, which is in use in Milan, Italy. It is fitted up inside like an ordinary postoffice and has special heating and ventilating apparatus, the ordinary daily run being 16 miles. The car, which weighs about 2,500 pounds, is equipped with two motors, capable of driving it at the rate of 16 miles per hour, the driver standing in front. This mail van has also given satisfaction.

ELECTRIC POWER IN GERMAN COAL MINES.*

In an interesting paper read before the Mining Institute of Scotland, Mr. E. O. Foster Brown describes some of the electrical power installations at German collieries.

Of the three principal coal mining districts, Westphalia, Silesia and Alsace-Lorraine, Westphalia appears to have made the greatest strides in experimenting with and applying electricity for mining purposes, although, in the author's opinion, the conditions prevailing there appear to be scarcely as favorable for its adoption as in Silesia. In Westphalia the seams are fiery, but boiler coal is of much greater value than in Silesia, so that any saving of power is an important economy, and there is also probably more capital available for expenditure on new plant in that district.

The system of current used for general purposes at all of the newer plants is, with rare exceptions, three-phase. "The central power houses of the newer plants are well built and roomy, and fitted up in some instances on a most lavish scale." Whilst no doubt it is very nice to have engine rooms well fitted up, to do so on a "lavish scale" is scarcely what an English engineer would care for; he would no doubt prefer to spend the money over the machinery. Power houses are no better with stained glass windows and beautiful tiled walls and floors.

At coking collieries there is a tendency to take gas from the ovens, which after purification is used to drive gas engines; and it is stated that the power generated by this method, as compared with that of burning the gas under the boilers and generating electricity by the steam so raised, is rather more than double.

The voltage varies very much with the conditions; for three-phase current it is not, as a rule, less than 1,000 volts; usually it is 2,000 or 3,000 volts, and sometimes 5,000. Continuous current does not, as a rule, exceed 500 volts. The three-phase high pressure current is, in the majority of cases, transformed down to 200 or 300 volts at the motor.

The purposes to which electricity is chiefly applied may be stated roughly, in their relative importance, as: Pumping, ventilation, winding, haulage, coal-cutting and air-compressing. With regard to pumps, the tendency in plunger pumps is to increase the speed to the utmost limit of practicability, so as to drive with slow direct connected motors and eliminate the use of gearing. The pump of the future, however, appears to be the centrifugal type. Whilst the efficiency is not so high as that of the plunger pump, other advantages, such as less cost for the same capacity, less space occupied, less attention, lubrication and repair, and more particularly its suitability for driving by electricity, as both pump and motor give the best results when working at a high speed, more than counterbalance the lower efficiency. Centrifugal pumps are already extensively used for high as well as low lifts, and give excellent results when used for sinking purposes.

As an instance showing the small attention required for electrically-driven ventilators, the author says: "The Reatean fan . . at an isolated ventilating shaft belonging to the Saar-Mosel Colliery Company displaces 110,000 cubic feet of air per minute, and is driven by a three-phase motor of 5,000 volts, keyed direct on the fan shaft, running at 300 r.p.m. The door of the ventilator house is kept locked; every three weeks the motor is cleaned, which takes two hours, and every three months fresh oil is put into the bearing cups, otherwise no one goes near the house. The fan has been running satisfactorily and continuously for a year under these conditions. Comment is needless.

As to winding engines, the author says: "Winding engines of high power have only lately been erected at one or two collieries, but a number of smaller engines, chiefly constructed on the Ilgner principle, are working at subsidiary shafts, where they are mainly used for lowering men and material." As is now well known, the two large winding plants erected in Germany are at the Preussen II Colliery, Westphalia, and the Zollern II Colliery, Westphalia.

---

*From the "Electrical Review," London.

At the former, the winding engine is placed in a house close to the generator and winds with a Kœpe pulley; it is driven by a three-phase slip-ring motor keyed direct on the shaft. The generating plant for supplying power to drive the winding engine consists of two cross-compound horizontal steam engines, each driving a three-phase alternator of 2,000 volts at 86 to 94 r.p.m. The winding engine appears to be under good control and winds satisfactorily, but the effect of this system on the generator engines is not ideal. Between winds the generating steam engines are running at 94 r.p.m., with only sufficient steam to overcome the friction of the working parts at that speed; on starting to wind, their full power and something more is required of them, and they take their full steam and lose 7 or 8 r.p.m. in speed almost instantaneously, gradually regaining their full speed as the wind proceeds and the demand for power lessens. Near the completion of a wind full power is usually required in the opposite direction for braking purposes, and the same thing takes place although the engines are fitted with sensitive governors. Under such conditions this type of electric-winding engine is not likely to prove successful; but, on the other hand, if the generating station were very large and supplied power for a large number of other purposes, the effect of starting the wind would be barely noticeable on the steam engine driving the generators. It is unlikely that—except for very small winding engines—three-phase current will be applied to motors directly driving the winding drums, and where three-phase current can only be supplied this will be converted into continuous current by means of a converter fitted with a heavy fly-wheel.

At Zollern II Colliery the winding engine is constructed on the now well-known Ilgner system. An elaborate electric plant has been erected, the interesting characteristic of which—compared to others recently erected—is the exclusive use of continuous current and the shunt regulation of the motors. The winding engine is at present winding 1,200 tons of coal in 12 hours from a depth of 918 feet. This type of winding engine, although more costly than the type in use at the Preussen II Colliery, has a great advantage in demanding an almost constant instead of an intermittent load from the generators, at the same time being under very efficient control.

The question of electric or steam winding resolves itself into one of £, s. d. If the saving in fuel will more than cover the interest on the extra capital to install the plant, more depreciation and upkeep required with more delicate machinery, then by all means install electric winding plants; but, on the other hand, if the saving will not be large, as when the fuel is of little or no value, then keep to the steam engine, but install a good one. As Mr. Brown says: "Until electric winding engines of a large size have been conclusively proved to be as reliable and efficient as steam engines, and at the same time show a substantial saving in fuel and upkeep, sufficient to repay the original capital outlay, electrical power is not likely to be applied . . . where the winding engines consume the largest proportion of power required for working the colliery." Further, compared to collieries in this country, both the Preussen and the Zollern collieries are small as regards the output. An English engineer would expect at least double the output in the same time for probably only a small portion of the outlay invested at the Zollern Colliery.

WRINKLES.*

EDITED BY H. C. ABELL.

Stopping Air Leaks in Boiler Settings and Doors.

Packing cracks in brickwork and around door frames with asbestos wicking will materially reduce the amount of cold air going through, and will, if economizers are in use, help to raise the temperature of the feed water.

H. C. Hall, Fall River, Mass.

Receiver Steam to Heat Boiler Feed Water.

In case the exhaust steam does not heat the feed water sufficiently, we have found a gain can be made by admitting steam from the receiver of compound-condensing engine direct to heater.

B. E. Buttles, Denver, Col.

Increasing the Heat of Feed Water.

In the vertical header type of horizontal water-tube boilers the iron doors on the rear end of the setting radiate a great quantity of heat; by taking a lot of old pipe coverings of magnesia, etc., that was not fit for re-use on the pipes, breaking it up and mixing it with water, then baking it in short pieces of I beams for moulds we made a number of slabs, which were fastened to the inside of the doors; this saved a lot of heat, and as economizers are used the increase in the temperature of the feed water was noticeable.

H. C. Hall, Fall River, Mass.

Hot Feed Water.

Our electric equipment consists of six Corliss condensing engines and one De-Laval turbine. The condensing water is of such a quality as to be unsuitable for feed water, even though a suitable separator were used to take out the oil. We are contemplating installing a jet condenser on one turbine and using our regular boiler-feed water in it for condenser water. As there is no oil introduced into the water it can be used for boiler feed, heating it up to a certain degree before passing it through the regular feed-water heaters. With this arrangement the condenser may be made to fulfill two uses—that of a condenser and of a feed-water heater.

C. W. Humphrey, Denver, Col.

Turbine Boiler-Tube Cleaners.

As usually made, the cutters are so far in advance of the turbine that removing scale from the extreme end of the tube is difficult, as the cutters begin to cut about a foot from the end; making an extension piece to fit the tubes, so as to practically lengthen the tube a foot or more, solved the problem of how to make the cutters work on the extreme end of the tube.

H. C. Hall, Fall River, Mass.

Equalizing Heat in Steam-Heating Risers.

In a steam-heating system it was found that some risers were getting more steam than others, on account of being piped with Tees instead of Ys; a plug with a small hole drilled through it, inserted in the riser getting the most steam, will choke part of it off and send more through the other pipes, and so equalize better.

H. C. Hall, Fall River, Mass.

Grinding in Seats of Safety Valves.

It is sometimes necessary to grind in the seats of safety valves without disturbing the set of the spring; after taking off the lock, cap and test lever there are usually found two nuts for the fork of the test lever to lift valve from seat; when testing valve with boiler under steam, by inserting a piece of pipe between head bolt and these two nuts, and clamping the pipe tight, we can then take off the bonnet without disturbing the set of spring and grind in the valve.

NOTES ON THE INDUCTION MOTOR AS A GENERATOR.*

BY T. P. E. BUTT.

It has been known almost from the initial invention of the asynchronous alternating motor, generally known as induction motor, that, if connected to its supply mains and driven at a slightly higher speed than synchronism, it reverses its usual function and becomes a generator. There is another point in such machines equally interesting, and perhaps more useful, demonstrated by Danielson about two years ago. He described a method of converting an alternating current motor from asynchronous to synchronous by suitably exciting the rotor with continuous current. This is a point for which much use should be found, for such machines, in addition to possessing the inherent qualities of the synchronous motor, are self-starting. In order to effect this the motor is started up as an induction motor on light load, so that its speed approximates synchronism. At the right moment the motor is switched over from the resistance to a suitable source of continuous current, which pulls it into synchronism and maintains it at this speed. Such machines should be of use on inductive systems to raise the power factor, where such an inflexible arrangement as the ordinary synchronous motor may not find favor. Circumstances having placed the writer in a position to test the above principle, he assumed that the converse would hold good; that is, if power were applied to the rotor shaft, and its windings supplied with continuous current, the outcome would be a successful generator. The results are given in this paper, and, although not obtained under favorable conditions, are of interest.

About two years ago, when it was decided to augment the lighting supply of Johannesburg from the electrical plant of the Robinson Deep G. M. Company, it was found necessary to obtain an additional generator to provide a reserve for the existing plant, in case of accidents and to allow for general repairs. The management did not at first agree with this idea and the project temporarily fell through. It happened, however, that a 300 hp. 2,000-volt induction motor, originally intended for operating a hoist, had been lying dismantled on the property for several years, and the suggestion of the writer to convert this into a generator was entertained and adopted.

It should be explained here that the generator plant consisted of two direct-coupled three-phase 250-kw. machines working at 2,100 volts 60 cycles, and the power demand was such as to require one generator constantly running, the second assisting on the peak of the load for several hours during the day, whilst from 4:30 P.M. till midnight this second generator was loaded and often overloaded for the municipal supply, and although in case of accident to either generator the mine requirements would have had first consideration, the town supply was sufficiently remunerative to warrant the installation of another machine. Owing to the difficulty in getting an engine suitable for driving this machine at short notice it was arranged to operate it from one of the mill engines, a 500 hp. single-crank, compound engine, having at that time a surplus of about 300 hp. A friction clutch and pulley were attached to an extension of the line shafting, and rope drive provided. This necessitated the location of the generator in a wing at the extreme end of the power house, in a position invisible from the main switchboard.

To use the generator asynchronously involved very little alteration in the existing apparatus. The windings, of course, remained the same, but it was necessary to make provision for a variable speed for this machine, which, unlike the ordinary generator, requires a slight increase of speed to take an increased load. To get a variable speed from the mill engine was out of the question, and recourse had to be made to other means, viz., magnetic slip; this demanded the installation of the huge rheostat which originally formed the controller. This method would not be an efficient one if constantly used, but this was not intended, its use being restricted, as a rule, to the short period of time required in putting in, or taking out of parallel with another generator, to regulate the transfer of load. This arrangement demanded a permanent increase of speed above that of synchronism, and an increase of 5 per cent. was allowed, which was as much as possible, taking independent working into account. The controller was located near the generator and operated by motor from the switchboard, the position of its axle being indicated by luminous signals.

The arrangements for asynchronous running were practically complete, but for independent working an exciter was required, suited to the rotor winding, and for this purpose a disused plating dynamo was found having a capacity of 900 amperes at 30 volts. A low tension panel was installed near the generator, and the rotor windings connected to it, provision being made for rapidly connecting them to either the exciter or controlling rheostat.

The frequency of the asynchronous generator is determined solely by the currents supplied to it by the synchronous machine regardless of its own speed. The speed, however, must not rise above a certain critical value, or the power required from the prime mover will fall off rapidly, due to magnetic leakage, as in the case of the motor. Provision then must be made for this in governing the engine, or should this point be exceeded the engine might run away. The power-factor will be dependent on the amount of load supplied to the system, but independent of the nature of such load, so that any currents demanded by apparatus employed on the system not in phase with the working current must be supplied by the synchronous machine. Paralleling is of course, a simple matter, there being no need for synchonizing; it is always better though to get the speeds as near as possible to avoid disturbance to the system if the machine is of large relative capacity.

When the machine is connected up to operate as a synchronous generator, the rotor is simply transformed into a field magnet with a continuous iron surface, instead of the usual definite polar projections.

The first trial took place under asynchronous conditions; the machine, it should be stated, had a distributed winding, three slots per phase per pole in stator and four in rotor, the number of poles being 24, so that the permanent speed was 315 revolutions, or 5 per cent. above synchronism at 60 cycles. At this speed, or near it, and with the rotor resistance all in circuit, the switch was closed on the bus bars, thus parelleling it with a synchronous generator which at the time was delivering 90 kw. A current equivalent to 30 per cent. of the non-inductive full-load current was taken, and under these conditions the disk movement of a sensitive watt-hour meter in circuit was scarcely perceptible; the resistance was then cut out, until the whole load was taken, and steam was then shut off the synchronous machine, which continued running as a motor. After this steam was again admitted and the load increased and distributed by means of the rheostat on the two machines until a combined load of 362 kw. was carried, out of which the induction machine supplied 170 kw. This was the limit attained and was determined by the speed of the mill engine, which was not well governed and this point became unstable, thus causing sudden transfers of load between the generators and big voltage variations. A higher limit would have been obtained with a more favorable load—that is, motors of relatively small capacity or lights—but nothing less than 50 hp. motors were available, and the switching on of such at this stage would cause a marked fall in speed of the mill engine, upon which heavy surgings of current would take place, knocking the voltage beyond control and dislocating the service.

---

*Abstract of a paper read before the South African Association of Engineers. From the "Electrician," London.

The machine was next tried as an independent generator. More interest was attached to this test, as if the operation proved successful, this method of working would have considerable commercial value. Two methods of exciting the rotor were available, either by cutting out one branch of the winding altogether, and connecting the other two in series to form the path for the current, or by connecting two branches in parallel and putting the combination in series with the third. This latter method was found to be more economical in exciting current. The trials under these conditions and with an induction-motor load resulted in attaining an output of 180 kw. before the engine governing gave trouble The excitation at this load was 7 kw. On a lighting load the results were extremely satisfactory, the output limit being largely increased; in fact, on certain occasions of big demand at the municipal lighting station, loads up to 315 kw. have been delivered with an excitation of 330 amperes at 25.5 volts. The engine under this load had got beyond governor control and fallen 4 per cent. in speed, but beyond this showed now signs of distress. This load, however, was abnormal, the maximum seldom exceeding 260 kw. The excitation required at no load was 138 amperes at 9.5 volts or 1,311 watts as against 27 amperes at 133 volts (3,591 watts) for the regular generator. At loads of 180 kw. on similar power factors of approximately 0.75, the excitations were 6.4 and 5.2 kw. respectively; here the longer air-gap of the regular generator tells to advantage. On similar loads (lighting) of 220 kw. the order is reversed, the regular generator requiring 5.2 kw. against 4.5 kw. of the converted machine.

The excellent results obtainable on non-inductive loads, neglecting the part due to less armature reaction, were attributable to the gradual assumption of the load, under lighting conditions, as distinguished from the sudden changes caused by switching on motors of large relative capacity, when on inductive loads. The temporary pulling up of the prime mover under the latter conditions, was, of course, noticeable on lighting loads when heavy banks of lamps were thrown on; but this occurred very seldom; and it is obvious that, although inconvenient in such cases, it had not the dangerous factor which such occurrences might mean to motor loads. This machine offers another field of usefulness as a motor, and with its present connections can be used in case of emergency to drive half the mill (100 stamps), no change at all being necessary beyond disconnecting the mill engine.

Independent working was certainly a success, and up to the time of the writer leaving the company it was nearly always used as such. The short air-gap and low flux density in the rotor, although favorable as a motor, allowed a big armature reaction when generating on inductive loads, but the effects of this would not have been so noticeable with automatic voltage regulation, such as, say, the Tirrell system. As to the use of such machines in mining districts, such as the Witwatersrand, it depends entirely on circumstances. No doubt in the near future isolated electric generating plants will disappear and be replaced by central supply stations, operating over suitable areas. When such a system is actually in sight, any immediate addition to the generating plants of mines likely to be affected by the change could be provided for by a machine such as described, which, on conversion of the systems, could at once resume its original role as a motor.

ENGLISH ELECTRICAL NOTES.

(From our London Correspondent.)

London Electrical Exhibition.

Shortly after these lines appear in print the electrical exhibition, for which extensive preparations have been in progress for months past, will be opened at Olympia. It is being opened on September 25 and will remain open for one month. There has not been a large and representative electrical exhibition in London, or indeed in England, since the Crystal Palace show of 1892. Between that date and this—13 years—has happened the great rise and progress of practically all heavy electrical engineering application, at any rate in England, so that the Olympian show has a splendid opportunity. The initiative in regard to the exhibition was taken by the National Association of Electrical Manufacturers, but they have also enlisted the support of engineers running electric light and power stations, and manufacturers in general.

We might say that the show has been primarily started with the idea of popularizing electricity and its varied uses with the general public, while it was also to be a counter-blast to the big Gas Exhibition which was held some months ago in London, and seemed to give a new lease of life to gas engineers and gas lighting, the values of gas companies' shares appreciating in the market as a result.

The exhibition comes at the right time for the City of London Corporation is turning out its electric arc lamps in some important streets and reverting to gas. The revival of interest in electric lighting is certain to follow the Olympian show.

The Electrified District Railway.

On Sunday, August 27, the Metropolitan District Railway Company commenced to run a new service of electric trains from Wimbledon and Putney, through London to Whitechapel. The company is now working the whole of its services by electric traction, with the exception of the Inner Circle service, the steam trains of the London & North Western Railway Company which traverse part of its track. The latter trains will be hauled by electric locomotives over the District Section later on, and the District Company is experimenting with a London & North Western train now, preliminary to that arrangement being carried into effect.

The Thornhill Power Station.

Another of the big power supply companies has finished the first of its generating and distributing sections. The Yorkshire Electric Power Company has one of the finest areas in the United Kingdom, containing a large number of towns which are expected to take supplies of electrical energy under a "bulk" arrangement, innumerable textile factories, collieries, engineering works, canals, etc. The area measures about 1,800 square miles in South and West Yorkshire, and in this area, according to the company's engineers' estimates, there is somewhere about 3,000,000 hp. at present, obtained chiefly from small steam units.

When the undertaking of the power company is complete it will have four generating stations, located at Thornhill, Bingley, Methley and Wath. Only the first of these has yet been proceeded with, and this will be extended, on the complete unit system, until its capacity is about 60,000 hp.

The present equipment of Thornhill

consists of four Babcock & Wilcox boilers and two Curtis steam turbines driving British Thomson-Houston alternators of 2,000 kw. each, running at 1,000 revolutions per minute. Current is generated at 10,000 volts, 50 periods, three-phase, and is transformed down at sub-stations to 2,000 and 400 volts. A third 2,000 kw. turbine set of exactly similar make is now constructing. Mr. H. F. Parshall is the designer of the installation. For some time past the company has been doing a good deal of educational work among the power users in its area, and it has just been holding an interesting exhibition of machine tools, showing some of the applications of motors to such purposes, for their edification.

New Officers of the Allis-Chalmers Company.

At the annual meeting of the stockholders of the Allis-Chalmers Company, held in Jersey City on Thursday, Edward D. Adams of New York, Mark T. Cox of East Orange, N. J., Edward C. Converse of New York, Joseph S. Neave of Cincinnati, O., and Edwin Reynolds of Milwaukee, Wis., were elected directors. At a subsequent meeting of the board of directors Walter H. Whiteside of Milwaukee was elected president to succeed Benjamin H. Warren of New York, and Henry Woodland of Milwaukee, Wis., was elected treasurer to succeed William J. Chalmers of Chicago.

Ohio Society of Engineers.

Mr. E. J. Miller, secretary of the Ohio Society of Mechanical, Electrical and Steam Engineers, requests us to announce that the annual meeting of the society will be held at Canton November 17 and 18, when new officers will be elected and some proposed changes in the constitution acted upon.

Elevated Road Accident.

A serious accident occurred last Monday morning on the elevated road in this city. A train on the Ninth Avenue line on its way down town jumped the track at 53d street. One car fell to the street, and another was overturned and took fire from the third rail. Twelve persons were killed and forty or more seriously injured.

Proposals Invited.

The Navy Department, through the Bureau of Supplies and Accounts, is inviting sealed proposals until September 26 for furnishing Eastern navy yards with the following electrical material: Schedule 125, cable and electrical supplies; schedule 126, mica, incandescent lamps, voltmeters, electrical supplies, etc. Blank proposals can be obtained of the Bureau in Washington or at the Navy Pay Office in New York.

On the same day the Bureau will also open bids for the delivery and installation of three water tube boilers and machinery for the power house at the Naval Hospital, Washington. Applications for proposals should refer to schedule 131, which will be furnished by the Bureau.

Sealed proposals, in triplicate, are being invited until October 4 for extending the electric lighting system at Fort Leavenworth, Kan. Full information and blank forms of proposal will be furnished on application to Captain J. E. Normoyle, Quartermaster, Fort Leavenworth, Kan.

Wire Rope Lubrication.

Elevator and other cables used for hoisting purposes are subject to both internal and external wear; the former is caused by the rubbing of the wires and strands upon one another under pressure in bending over the sheaves, the latter by rubbing and wedging in the grooves of the pulleys.

Unless the cables are kept well lubricated they wear and deteriorate rapidly.

As a lubricant for wire rope Dixon's Ticonderoga Flake Graphite has the indorsement of the leading manufacturers as well as the approval of those experienced in its use, because of the well recognized fact that flake graphite prevents the abrasion and wear of all parts coated with it. For this purpose graphite must be combined with suitable greases to make it adhere, but there has always been considerable danger and difficulty in applying grease to moving cables.

Dixon's Handy Graphite Rope Dressing supplies the ideal qualities of Dixon's Flake Graphite as a wire rope lubricant in such a form as to make it thoroughly acceptable to practical men who have used it. The package is of about the size and shape of an ordinary book and contains nearly three pounds of graphite lubricant. It is easily applied by holding the open edge of the package against the cable while in motion.

There is no trouble and no danger to the workman, no waste nor dripping off of lubricant. The economy and efficiency of Dixon's Handy Graphite Rope Dressing in prolonging the life of wire rope and saving the expense of frequent renewals of worn cables, should commend it to the careful attention of every firm operating hoists or elevators.

For prices and full particulars address the makers, the Joseph Dixon Crucible Company, Jersey City, N. J.

ELECTRICAL PATENT RECORD.

LETTERS PATENT ISSUED SEPT. 5. 1905

Electric Railways and Appliances

798,593. Fender. William J. Birchell, Phoenix, Ariz., Filed March 6, 1905.

798,673. Trolley. Robert G. Griswold and Charles C. Willits, Quincy, Mass., assignors of one half to Jerry Morrow, Wellston, O. Filed Oct. 13, 1903.

798,691. Trolley-Finder. Jerry Morrow, Wellston, O., assignor of one-half to R. G. Griswold and C. C. Willits, Quincy, Mass. Filed July 6, 1904.

798,742. Automatic Train-Signal. Clay H. Martin, Jackson, Mich. Filed Dec. 20, 1904.

798,911. Car-Fender. Paul Luther, Allegheny, Pa., assignor of one-half to John F. Fox, Greensburg, Pa. Filed May 12, 1905.

798,915. Electric Switch. McGonigale Miller, Louisville, Ky., assignor of one-half to Herman C. Tafel and one-half to Edward W. Wolff, Louisville, Ky. Filed Sept. 30, 1904.

798,968. Life-Guard to be Applied to Electric Tram-cars. Harry Lambelle, Middlesbrough, Eng. Filed Aug. 25, 1904.

Electric Lights and Appliances

798,932. Electric-Lamp Socket. George B. Thomas, Bridgeport, Conn., assignor to the Bryant Electric Company, same place. Filed March 6, 1905.

798,954. Electric Incandescent Illuminating Apparatus. Gerald B. Francis, Woking, Eng. Filed Dec. 17, 1904.

Electrical Machinery and Apparatus

798,606. Machine for Insulating Electrical Conductors. Charles H. Hawkins, Long Island City, N. Y. Filed Nov. 28, 1904.

798,641. Machinery for Making Electromagnets. Richard Varley, Providence, R. I., assignor to the Varley Duplex Magnet Company. Filed Oct. 1, 1903.

798,648. Current-Motor. August Wiebke, Miles City, Mont., assignor of one-half to Robert E. Gruwell, same place. Filed July 14 1904.

798,689. Reversible Power-Transmitter. Alexander H. Masters, Greensboro, N. C. Filed Dec. 10, 1904.

798,702. Spark-Ignition Device for Explosive-Engines. Thornton B. Rennell, Denver, Col. Filed Dec. 30, 1903.

798,770. Governor for Dynamos. Charles A. Eck, Newark, N. J. Filed Aug. 12, 1903.

798,826. Regulator. Alphonse F. Pieper, Rochester, N. Y. Filed Aug. 29 1903. Renewed March 3, 1905.

Telephones and Telephone Apparatus

798,659. Annunciator. Charles C. Cadden and James I. Gemmill, Cleveland, O., assignors to the Williams-Abbott Electric Company. Filed June 11, 1903.

798,720. Telephone-Repeater. David H. Wilson, Chicago, Ill., assignor to George W. Kretzinger, same place. Filed Feb. 14, 1903. Renewed Feb. 11, 1905.

798,838. Telephone Exchange System. Ernest H. Strauss, Chicago, Ill. Filed Aug. 29, 1903.

798,853. Memorandum Attachment for Telephones. Frank R. Welsh, Philadelphia, Pa. Filed June 8, 1905.

799,010. Telephone System. Oscar M. Leich, Chicago, Ill., assignor, by mesne assignments, of one-third to said Leich, one-third to J. G. Ihmsen, and one-third to Max W. Zabel, same place. Filed Feb. 9, 1900.

799,019. Telephone Switch. Michael Setter, Chicago, Ill., assignor to the American Electric Telephone Company, same place. Filed Sept. 13, 1902.

Miscellaneous.

798,602. Automatic Carrier for Electric Wires. Frank E. Detchon, Delta, Col. Filed Aug. 4, 1904.

798,671. Automatic Telegraph. Alfred C. Gilmore, Chicago, Ill., assignor to James H. Peirree, trustee, Chicago, Ill. Filed March 10, 1903.

798,676. Electric Sign. Carl Haller, Chicago, Ill., assignor to the Haller Machine Company. Filed Oct. 19, 1904.

798,747 Electric Heater. Frank O'Hanlon and Joseph F Kelly, Philadelphia, Pa., and Henry S. Vautier, Camden, N. J. Filed Sept. 6, 1904.

798,748. Conduit for Electrical Conductors. William C. Robinson, Allegheny, Pa. Filed Oct. 5, 1904.

798,790 Electrolytic Process. Carl Hering, Philadelphia, Pa. Filed July 13, 1901.

798,803. Pocket Electric Burglar-Alarm. Herman A. Kreh, New Orleans, La. Filed Dec. 30, 1904.

798,804. Heat-Insulator. Emil Kune, Chicago, Ill. Filed Dec. 17, 1904.

798,906. Storage Battery. Alfred E Knight, Somerville, Mass., assignor to James H. Churchill, trustee, Quincy, Mass. Filed Nov. 16, 1904.

799,016 017. Electric Bell or Like Device. Carl J. Schwarze, Adrian, Mich., assignor to the Schwarze Electric Company, same place. Filed May 31 and Sept. 19, 1904.

THE TELEPHONE WORLD.

Independents Growing in Indiana.

Statistics have lately been compiled showing the growth of Independent telephone companies during the fiscal year ending July 30. The data has been computed from the tax returns of the 305 companies operating in 84 counties in Indiana. The total investment of these concerns, capital and bonds, have increased during the past year $3,718,458.90, or 51 per cent. In 1904 the companies were operating 106,554 telephones and in 1905 there had been an increase of 26 per cent., or 27,320 telephones. The gross annual earnings in 1905 exceeded those of 1904 by $1,055,145.88, or 77 per cent. The gain in net earnings for the same period was $118,115.56, or 35 per cent.

A prominent manager of one of these companies stated that the Independent telephone companies in Indiana have made immense progress during the fiscal year just closed. The thousands of new telephones that have been added show that a great deal of new work has been done. The increase in earnings show that the plants have been operated at a large profit.

In no other State in the Union at the present time are the Independents more prosperous or growing at a greater rate, and the future is the brightest in the history of the movement.

The Bethel-Newry Telephone & Telegraph Company has been organized at Newry, Me., for the purpose of constructing and operating telephone and telegraph lines in the towns of Bethel and Newry, with $5,000 capital stock, of which $540 is paid in. The officers are T. H. Jewett, of Bethel, and W. N. Powers, of Newry.

The Rose Hill, N. C., Telephone Company will build, equip and operate lines through the counties of Duplin, Pender and Sampson, and through other sections of the State. The home office will be at Rose Hill. There has been subscribed so far $1,200. The company may increase its capital stock to $50,000. The incorporators are James C. Williams, Gabriel H. Robinson and Maury Ward, all of Rose Hill.

A. A. Burch, manager of the Citizens' Telephone Company of Battle Creek, Mich., states that the outlook for Independents in that State is very good. His company continues constructing new toll lines, and has recently finished one to Gull Lake, Yorkville and Augusta. The Battle Creek exchange of the Citizens' Company is receiving orders for telephones faster than it can fill them.

The Jefferson County Telephone Company of Fairfield, Ia., recently added at an expense of $2,000 a new up-to-date 200 capacity switchboard, and is adding new ringing and listening keys and tables, new circuit changers, clear out drops and flashlight transfers, thus insuring more rapid and efficient service to its patrons.

The Luther, Ind., Telephone Company, capitalized at $1,500, has been incorporated. Henry Wilson, president, and William O. Stall, secretary.

In order to extend its system the White Cloud, Kan., Telephone Company has increased its capital stock from $75,000 to $150,000.

Iowa Independents to Meet This Month.

Independents from Northeastern Iowa will meet at Waterloo, September 15 for a general discussion of conditions and for the transaction of such other business as may come before the meeting. The Corn Belt Telephone Company of Waterloo will extend a hearty welcome to the visiting telephone men and it is expected that the meeting will be the largest in the history of the association. Further development and bettering of toll lines will be one of the leading questions to be discussed before the association. This is a question which will afford a great deal of interest and is of vital importance.

There will be no set programme, but matters of general importance to Independent telephone men of Northeastern Iowa will be discussed. There will be a number of mutual and rural companies represented. S. S. Lichty is secretary.

A guarantee bond of $5,000 has been made by the East Tennessee Telephone Company for its conduit system, which will be the first system of the kind to be installed in Knoxville. The plans have been sent to the Nashville officials and as soon as they are approved the actual work of putting the cables of the company underground will be begun.

The Columbia Telephone Company has secured a franchise from the board of trustees of Kinderhook, N. Y., to enter that village with its telephone lines, and a permit to establish a line in Valatie will also be asked of the authorities.

The entire telephone service in South San Francisco, Cal., is being replaced upon a new basis, repairs being made, old poles being removed and new ones installed. The changes now being made will make the system as good as that in any other community in the State.

A company of Hanover and Milano, Tex., citizens have organized what is known as the H. R. F. Telephone Company, and have constructed a line from Milano to Hanover.

It is stated that the Government plans to purchase 1,300 sets of telephones for the new fiscal year. Five hundred will be field telephones and the rest are to be used for coast defense.

A report from Hanford, Cal., states that P. Kerr Higgins, of Los Angeles, has applied for a franchise for a telephone system in that city.

The new rural telephone system of Williamstown, N. J., now includes nearly 100 subscribers, the circuits extending to Sicklerville, Cross Keys, Turnerville, Janvier and Cecil.

The Adirondack Home Telephone Company is laying underground cables in the streets of Potsdam, N. Y.

The Cecil Farmers' Telephone Company is building a line to Calvert, Md.

The Citizens' Telephone Company has applied for a charter in New Haven, Conn.

W. C. Polk, of Toledo, O., representing the Central Telephone Construction Company, has begun the work of overhauling the plant of the Home Telephone Company at Mobile, Ala., which the Bell Company made an effort to purchase a short time ago and failed. The work is preliminary towards arranging for a long-distance service which the company proposes to establish, and which, it is said, will extend as far as Syracuse, N. Y.

The Holston Valley Telephone Company has been organized at Holston Valley, Tenn., with the following officers: David McConnell, president; J. D. Thomas, vice-president; Philip Painter, secretary and treasurer. The purpose of this company is to construct a telephone line connecting Holston Valley and the King's Mill section of Virginia with Bristol. This very large and prosperous territory has up to this time been without telephone conveniences.

A $100,000 telephone and telegraph company, to be known as the Chicago & St. Paul Telephone Company, has been formed by Judge A. G. Zimmerman and Attorneys Rufus B. Smith and Alfred T. Rogers. It will operate from Hudson to Milwaukee and other cities in Wisconsin between St. Paul and Stillwater, Minn., and to points in Illinois.

The Citizens' Mutual Telephone Company, with a capital of $50,000, has been organized by owners of the Independent telephone systems at Terre Haute, Dana, Sandford and Libertyville, Ind., also certain towns in Illinois. The organization aims to obtain franchises for a central office in Paris, Ill.

C. M. Weeks, A. B. Swain and others have incorporated the Gold Ridge Improvement Company with a capital of $11,500 for the purpose of owning and operating telephone and telegraph lines at Sebastopol, Cal.

In the first year of its operation, lately completed, the Eastern Illinois Independent Telephone Company of Kankakee, Ill., made a fine showing. It has 1,500 telephones in operation and is growing at the rate of 50 a month.

The Cuyahoga Telephone Company of Cleveland, O., has 18,000 subscribers. Its gross earnings for this year are $551,475.13 with a surplus of $105,542 23.

During the coming year the Lancaster, O., Telephone Company will greatly improve its exchange. It is estimated $60,000 will be expended in Lancaster and $10,000 on the improvement of the country service.

A deal has been completed whereby the Norman County, Minn., Telephone Company becomes owner of the entire system of telephones in the county.

The Liberty Telephone Company is extending its line through Montville, Me., and down through the Prescott neighborhood to the Appleton line.

The Independent Telephone Company of Council Bluffs, Ia., will install a manual system.

GENERAL ELECTRICAL NEWS.

LIGHTING.

Almond, Wis.—The village board has been asked to grant a franchise for an electric light plant. It is expected that this request will be granted at the next session of the board.

Chillicothe, Mo.—This city will soon have a new electric light plant to be owned by local capitalists.

Crawfordsville, Ind.—The city council and the trustees of the electric light plant lately met in special session to discuss the matter of repairing the electric light plant and installing a set of new boilers.

Fort Worth, Tex.—In the vote on the Armstrong franchise for permission to construct an electric light, power, gas and heating plant in this city, the majority was in favor of granting the franchise to Judge Armstrong.

Greencastle, Pa.—Work will soon be commenced on the new Greencastle electric light plant.

Greenville, Ky.—A committee, consisting of W. A. McKliffee, J. W. Lamb, J. W. Koontz, C. W. Taylor and T. J. Slaton, has been appointed to consider the construction of an electric light plant and waterworks at a cost of $36,000.

Indianapolis, Ind.—Alfred Kalter, a well-known promoter of this city, has purchased the electric light plant at Denver and secured a franchise for a new company. Mr. Kalter is supposed to be the representative of prominent Eastern capitalists.

Jackson, Miss.—The Jackson Light & Power Company has increased its capital stock by $10,000 and will enlarge its plant, installing new machinery for increasing the capacity.

Mountain Home, Ida.—Some time ago a franchise was granted to Seymour J. Bell, of Sumpter, Ore., to install an electric light plant here, and he has been at work on the $35,000 plant that he purposed installing.

Paulsboro, N. J.—A canvass is being made for subscribers to the proposed electric light service to be established for this place, Clarksboro, Mickleton and Berkley.

Richmond, Va.—An application will be made to the State corporation commissioners for a charter for an electric light and power company, to be operated in connection with the prospective electric railway from this city to Ashland. The capital stock is $100,000. Henry Anderson is president.

Washington, D. C.—A decision has been reached by the commissioners to have one lighting and heating plant constructed to supply both the new municipal almshouse and the industrial home school at Blue Plains, D. C., with electricity, instead of having a separate plant for each institution.

STREET RAILWAYS.

Albany, Ga.—There is a determined effort being made among some of our most public spirited and wealthy citizens and property owners to establish an up-to-date electric line in this city.

Auburn, Cal.—At a public meeting of citizens held recently resolutions were passed guaranteeing to John Martin a free right of way for an electric road from Grass Valley to this city.

Canton, Ill.—The franchise secured by the Illinois Central Electric Company for an electric railway through this city, has been transferred to the Cleveland Trust Company.

Cincinnati, O.—If plans which have been discussed by officials of the Cincinnati, Lawrenceburg & Aurora Traction Company are carried out within the next year, this city will have a fast trolley road into Indianapolis.

Dillsburg, Pa.—It is stated that cars on the Dillsburg Railroad will be run by electricity.

Fairmount, Ill.—The citizens have raised $1,600 of the $2,500 required for the interurban electric line that is proposed to be built from Catlin to this city.

Freeport, Ill.—The Freeport-Dixon electric railway seems a certainty. Peter Smith, who is interested in the scheme, announces that the franchise granted by the Dixon council some time ago has been accepted.

Ft. Scott, Kan.—Col. C.D. Beeson, general solicitor of the proposed interurban electric railway line, which contemplates making this city an important point on the line between Kansas City and Southwestern Kansas, is conferring with individual members of the franchise committee, with the view of taking up the franchise ordinances recently presented and passing the same.

Iola, Kan.—Hugh A. Holmes, of New York City, announces that the contract has been given for the proposed new electric railroad line from Kansas City to this city.

Lisbon, O.—Another railroad enterprise, having for its object the construction of an electric line from this city to East Liverpool, is in the field, and initial steps are being taken.

Menominee, Mich.—Work on the preliminary survey for the proposed electric railway between this city and Escanaba is progressing rapidly.

Mt. Vernon, N. Y.—The common council has voted to grant a perpetual franchise to the New York, Westcheter & Boston Railway. The road is to be operated by electricity, and the franchise gives the company the right to cross over or under various streets in this city.

New Albany, Ind.—The Louisville, New Albany, French Lick & West Baden Springs Electric Railway Company has been incorporated by John J. Weathers and Henry Terstegge.

Pittsburg, Pa.—President Frank G. Patterson, of the Southern Traction Company, has announced that within a month a contract will be awarded for the construction of 18 miles of road.—Application will be made September 18 for a charter for the electric street railway company, which proposes to construct lines in East Pittsburg, Turtle Creek and North Braddock.

Sidney, N. Y.—The outlook for the building of a trolley line between Ilion and this city is said to be very encouraging.

South Bend, Ind.—A trackless railroad will soon be put in operation here. It is designed to carry passengers and freight over the country highways in this vicinity.

Washington, Pa.—An important link in the connection of Pittsburg and Wheeling by trolley was lately provided for when a company was organized here to build a line from this city to Claysville, eight miles. Back of the scheme are D. M. Clark, J. R. Kuntz, W. P. Chambers, J. Y. Scott, J. L. Thistle and E. A. Willetts.

Waynesburg, Pa.—The Washington, Waynesburg & Monongahela Railway Company has been organized by local capitalists to build a trolley line between Washington and this city. The lines will pass through the towns of Swart, Dunns Station, Deerlick and Sycamore, and the townships of Franklin, Washington and Morris in Greene, and Morris and Franklin in Washington County.

POWER PLANTS.

Franklin Falls, N. Y.—P. B. McCahey, of Little Falls, has commenced the construction of the electric power plant here.

Mexico City, Mex.—The Mexican Power Company, a Philadelphia concern with an authorized capital stock of $10,000,000 gold, operating under a New Jersey charter, has been organized. It will utilize the water power of three rivers in the State of Mexico near Toluca and will send electrical current into this city estimated at 90,000 hp.

Tishomingo, I. T—The Southwestern Land, Power & Development Company contemplates developing water power and building an electric plant for the transmission of said power by electrity to operate a cotton mill, woodworking plant, etc., which will be established.

BIDS WANTED.

Columbus, O.—Sealed proposals will be received by the board of public service of this city at the office in the City Hall Building until 12 o'clock noon of September 19, for the sale and removal from the property of the city electric light plant, which consists of engine boiler, condenser, lamps and other equipment necessary to make up a complete plant. Each bid shall contain the name of every person interested in the same, and shall be accompanied by a certified check on a solvent bank of this city in the sum of at least $100, said check to be made payable to Charles H. Frank, secretary of the board of public service, and to whom the bids are to be addressed.

Fayetteville, N. C.—Bids will be received until October 1 for improvements to the electric light plant. E. W. Trafford, Richmond, Va., designing engineer, and W. Thomas Jones, superintendent.

High Point, N. C.—The Dixie Milling Company of this city wants prices on one 40 hp. motor and 10,500 feet of wire to run same from power plant.

Mt. Holly Springs, Pa.—Bids for lighting this town by electricity are asked by the borough officials. George R. Klopp, secretary, will furnish specifications and particulars on application.

Warren, Pa.—Sealed proposals will be received till 12 o'clock on September 15, for completion of the electric lighting system at the State Hospital for the Insane. Address S. R. Mason, Warren, Pa.

Wisner, Neb.—Sealed proposals will be received by William Armstrong, clerk of the board of village trustees, until 8 P.M. Septembr 18, for the furnishing and installing of an electric lighting plant.

NOTES FOR INVESTORS.

Latest quotations for copper are: Electrolytic, 16@16½c.; Lake 16@16½c.; casting, 15¾@16¼c.

The Philadelphia Traction Company has declared a semi-annual dividend of $2, payable October 2.

J. G. White & Co. recently took over the management of the Helena (Mont.) Light & Traction Company.

Books of the Philadelphia Electric gold trust certificates will close September 15 and reopen October 2.

A rumor comes from Milwaukee that E. C. Converse, of New York, will become president of the Allis-Chalmers Company in the near future.

The wreck on the Manhattan Elevated has had, so far, but little effect on Interborough stock. It sold at 215½ on Monday against 215@218 quoted at Saturday's close.

A dividend of 2½ per cent. has been declared on the preferred stock of the Union Traction Company of Indianapolis, Ind., payable October 2 to stock registered September 25.

The Twin City Rapid Transit Company (Minneapolis) has declared the regular quarterly dividend of 1¾ per cent. on its preferred stock, payable October 2 to stock registered September 16.

In answer to reports recently circulated that the railway lines and lighting systems of Manila were about to be sold it is stated by a representative that J. G. White & Co. still control the system and had no intention of selling it.

G. Martin Brill, head of the new combination of street car builders, has caused a change in the financial plan of that company regarding the $2,000,000 working capital. The first plan was to hold $2,000,000 of 5 per cent. bonds, but now it has been decided to sell them at once.

The August earnings of the United Railways Company of St. Louis, Mo., will show a heavy increase over 1904 and will far exceed the July gross receipts of $725,000. An officer of the company estimates that the returns for the past month should be in the neighborhood of $750,000.

A syndicate of California and Eastern interests has signed a preliminary agreement for the purchase of the stocks of the San Francisco Gas & Electric Company and the California Gas & Electric Corporation. A new corporation is to be organized to take over the stock of the two companies.

The Brooklyn Rapid Transit Company made public its report on Saturday for the year ended June 30 last, showing the largest gross earnings in the history of the company. The amount so earned was $16,333,444, which compares with $14,738,700 last year and $13,280,321 in 1903. The departments which showed the greatest increase in gross receipts were freight, mail and express, which gained 72.59 per cent. over last year.

The final report of the Citizens' Savings & Trust Company of Cleveland, O., as receiver of the Lake Shore Electric Railroad Company, has been filed in the United States Circuit Court at Cleveland. The receiver asks that he be discharged and the receivership discontinued. The report shows that $968,262 has been disbursed by the receiver in accordance with the order of the court. The receiver turns over to the company $800,000 over and above all claims. The Lake Shore Electric Railroad was one of the Everett-Moore Syndicate properties and was put into receivership at the time of the syndicate's financial embarrassment three years ago.

ELECTRICITY.

VOL. XXIX. NEW YORK, SEPTEMBER 20, 1905. NO. 12.

ELECTRICITY.

Published every Wednesday by the
ELECTRICITY NEWSPAPER COMPANY.

Publication Office, - - 136 Liberty St., New York.
Long Distance Telephone, 4021 Cortlandt

SUBSCRIPTION RATES:
United States, Canada and Mexico..$1.00
Foreign Countries.................... .. 3.00
Single Copies........ ....10 cents
Remit by Draft, Post Office Order, Registered Letter or in Stamps.

Owing to the expense involved in keeping back numbers, papers over two years old will be charged for at the rate of 25 cents apiece.

ADVERTISING RATES.

As ELECTRICITY reaches all classes interested in electrical work, its value as an advertising medium can be readily understood. Rates will be sent on application.

Changes of advertisements should reach the office not later than Saturday morning preceding the day of publication.

Entered at the New York Post Office as second-class mail matter.

EDITORIAL NOTES.

"Electricity's" New Educational Series.

A series of articles have been recently completed in the columns of ELECTRICITY, which touched upon every department of applied electricity, from the beginning to the end. This birds's-eye-view of the science and practice comprised more than a mere sketch of each individual field of work. In all cases the subject was thoroughly treated, and the results given in a simple and readily comprehensible manner. The supply of copies containing these articles were rapidly exhausted, and, although it was gratifying to ELECTRICITY, to find how great an interest has been taken in the ELECTRICITY Leaflets, it was embarrassing to find how low its stock of reserve copies had fallen in consequence. For this reason we are about to publish a new series of articles from the pen of Mr. Newton Harrison, which will cover the field of Light, Heat and Power. The letters of commendation, and the attention awakened by the last series, we expect, will be more than duplicated in this new instance.

In the last series, the enormous field to be covered gave little opportunity to other than outline the fundamental principles of application and development of electricity in the last century. The new series, however, will embrace the specific subjects of Light, Heat and Power exclusively. The articles composing it will be written in a simple, readable manner, and, without being unduly didactic, will touch upon the underlying principles, and such of the past and present practices, as will suffice to make the reader feel thoroughly in touch with the progress made in these departments of electrical engineering.

At the present writing, when text books are being turned out wholesale, it is hard to realize that of them all few reach that position of authority in the public mind which makes of them productions of value. The difficulty arises through the old-fashioned plan of treating subjects in the same humdrum manner. Of this the public are aware, and they therefore turn more and more to the columns of standard publications for the information they seek. This new series by Newton Harrison, E. E., will be readily recognized, as belonging to that class of easy reading articles, which while presenting technical and scientific facts, does so in a manner requiring no extensive preliminary training to comprehend.

ELECTRICITY offers this new opportunity to its readers in its next issue, believing that before the series is completed they will admit that if anything the high standard spoken of reached far above their expectations.

* * *

Electric Power Supply in South Africa.

The proposal that the great Victoria Falls on the Zambesi should be utilized, after the manner of the Niagara Falls, in connection with the development of the mining, railway and other works in South Africa and Rhodesia, has been brought up time and time again during say, the last 10 to 15 years, as the frequent references to the subject in ELECTRICITY have shown. In fact, ever since Prof. George Forbes went out at the command of the late Cecil Rhodes, to investigate the idea and report upon its practical possibilities, it has been alternately revived and dropped.

At the present moment, however, it has reached a more advanced stage than on any previous occasion when it has been under consideration, among other evidences in that direction being the visit of special commissioners to Niagara to collect data for the guidance of those who have obtained the Victoria Falls concessions from the chartered company. The meetings of the British Association for the Advancement of Science may also be said to have carried the scheme still one step more, nearer to actual realization. Although for the most part the Association's meeting has been one gigantic picnic it has enabled some of the leading electrical engineering minds to be brought to bear upon electric power development on the spot, and the discussion which took place with such an assembly of distinguished scientists and engineers in their midst, has probably done more to urge upon the attention of the Rand mining engineer and manager what are the benefits following the use of electric driving, than any little discussions that may take place from time to time at local gatherings of South African societies. Publicity—abundant publicity—we all know, has a large part to play in bringing about big reforms of any kind, and the publicity which has been accorded to all of the doings and discussions of the British Association while in South Africa has been unparalleled in generosity. All of this must needs tell, and as evolutionary processes do not permit any man "to bathe in the same river twice," so South Africa will not be the same after the English scientists and engineers have packed their trunks and returned home as it was before.

The question of electric power distribution on the Rand was the subject of two lectures or papers read at Johannesburg at the end of August by Prof. W. E. Ayrton, F R.S., and Mr. Robert Hammond, and both were discussed together. Prof. Ayrton referred to the commercial success achieved by electric power distribution in both Europe and America, and dealt with the question which is sometimes raised as to whether there is the same scope for an industrial revolution in South Africa. The answer at first sight, he said, would be "No!" Seeing that the map wss blackened with coalfields, some of which were reported to be producing coal nearly equal to the best Welsh, but on the other hand they had to consider the experience of South Wales and Tyneside where large use was now being made of electric power. The possibilities of electrical utilization at Victoria Falls were enormous, but he urged safeguarding the beauty of the Falls—a convenient position and location for a power station would be at the end of the second gorge. It would not be wise to start by constructing a transmission line from the Falls to Johannesburg, though it was quite workable, and he advocated electric transmission of power, but there was not yet sufficient demand for power along the line of route.

Mr. Robert Hammond whose lighting station offspring in the United Kingdom is like the promised seed of Abraham "like the sands of the sea shore" for number, in his paper, confirmed the remark of Professor Ayrton, that there are no engineering difficulties in the way of supplying electrical energy to all the mines on the Rand from a central power house utilizing the Falls, but in his opinion the cost thereby would far outweigh the annual outlay on coals. He unfolded before his hearers a more economical scheme for distributing power by burning coal nearer the Rand, by means of which power might be supplied at the rate of one and one-half cents per unit, which would make it far more economical than continuing to use steam power.

It seems that in this view Mr. Robert Hammond was not without supporters, though Mr. Alexander Siemens contended that by utilizing the Falls they would get the energy at any rate quite as cheaply.

It is to be hoped that this discussion will immediately extend the adoption of electric power in South Africa. Or if not, it cannot but be as "bread cast upon the waters"—returning later.

UNDER THE SEARCHLIGHT.

Notes and Comments on Various Topics.

An extensive American electric traction and lighting system is about to be constructed in the city of Para, Brazil, the commercial center of the Amazon Valley.

In connection with the annual convention of the American Street Railway Association, which is to be held in Philadelphia next week, will be an exhibition of the latest appliances in street railway traction, including cars, motors, dynamos, trucks, registers, air brakes and all kinds of electric machinery, which are in use in a complete railway system.

Japanese dock yards, factories and other works are calling for labor-saving machines very freely. So far American manufacturers of such have benefited largely, but there are a good many orders yet to be got. American electrical machinery is particularly popular.

The Great Northern Telegraph Company of Copenhagen has obtained a license for laying out and operating a submarine cable to Iceland. The cable is to be laid from the Shetland Islands, off the north coast of Scotland.

The wireless block system now being used on the Alton Railway is proving successful, and all locomotives are being equipped with it.

The Erie Railroad Company has arranged for the immediate expenditure of $225,000 for the installation of the Hall Electric Semaphore Normal Clear System, operated by stationary storage batteries.

The new high-speed electric line to Jamestown, N. Y., is being tested. The line is said to have cost nearly $1,000,000.

An economical method of using up arc lamp carbon ends is described by L. Bernard in the "Elektrotechnische Zeitschrift." It consists, says the "Electrical Engineer," London, in cementing several ends together so as to form a single long carbon. The cementing is carried out by cutting the ends of the pieces so as to allow them to fit together, covering these ends with a paste made of water glass and powdered carbon, and then lightly pressing the pieces together. Such made-up carbons were found to be satisfactory in every way. They burnt, both with direct and alternating currents just as well as new carbons, even at the junctures. Tests proved that the resistance was but little greater than that of new carbons, whilst as regards mechanical strength the made-up carbons, when subjected to a uniform stress, were found, if anything, more liable to break between joints than at the joints.

According to the "Electrician," London, the Allgemeine Elektricitats-Gesellschaft of Berlin, is putting on the market wires and conductors for electrical purposes with a new kind of insulation claimed to be superior electrically and mechanically to silk-insulated wires. The new insulating material is a special chemical compound which is distributed evenly and in many thin layers, on the wire by special machinery. It is stated that the covering is only about 0.02 mm. (0.0008 inch) thick, is non hygroscopic and is unaffected by temperatures up to 150 degs. C., being at the same time strong and elastic. A thickness of 0.02 mm., it is said, will withstand, on an average, 1,500 volts without breaking down.

CALIFORNIA ELECTRIC PLANT OF THE MONTEREY COUNTY GAS AND ELECTRIC COMPANY.

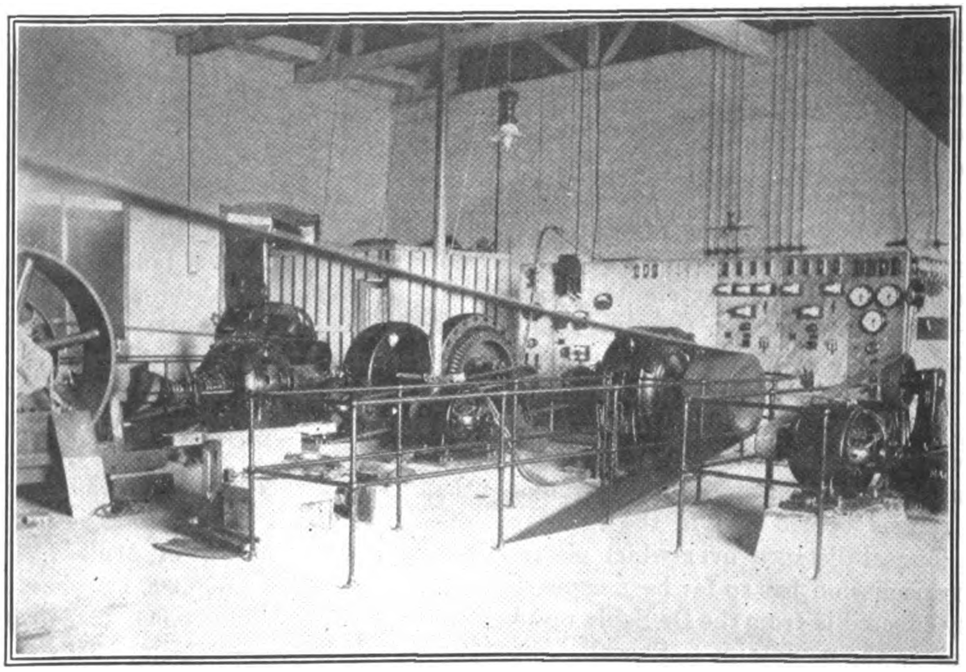
BY FRANK C. PERKINS.

In America as well as in Europe the various gas and electric companies are finding it to their advantage to consolidate, and in many places gas companies are installing electric light plants of their own, in some cases operated by gas engines and in others by steam engines. The Monterey County Gas & Electric Company of Monterey, Cal., is a successor to the Salinas Water, Light & Power Company, the Salinas City Light & Water Company, and the Monterey Electric Light & Development Company. Waterworks Companies are now often consolidated with the light and gas companies, the pumps being operated by electric power or by gas engines, power distribution by electric current, and lighting by gas and electric distribution. The waterworks and steam electric plant at Salinas include pumps driven by gas engines of the White and Middleton type, and National and General Electric alternators of the single phase type, operating at a pressure of 1,040 volts, driven by a Columbian Corliss engine of 16-inch stroke with cylinder 42 inches in diameter, the same engine being so arranged as to operate the triplex pump in case of necessity caused by a breakdown. In the same building is a modern gas plant supplying water gas made from crude oil.

The gas electric and street railway plants supplying service to Monterey, New Monterey and Pacific Grove, are owned by the Monterey Gas & Electric Company. The steam electric plant at Monterey is installed in a corrugated iron building 52 feet wide and 143 feet long, the engine room of which is shown in the accompanying illustration, the gas works being located in the rear and having a length of 66 feet.

The boiler plant includes three Murray return tubular boilers of 150 hp. each operating at a pressure of 150 lbs. per square inch. These boilers are supplied with a fuel of crude oil which is pumped from a tank 24 feet wide and 7 feet deep, the oil being pumped directly into this tank from the oil tank cars placed on the siding opposite the power house. In order to easily pump the oil from the car tanks steam is passed into heating coils off the tank car and the vicosity of the oil being reduced, two Stillwell-Bierce pumps force the oil to the storage tank through a Worthington meter, one pump being held in reserve. The oil used has a gravity of about 15 degrees Beaume, and costs about 76 cents per barrel of 42 gallons.

There are four engines of from 150 to 250 hp. capacity of the Buckeye, Weatherill-Corliss, Nagle-Corliss, and Lane and Bodley-Corliss types operating at 175, 94, 108 and 98 r.p.m. respectively. These engines are connected by belt transmission to General Electric and National two-phase alternators and direct current machines of from 150 to 200 kilowatts capacity each. The alternators supply a two-phase current of 2,300 volts pressure and the direct current machines supply a continuous current of 550 volts for railway service. A National motor generator set is also installed consisting of a 550 volt railway generator, of 150 kilowatts capacity, directly driven by a revolving field synchronous motor with a rating of 162 kilowatts, operating at a speed of 720 r.p.m. Between the motor and the generator is a 22 inch pulley with a 16 inch face belted to the 200 hp. high speed Buckeye engine flywheel. By this arrangement both the units of the motor generator may be operated as direct and alternating current dynamos, and affords a link by means of which the two-phase lead may be coupled with the railway load allowing a day alternating current service to be maintained in connection with the railway load with a maximum efficiency of operation.



Monterey's Gas and Electric Plant.

The Monterey Gas Works is equipped with apparatus installed by the California Light & Fuel Company and includes a scrubber and scrubber-condenser as well as superheater, washer and generator. At the Monterey gas works salt water is used for gas making, while at Salinas fresh water is employed. During one month of 1904 more than 500,000 cubic feet of gas was made, the average amount of oil used being a trifle over 210 gallons per day, the average gas made being 17,000 cubic feet per day, this being an average of about 12 gallons of oil per 1,000 cubic feet of gas made.

THE COMMERCIAL VALUE OF OUR WATERFALLS.

BY GEORGE ETHELBERT WALSH.

Engineering developments in the past decade have given a new value to waterfalls and mountain streams, which is rapidly shifting the industrial centers of the country, and changing topographical conditions in a remarkable way. When Niagara was first harnessed the transmission of electrical energy any great distance for commercial purposes was considered of doubtful expediency, and as a direct result of its exploitation groups of new industries sprang up around Niagara to utilize the electrical current for manufacturing and experimental purposes. But since then the practical transmission of current over long distances has progressed so rapidly that industrial sites are no longer limited to restricted areas dependent upon the proximity of powerful waterfalls or streams. Instead of the manufacturing towns and cities of the coast going to the mountain streams and waterfalls, the latter are sending their energy over scores of miles of copper wire to the mills and factories of our seaports.

The value of a waterfall or stream for electrical purposes depends fully as much upon the market for the current as upon its power to generate current at little cost. There are scores and hundreds of streams in this country with high water heads which have not been developed for electrical purposes because of their inaccessible location. In the Rocky Mountain sections there are many streams from 1 to 10,000 feet above the sea level. With such tremendous heads the waters of even a small stream could be made to turn giant turbines and furnish electrical power sufficient to operate the cars and factories of whole towns and cities. When it is remembered that the fall of one cubic foot of water per second through a height of 100 feet develops 11.2 hp., a slight conception of the value of a mountain stream with a 10,000 feet head can be realized. Even though such a stream was little more than a brook, the water conducted down a flume to the valley 10,000 feet below would be powerful enough to turn the largest set of turbines ever built.

Owing to the scarcity of coal as fuel on the Pacific coast, electrical engineers sought to draw energy from water power high up in the mountains, and they have developed long-distance transmission of electricity to a point where geographical conditions have suddenly lost much of their meaning. The Pacific coast cities are drawing their power, heat and light from the Sierra Nevada and other mountain ranges located back in the interior. The longest distance over which electrical transmission has so far been commercially effected is from the De Sabla power house in the mountains to Sausalito, opposite San Francisco, a total distance of 232 miles. Another line, 142 miles long, runs from Colgate power house on the Yuba River to San Francisco, carrying current for miscellaneous use. A third line, beginning at the generating power plant at Electra in the Sierra Nevada Mountains, delivers daily 10,000 hp. in San Francisco, 154 miles distant. Electrical power used in Los Angeles is drawn from a power house on the Santa Ana River and Mill Creek, over 83 miles back from the coast. At the Mill Creek power house the head of water is nearly 2,000 feet. Mill Creek is a small stream, and its supply of water would appear to the casual visitor of no commercial value, not even though it flowed close to the suburbs of a city. Yet by virtue of its altitude it is made to perform feats little less marvelous than those which we are accustomed to read about in the Arabian Night stories. A single cubic foot of water from this Mill Creek conducted down the long flume is capable of developing 117,800 foot pounds or 214 hp. per second. Added to this remarkable fact is the no less important one that it delivers the power to mills and factories situated 83 miles away. Here a single cubic foot of water, perched high upon a mountain range, 83 miles back from the coast, is made to do the work of powerful steam engines working continuously on the scene at a considerable expense in coal consumption.

The value of a waterfall to-day is measured not only by its volume, or by its location near large cities or manufacturing centers, but by its water-head. The small waterfalls situated at great heights may furnish more power than the sluggish river ten times as broad and deep. The cost of harnessing a small mountain stream is proportionally less than that of a Niagara, whose power is so great that it is difficult to separate a portion of it for commercial uses. The mountain streams of California are tapped by wooden flumes, which carry the water long distances down the sides of the mountains to the power house. So powerful is the flow of water at the generating house that the largest and heaviest turbines must be built to utilize it.

No one has yet been able to measure the actual or potential power of Niagara, but it is assumed by electrical engineers that some 4,000,000 hp. could be developed from it before the total energy of the cataract would all be utilized. The annual profits on 4,000,000 hp. should be anywhere from $20,000,000 to $40,000,000 at the lowest estimate. This would represent fair interest on something like a billion dollars. So for the sake of argument it may be assumed that Niagara, as a power-producer, is a property worth approximately a billion or more dollars. This value could, however, only be attained through the long-distance transmission of electric current for use in towns and cities hundreds of miles from the falls. The actual tangible value of the cataract is dependent upon the market for the current, and this can be obtained only by the widening of the circle of consumers by long-distance systems.

There are several smaller streams which have as high a water head as Niagara, and the water—cubic foot for cubic foot—is worth as much for power development as that which tumbles over the cataract made famous in history and science. The water at the great Spiers Falls on the Upper Hudson has a head of 80 feet, and it delivers over 30,000 hp. to Albany and other distant cities. In Montana the Canon Ferry power house on the Missouri receives its water from a fall 30 feet high, and the water-wheels develop power to supply the city of Butte 65 miles away with all the electrical energy it needs.

With these striking examples of the practical value of waterfalls and high streams before us, it is easy to assume that the country's wealth in water power is unfailing and far reaching in effect. There is no longer a fear of a fuel famine. With our waterfalls and streams all harnessed so that their full energy could be used, the light, heat and power generated therefrom would be sufficient to make us comfortable for the rest of our existence on this planet. Within a few years such mighty transmission of power, heat and light could be effected that the total exhaustion of our coal mines would have only a temporary crippling effect upon our industries. The readjustment is in a fair way of progress to-day. Scores and hundreds of large and small streams of water are being developed for generating electric power and mills and factories are drawing their supplies of energy from distant streams in all parts of the country.

In the Central, Southern and New England States, the water courses have an average altitude above the sea level sufficient to make them of great commercial value. A stream 500 feet above sea level is a mammoth power producer—potential, it is true, but nevertheless real and actual. Such streams flow through New England in many places only a dozen or two miles back from the coast cities. Others at an altitude of 1,000 to 1,500 feet above the sea level waste more power than is needed to run nearly all of New England's cotton, shoe and button mills. It was impracticable to transport the mills and factories to the inland waterfalls, but to-day the energy generated can be transmitted to the mills and factories on their old sites.

The harnessing of small streams in series is one of the important developments of modern methods of long-distance transmission of electric energy. A State or section abounding in numerous small streams with fair water head no longer may be considered outside the boundary of hydraulic development. Each small stream is considered as a single unit in a series of water power plants. Streams that have a fall of only a few feet per mile can be utilized at different points along their course for generating power that can be sent scores of miles away to turn the wheels of factories and mills. In New England where small streams are very numerous electrical transmission systems have been built up within the past few years by joining the power of many small units into one gigantic line that carries the energy long distances. The industries which have centralized in certain cities along the coast thus draw their power from the insignificant inland streams whose waters for ages have been wasted. Many of the old water-wheel mills that were abandoned years ago, because manufacturers moved away from them, are being revived now to form links in the electrical chain that connects the mountains with the seashore. The cotton mills of New England which built up their industry from coal and hydraulic power are changing to electricity.

In the summer time the streams which turned the water wheels of the cotton mills would dry up so that the mills either had to shut down or use auxiliary steam plants. This difference in the water flow in summer and winter is one of the problems which the modern electrical engineer has to consider carefully. The fall is so great some times that the water wheels are left high and dry above it. The Connecticut River, for instance, shows a mean discharge of 16,314 cubic feet per second in one month, and drops to 3,453 cubic feet in late mid-summer. Even more pronounced is the fall in dry weather of some of the smaller streams. A few of the New England streams show wide variation in the amount of water within the same month. The Androscoggin River in Maine has changed within 30 days from a maximum discharge of 18,486 cubic feet per second to 3,165 feet. The control of the waters of such streams is obtained only through the construction of reservoirs or dams, which will hold the waste water of winter and spring for summer and fall use. Small streams with a high head can be converted into powerful electrical units for a transmission line by damming them up so that the surplus water is not allowed to run to waste.

The New England cotton mills will soon draw nearly all their power from the distant inland streams where electricity can be generated the year around at little expense. The necessity of this is felt by competition with the Southern cotton mills, which have already entered largely into the use of hydro-electrical power. At Fayetteville, N. C., a dam 1,500 feet long has been built to back up the water for 12 miles to run the cotton mills located along the course. Numerous turbines are installed to receive the water for generating electricity to operate the looms and spindles of the factories. The water supply will thus be made constant the year round, and the summer "shut-down" for lack of water will no longer throw the mills out of use. In New England a similar example is found in the cotton mills on the Blackstone River where 1,500 hp. is delivered in the winter and 600 in summer, with an average the year round of 1,000 hp., but by the construction of a reservoir this amount can be augmented as needed to almost any amount of horse power. At Columbia, S. C., a dozen cotton mills have been drawing upon electrical energy generated by streams for their operation. They have entered upon a period of activity which takes no account of winter or summer, of dry or wet seasons. The electric power is sufficient for all needs every month in the year.

The question of the commercial limit of electrical transmission is now of paramount interest to the country, and particularly in those parts where great hydro-electric power seems unlimited. Long before the Pacific coast engineers carried their energy from the mountains to the coast, is was considered inexpedient and unprofitable to transmit electrical energy in bulk 50 or 100 miles. Length, cost of conductors and insulators are factors that enter into the problem. When 60,000 volts are sent over a line the cost of insulators becomes almost prohibitive. In order to send a current a hundred miles or more the consumption of energy is large, and there may be a point where further transmission would prove impossible or at least commercially unprofitable. In the long distance transmission systems of California several power houses are used, each drawing its energy from different water sources, or at differet points on the stream. Thus the longest transmission line from the Sierra Nevada has five power houses, and the Los Angeles system has three. It is by combining small units along the way into one great system that the best long-distance transmission service is obtained, and the country cut up by numerous little streams has really an advantage over another with only one or two great cataracts.

The limits of long-distance transmission cannot thus be arbitrarily fixed. The distribution of the energy may grow in time into one wide, complex system, drawing its energy from numerous sources, and supplying power as needed hundreds of miles away from the first beginning of the plant. This may be called the period of consolidation and centralization of water power and electrical energy.

The commercial limits of long-distance transmission of electrical energy must be determined by the cost of fuel in the districts through which the lines pass. We have some notable instances of where electrical energy is supplied to distant cities at less cost than it can be generated by coal on the spot. In spite of the low cost of coal in Buffalo, the Niagara Company can deliver and sell profitably some 20,000 kilowatts of electrical energy to the city, and in Montreal, with coal at $3 per ton, electricity is brought from the Shawinigan Falls to displace steam engines on a large scale. The city of St. Paul likewise uses large amounts of electricity transmitted over a line 25 miles long, although coal and other fuel is very reasonable in cost. On the California coast, the long-distance electrical transmission companies have to compete with a fuel even cheaper than coal on our Atlantic coast. California oil has supplanted coal almost completely for power development in mills, shops and railroads. With liquid fuel ranging from 65 cents to $1 per barrel, coal has no chance for general power development; but in spite of this electricity comes from the distant Sierra Nevada Mountains and openly competes with electrical power plants operated by liquid fuel.

Albany, Troy and Schenectady are on the line of the Erie Canal and great trunk railroads; but the fuel problem with them has not interfered with the building up of a great group or combination of electrical transmission systems which draw their power from waterfalls 30 to 40 miles away. The long-distance electrical transmission has no arbitrary limits, and its future developments must depend upon conditions governing the cost of delivery to different points and the price of fuel. Unless the distant market, however, is large enough to consume considerable current it hardly pays to attempt to supply it. At present the large. electrical groups drawing their power from waterfalls and streams are able to find ready markets for all the current they can generate, and with the growth of the cities supplied it is more a question of increasing their output to keep pace with the developments of industries than to find new distant markets.

Electric Meter Testing.

In the absence of any appropriation with which to establish an electric meter-testing station in New York City, Commissioner Oakley has reached a tentative agreement by which all such meters may be examined at Columbia University. The university will maintain the station and furnish the necessary apparatus if the city will pay half the inspector's salary.

THE MAINTENANCE OF COMMUTATORS AND BRUSHES.*

BY S. LEES.

The subject of the following article may appear, perhaps, to some readers to be rather simple and uninteresting, but it is, nevertheless, a most important one to which too much attention cannot be given if the maximum efficiency and economy in the running of direct-current machinery is to be obtained with the minimum of expense. Even in these enlightened days, there are many central stations of large size (the writer speaks from actual experience) where, while money is literally thrown away on expensive test-room equipments—potentiometers, with their numerous adjuncts, photometers, balances, etc., in fact, no end of standard instruments of various kinds—it is considered quite unnecessary to provide anything in the way of tools for the cleaning and truing up of the commutators.

Formerly, it was usual when a commutator had been allowed to get into such a bad state that running was impossible unless accompanied by a fine display of pyrotechnics, to tide matters over by putting a file on the commutator; as, with many of the older types of machines it was an impossibility to rig up a slide rest and skim up the commutator in position, and to take out an armature of four or five tons weight was often no easy matter—the lay-out of the plant in some of the older stations left much to be desired these things being understood better at the present day—to say nothing of the inconvenience caused through the armature having to be sent to some shop to be turned up, as very few of the stations of 10 or 15 years ago enjoyed the luxury of a lathe.

Nowadays there is no excuse for treating commutators in this barbarous manner, although some engineers still stick to the idea that the presence of slight flats does not necessitate the truing up of the whole commutator. That this idea is quite erroneous may be easily proved by carefully calipering the commutator after the flats have been filed out. The small flats have been removed only to give way to larger ones, thus leaving the whole surface of the commutator very uneven, aggravating sparking by causing the brushes to jump, and resulting in increased wear of both the commutator and brushes.

The writer recalls an experience he encountered about eight years ago at a large electricity works in Yorkshire. The commutators of nearly all the generators (some 17 in number, varying in size from 150 kw. to 600 kw.) were in a very bad state, and one of the writer's first jobs on first taking up duties was the truing up (by file) of the commutators of two of the 150 kw. sets. The machines were of the bipolar type, having three copper gauze brushes to each holder. The brushes of dissimilar polarity had been placed exactly in a line with each other, owing to which the commutator had become worn down in the form of three grooves, the flanges thereto standing up about ¼ in. all round from the rest of the commutator. The sets were direct-coupled, and, viewed from the machine end, ran counter-clockwise, rendering the filing nearly all left-hand work. The works did not boast a lathe, and the machines could not be spared out of service long enough to allow of the armatures being sent away.

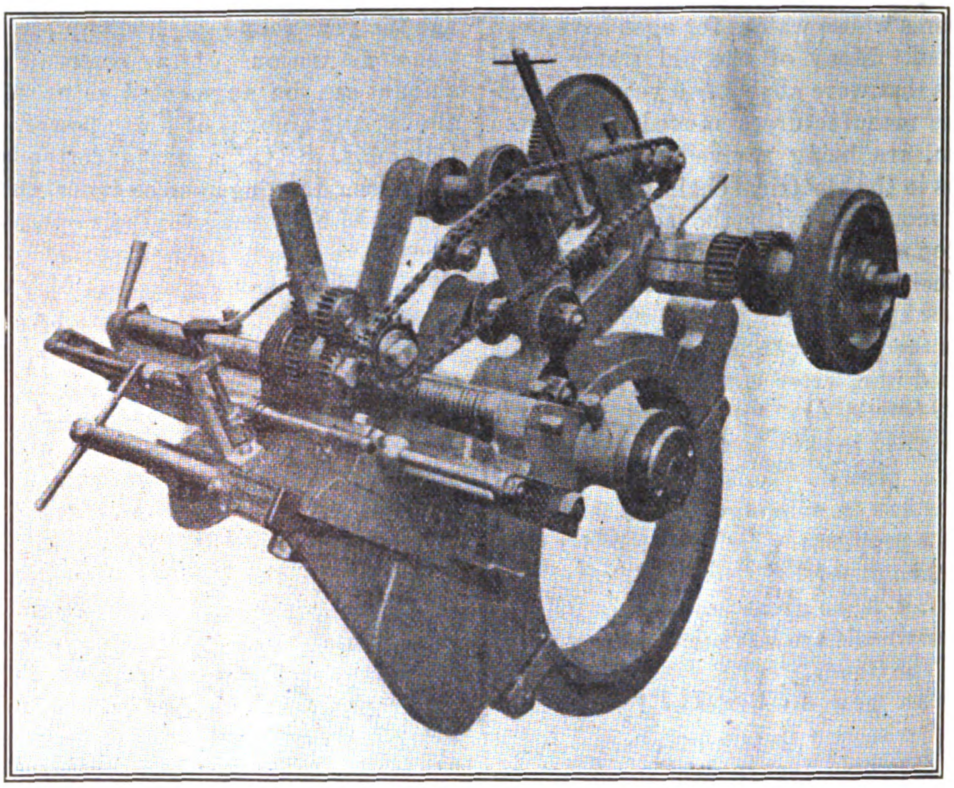


FIG. 1.

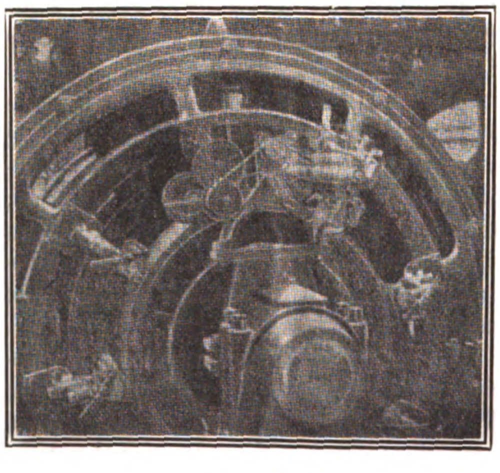

FIG. 2.

Of the two methods of truing up commutators—viz., turning and grinding—the writer is of opinion that, taken all round, grinding makes the most satisfactory job. In order to get the best results by turning, the operator requires to have a thorough working knowledge of turning, and the writer's experience has taught him that a really good mechanic is the exception rather than the rule in most installations, not excepting even central stations. Where possible, it is preferable to true up the commutator in position. Hard-drawn copper as used for commutator bars is queer stuff to work, and as the bars have a tendency to spring when passing under the tool the cutting speed should not exceed about 90 feet per minute. With high-speed direct-coupled sets having engines of the two-crank type—particularly single-acting engines—it is sometimes a rather difficult matter to get even turning at these low rates of speed. A tool-holder to take tool steel of V section is very suitable for commutator work, as, in case of breakage, grinding only is required. Light cuts should be taken as the tool is liable to dig in. After the finishing cut is taken the speed may be increased slightly, and a file run over the commutator. Before finally polishing with emery cloth the commutator should be carefully examined all over and any metal which may be found bridging across the mica insulation between the segments carefully removed. The final polishing is best done with a special tool as described later on.

---

*From the "Electrical Engineer," London.

There are two types of commutator grinding machines—viz, (1) driven direct from the commutator to be trued up, (2) driven by belt from separate source, usually a small motor. Figs. 1 and 2, illustrative of type 1, represent the grinding machine of the Phillips Commutator Grinder Company, Limited, of London. Fig. 1 is a general view of an automatic machine having a clamp arrangement for fixing round the brush-rocker journal. Where no rockers are used the same machine can be fixed round the nose of the outer bearing. Distance rings of different sizes are used when necessary to fit various sizes of rockers. When inconvenient the bottom half ring is dispensed with, and the machine is bolted to arms supported from the cover bolts, and when the diameter of the commutator is extra large the arms are raised by means of distance pieces, or they are bolted to the platform of a casting clamped round the nose of the bearing, as illustrated in Fig. 2. The Phillips light hand-feed machine, which is used chiefly for small dynamos (exciters, boosters, etc.), is made to true-up commutators from 3 inch to 9 inch diameter and 6 inch wide (across face). The heavier hand-feed machine is made stronger to carry longer slides to true-up commutators from 6 inch to 12 inch diameter to 10 inch wide. This type of machine is specially suitable for dynamos on board ship (but they can be used otherwise), which, as a rule, are erected close to the bulkheads, allowing but little room for working. In working the grinding spindle is driven direct by means of a specially prepared rubber friction wheel running on the commutator. The grinding wheel moves to and fro across the face of the commutator, and in all except the hand-fed machines is automatically reversed at each end, being so constructed that stops can be set as in a planing machine, grinding the surface right up to the connecting wires and back to the edge. The grinding wheel should, of course, run in the opposite direction to the commutator.

A commutator truing machine possessing some novel features has recently been placed on the market by Jordan Brothers, of New York, U. S. A. It is of the direct-driven type, the grinding wheel spindle being driven by means of a round belt passing round the commutator or armature shaft. The grinding wheel spindle is slotted to allow of lateral movement of the wheel across the face of the commutator. The feed is controlled by hand, the depth of cut being set by means of an eccentric gear. The grinding wheel is specially made for commutator work, as it is claimed that no substance which would be injurious to commutators enters into its composition. The machine is provided with suitable clamps for affixing to the rocker journal or framework of the generator or motor.

Fig. 3 is illustrative of type 2. The emery wheel, A, is fixed on the shaft, B, which is carried by the bearings, C C, supported on the standards, D^1 D^2. The standard, D^1, is provided with a V slide on which it may be traversed across the bar, E, to suit different depths of cut. The base of the slide is carried by the sleeve, F, on which is formed a half nut, G, engaging the screwed end of the rod, H. A handle is fitted to rod H, by means of which the wheel A, can be traversed along the commutator in either direction. The shaft, B, is slotted at M to enable it to travel through the bearing, C, and driving pulley, O; and the bearing standards, D^1 D^2, are telescopic, so as to admit of vertical adjustment for different heights of commutators. In the sketch the machine is shown fixed to the bedplate of the dynamo by an adjustable clamp, P.

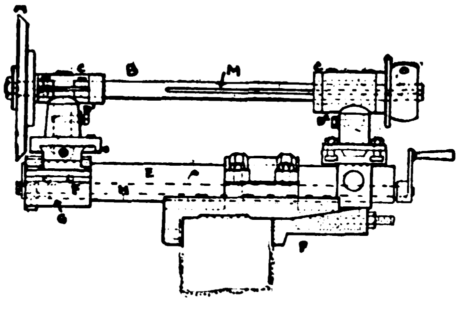

Fig. 3.

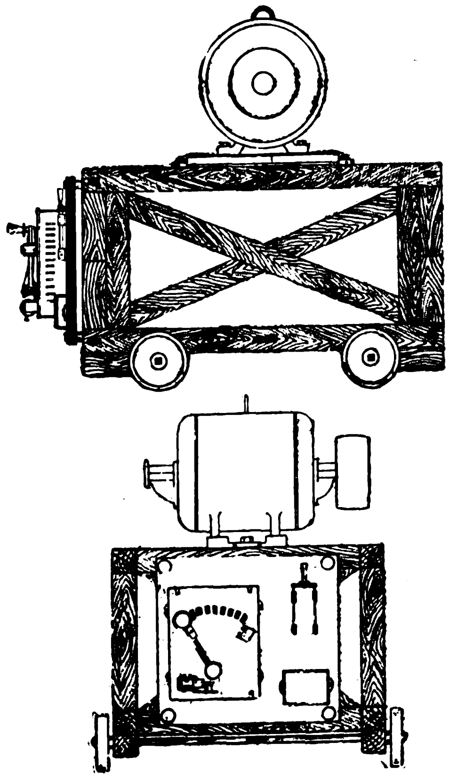

Fig. 4.

The writer experienced some little trouble in getting a satisfactory belt drive with this type of grinder, but finally got over the difficulty by mounting the driving motor, starting switch, etc., on a portable stand, as illustrated in Fig. 4. The framework is built up of 3 inch by 3 inch well-seasoned pitch pine, all joints being mortised and bolted together. The motor is of the protected type, giving 1 BHP., the starting switch being provided with overload and no voltage release coils. The details of the sketch may, perhaps, prove self-explanatory. The compactness and portability of the arrangment will be readily appreciated by anyone who has done much commutator truing, and its advantages over any other method where the driving motor, starter gear, etc., require fixing in position before using each time, are obvious.

(To be continued.)

BACK PRESSURE VALVES.

BY W. H. WAKEMAN.

The value of exhaust steam from engines and pumps for heating buildings, warming water, etc., is appreciated in many more places at the present time than it was a few years ago, but there is chance for missionary work along this line yet in scores of cases.

Exhaust steam is usually impure as it contains some of the oil used to lubricate the internal parts of the machines through which it passed, but it can be purified so that when it is condensed the resulting water is fit for making artificial ice.

Objections are often made to the back pressure usually caused by using the steam elsewhere, but these are not always well taken, because it is frequently unnecessary to cause much back pressure, and in many cases said back pressure does no harm and does not add to the cost of fuel necessary to operate the whole plant.

Wherever exhaust steam is used for useful purposes a back pressure valve should be installed, for it acts as a safety valve and prevents pressure from accumulating that would stop the engine, or damage the light pressure piping sometimes used for this service. There are several kinds of these valves and as their good qualities are not always understood by those who buy them for use under various conditions, a few questions along this line should prove both interesting and instructive.

Some time ago I visited a plant containing a fine Corliss engine, that was well cared for in every respect. The feed water heater was located in the engine room and above it was the back pressure valve. Everybody that came into the room was made aware of this fact by the noise it caused, for every time a puff of exhaust steam came from the engine, (which revolved at a low speed), the valve opened, and between the puffs it closed. It was not provided with a dash pot, or any other device for preventing this noise, hence it was a nuisance.

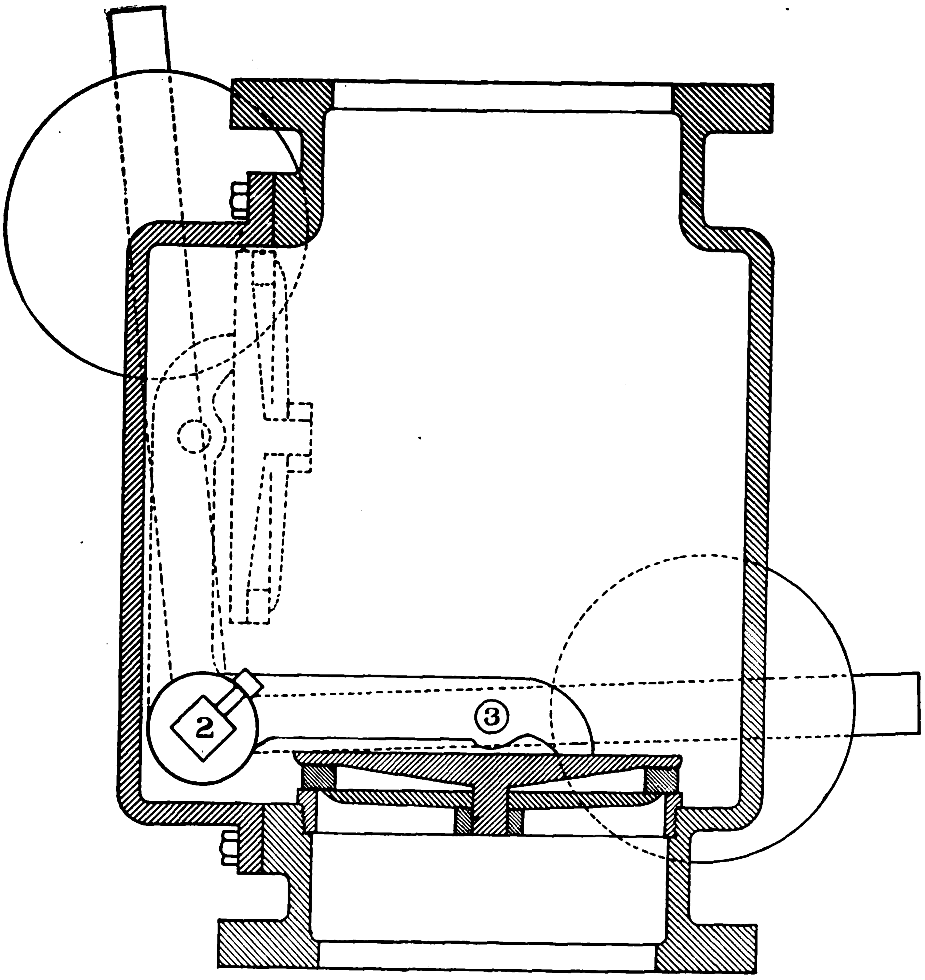

Fig. 1.

While installing an engine with necessary piping in another plant I took good care to specify that the back pressure valve should be noiseless in operation, and it proved so in practice, although the device for preventing it from pounding its seat was extremely simple. Just before the valve closed tight it trapped a small amount of steam which acted as a cushion, bringing the parts together quietly.

I have stated that back pressure is not always detrimental, but valves and exhaust piping ought to be designed so that when steam is discharged into the air as a waste product, it should escape with the least possible friction, for under these conditions back pressure is detrimental in every case.

Some of the back pressure valves in service at the present time can be raised from their seats but a very short distance, giving only a small passage for steam. The valve illustrated in Fig. 1 is in great contrast to this, for when open the cross section of opening is greater than for the straight pipe, consequently it can cause no friction. The full lines show the valve closed, while the dotted lines indicate its position when open. It should be noted that in every case the length of lever outside of the valve casing does not represent the actual leverage brought to bear on the valve. Referring to Fig. 1 the outside lever is hinged at 2 and the apparent length of it is from this point to the center of round weight. This is partially offset by the inside lever which extends from 2 to the center of valve at 3, therefore the real leverage is from 3 to the center of round weight.

This explains the necessity for having such a large and heavy weight on a valve of this kind, even when it is designed to open at a light pressure. When a heavy weight is located near the ceiling of an engine room, it seems to be a constant menace to all who pass by, therefore I have adopted the idea of using a small wire cable, by means of which the weight is located near the floor where it can do no harm if a set screw slips or a cast iron lever breaks.

Fig. 2 illustrates a valve requiring but a small weight to hold it closed against a reasonable pressure. This is due to the fact that pressure acts on two circular surfaces shown in elevation at 2 and 3. Steam entering from the left tends to raise 2 and at the same time presses downward on 3. If both were of the same size, the valve would remain closed even if a high pressure was brought to bear on it, but the greater area of 2 gives this an advantage over 3, consequently the valve lifts, but the weight, (not shown in the cut), is only required to be large enough to balance pressure acting on the difference in area between the two circular surfaces.

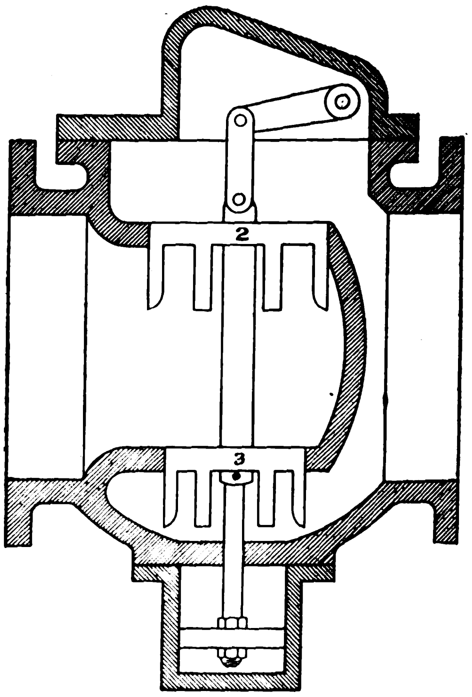

Fig. 2.

As this valve wears, it leaks because no means are provided for overcoming the trouble except to renew the internal movable parts, 2 and 3. When the stem is located in a vertical position as shown, the wear is very slight, for it is almost frictionless.

A dash pot is provided at the lower part into which a piston is loosely fitted. This soon fills with water and as the piston cannot move rapidly in either direction on this account, the valve is practically noiseless in operation.

Fig. 3 is a valve on which there is no external lever, hence no weight either large or small to be cared for. A spiral spring acts on the short arm of a bell crank lever, the long arm of which rests upon the top of valve as shown, or in other words the valve is held to its seat by a spring, the tension of which can be regulated by the set screw at the right hand side. The cut plainly shows the internal dash pot which prevents hammering and clattering as the engine discharges steam in puffs.

When a free exhaust pipe is wanted, the set screw at the left is screwed down, raising the valve from its seat and holding it there.

These three valves represent three principal types now in use, namely, those requiring a heavy weight, those which utilize a light weight and those controlled by springs. Of course the two former could be held in place by springs, but weights are used as a distinctive feature. There is another type in which a weight is used directly on the valve stem which projects through the bonnet for this purpose, thus making it a dead weight valve, but these are not used extensively, and for very light pressures only, therefore they are not included in this article. Those presented are practical types when used as illustrated and are mentioned for the purpose of calling attention to good valves for use wherever it is desired to produce pressure in the exhaust pipe of an engine, and yet provide means for the prevention of excessive pressure, provided all of the steam is used.

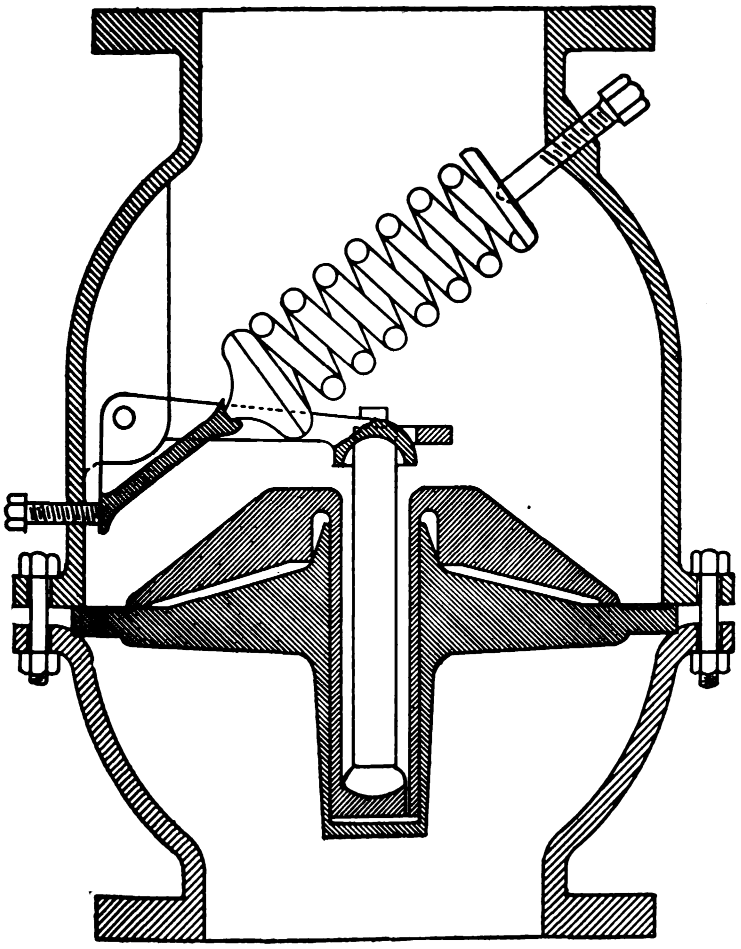

Fig. 3.

WRINKLES.*

EDITED BY H. C. ABELL.

A Method of Repairing Damaged Insulation Between Damaged Commutator Bars.

A commutator trouble that sometimes worries the operators of direct-current generators, and motors is a short-circuit between adjacent commutator bars, which gradually burns down deeply into the mica insulation, and ends eventually in a burn-out of a section of the armature winding. The trouble may disappear for a short time if the burned insulation is scraped away, but carbon dust from the brushes soon accumulates and bridges across from bar to bar, and the difficulty continues.

A permanent cure may be effected by digging out all the dirt and burned mica and filling the cavity with a thin paste composed of litharge and glycerine. The commutator should then be heated at this point with a soldering iron or blow torch, baking the paste to a hard compound, which can be filed off smooth and even with the commutator surface.

It is very essential to absolutely remove the short-circuit before applying the paste, and it is best to disconnect one of the bars from the armature winding and test across the insulation, using a voltmeter or incandescent lamp as an indicator. Holes three-quarters of an inch deep have given no trouble since receiving this treatment.

CLEVELAND ELECTRIC ILL. CO.

Protecting Standard Indicating Instruments.

Primary indicating standard instruments used for checking working standards on meter test racks are in one instance well protected from stray magnetic fields and from mechanical injury, by being supported each inside of an iron box over 30 inches square. The boxes are made of boiler plate, welded seam, top and bottom bolted tightly to side wall. A wooden partition horizontally through the box gives support for the instruments. Low-candle-power electric lamps, inside the boxes, light the instrument scales. A rectangular cardboard tube painted a dull black, extending from slightly over the instrument scale to a slot in the top of the box, eliminates reflection and protects the eyes of an observer from the rays of the lamps. The boxes are mounted on castors for ease in moving to switchboard type working standards to be checked.

CLEVELAND ELECTRIC ILL. CO.

Handy Galvanometer for Potentiometer Work.

For some time we were bothered to get a galvanometer for use with a potentiometer in a location where there was too much vibration for a D'Arsonval suspension galvanometer. The ordinary small pivot galvanometer was not sensitive enough for the work. We obtained a student's miscroscope, removed the mirror and table, and put an extension on so that the lenses could be brought over a pivot galvanometer. With this arrangement, which is always ready for use regardless of ordinary vibration, we can use the potentiometer for measurements to two-thousandths of one volt.

C. R. BROWN, BOSTON, MASS.

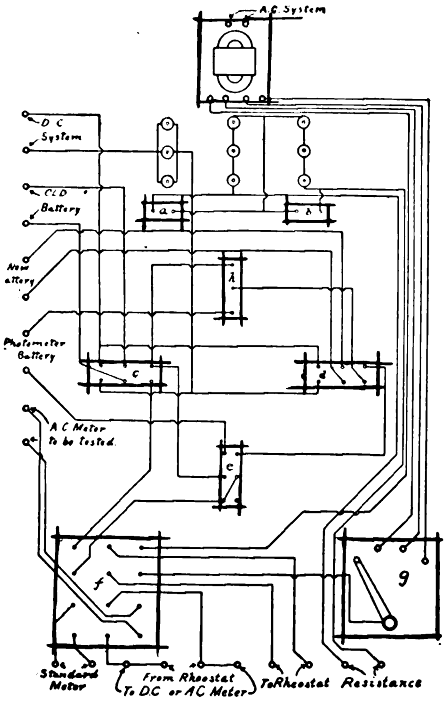
Switchboard for Voltmeter Testing.

The accompanying diagram shows the connections of a switchboard used in connection with voltmeter testing in the laboratory of the Edison Electric Illuminating Company, of Boston, which embodies several features that have proved very useful in facilitating rapid work.

Three batteries are used as shown on the left of the diagram. The posts labeled "D. C. system" are for a 220-volt charging circuit for two of the batteries. Double-pole, double-throw switches, c and d, when thrown to the left charge the "old battery" and "new battery," the other battery being charged from another board. When thrown to the right they put the batteries at the service of the operator. The two posts marked "standard meter" connect with a direct-current standard voltmeter; an alternating-current standard may be put in on the two posts marked "D. C. or A. C. meter." The posts marked "to rheostat" are connected to the outsides of two rheostats placed in series, one having a resistance of 1,500 ohms in 30 steps, and the other having a resistance of about 100 ohms in very small steps for fine regulation. The insides of these rheostats are connected to the posts marked "resistance," which, it will be noted, connect with switches a and b, so that three or six 16-cp, 110-volt lamps may be thrown in series with, and between, the two rheostats. The moving arms on the rheostats are connected to the posts marked "from rheostat." The switch g is connected to the potential transformer at the top of the board. This is fed from a 110-volt circuit, and the secondary taps give 150, 300 and 600 volts, respectively, from left to right as connected to g. Just below the transformer are three sets of three 16-cp incandescent lamps. The left-hand set is in multiple and is used in charging the batteries; the other two sets have been referred to already.

---

*Paper presented before the National Electric Light Association at its 28th convention, held at Denver-Colorado Springs, Col., June 6-11 1905.



Switchboard Connections.

In checking a voltmeter the procedure is as follows: To get 110 volts, switch c is thrown to the right, the meter connected to the posts as indicated, and the rheostat removed to the required point to give 110 on the standard, which is a direct-current meter. Here switch e is down and h up. If we wish 220, d is thrown to the right, e is thrown up and either a or b opened to protect the rheostat against overload, and the rheostats adjusted to the proper point. For 600 volts, switch h is thrown down and a and b are opened. In all direct-current work switch f is thrown to the left. A reversing switch in the line to the meter to be checked will be found useful.

This board lends itself very well to the checking of alternating-current meters, using a hot-wire meter as a standard. This may be connected to the posts marked "to D. C. or A. C. meter" and the alternating-current meter to be checked connected to the posts on the left near the battery posts. The hot-wire meter may be set anywhere by the method given for direct-current meters, and then by throwing f to the right everything but the direct-current standard is cut over to alternating-current, and the transformer switch g can be set to give approximately the same voltage as the batteries in use.

C. R. Brown, Boston, Mass.

To Maintain Approximately Constant Voltage When Throwing One or More Generators In or Out When Operating In Parallel With a Generator Having the Same Source of Exciting Current.

As the exciters here are driven by a small, independent turbine, we have found that in switching on the field-current of a second generator, though with all rheostat resistance in circuit, a very objectionable disturbance is made in exciter speed and voltage, and, in spite of the best possible switchboard attendance, in the voltage on first generator. Besides this, we consider that in the case of having the second generator connected to a separate line and sets of transformers, it is objectionable to have so large a percentage of full voltage, as is thus obtained, switched on suddenly.

To overcome this difficulty, we use a water-rheostat connected to a double-throw switch, as per diagram, so that it may be inserted in a field-circuit of either of two generators or be short-circuited. We thus obtain a very gradual rise in voltage from zero to normal, and a gradual decrease from normal to zero, in starting up, or closing down a second generator, line, and set of transformers, without objectionable disturbance of voltage on first unit, and with a minimum of potential strain on second outfit.

G. Hartman, St. Gabriel, P. Q.

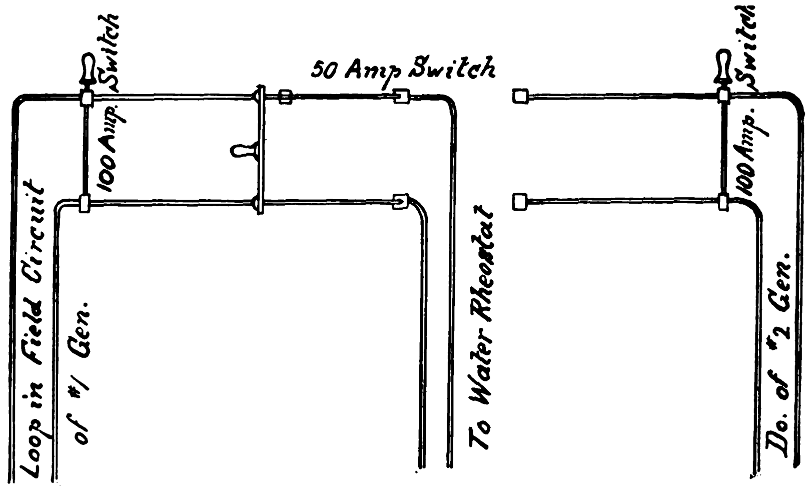

Diagram of Connections.

A Large Bavarian Power Scheme.

An interesting opportunity of utilizing water power in the Bavarian Alps has been reported upon by a Swiss engineer, Mr. Jeanjaquet, in conjunction with a German engineer, Mr. Schmick, of Darmstadt. If the scheme is carried through, it is estimated that sufficient electrical energy will be obtained from the water to drive the greater part of the Bavarian State railways. The idea is to utilize two lakes which are situated in the mountains near each other, but with separate watersheds. They each discharge into the River Isar, but by separate outlets. The lake which will be used as reservoir is named Walchen. The surface of the water in this lake is about 6½ square miles, and the maximum depth of the water in it is over 600 feet. The height of the lake above sea level is 2,635 feet. The lake of Kochel, into which the water can be diverted, is about 660 feet lower, and the direct distance between the two lakes is only some 2,200 yards. A tunnel would have to be made through the hill which divides the two lakes. The scheme, however, goes further than this.

The watershed draining into Lake Walchen is not a very large one, and would not provide the desired power regularly.

A few miles south of this lake there is the River Isar, which in its upper reaches flows from west to east. The level of the river is considerably above that of the lake, and hence it is proposed to divert a certain portion of the water into the lake by means of another tunnel through the dividing hills. This water can then be stored in the lake, which will form a splendid natural reservoir. This, combined with the high fall obtainable, makes the scheme an exceedingly attractive one, and we trust that it will be sanctioned and the works constructed. The lower portion of the River Isar, between the point where it would be diverted into the lake and Munich, is exceedingly rapid, and contains a number of falls which have already been harnessed for industrial purposes. This scheme, however, could be so arranged as not to interfere with these, as the volume of water passing down the river would be rendered more uniform than at present in consequence of the storage reservoir described above. Electrical Engineer, London.

A Dollar Well Invested.

Electricity Newspaper Company.

Gentlemen: As my subscription to your valuable paper, ELECTRICITY, expires on September 20, I send herewith a money order for $1, renewing my subscription for another year.

When I sent in my subscription last year, I was somewhat doubtful as to the value of the investment, but I have since found that that dollar has paid itself back many times over. I have a number of fellow-workmen who would like to get some understandable reading-matter on electricity. I inclose, on separate sheet, a list of them—employes of the Bethlehem Steel Company, Electrical Department, and I think it would be of interest to you to send them assorted samples of ELECTRICITY, and some energetic circular letters. Yours respectfully,

ROGER P. HELLER,

Bethlehem, Pa., Sept. 9. 1905.

An Interesting Booklet.

An attractive catalogue has recently been gotten out by the Wallace Barnes Company of Bristol, Conn. This booklet, which contains some 35 pages of matter, describes and illustrates the many types of springs manufactured by this well known concern. The catalogue contains among other things several wire tables which cannot help but be of value to every one engaged in the electrical or engineering profession.

American Institute of Electrical Engineers.

The next meeting of the Institute will be held at the Assembly Room, New York Edison Company, 44 West 27th street, New York, on Friday, September 22, at 8 P. M. The following papers will be read and discussed: "Air-Gap Flux in Induction Motors," by A. S. Langsdorf; "Standardization of Inclosed Fuses," by H. O. Lacount.

A Two in One Transformer.

A bulletin has just been issued by the Wagner Electric Manufacturing Company, of St. Louis, describing the construction and operation of the so-called "two in one lighting and motor transformer," recently brought out by this well-known concern. This type embodies literally two transformers in one, in that the design is not only superior for lighting service, but adequate and eminently satisfactory for either motor service or combined lighting and motor service. While the advantage of such a transformer is pre-eminently one of interchangeability, and therefore less confusion in installation, as will readily be seen, there is also great advantage in that a minimum reserve of transformer stock is required.

The bulletin in question is fully illustrated, and a copy will be sent free of charge to all parties interested.

Japanese Water Power Enterprises.

A Japanese paper the "Electrician's Friend," published in Tokio, states that there are two water power enterprises on foot. One is known as the Tokio-Denriyoku-Kaisha scheme, and involves the construction of three power stations, having an aggregate capacity of 43,600 hp. These are to be built on Katsura and Sagami rivers, and will be equipped with 24,000 hp. to begin with. The other scheme is known as the Tokio-Dento-Kaisha scheme. One power station of 20,000 hp. is to be built, using a 300 foot head of water on the Katsura river. Electrical energy will be transmitted to Sinjiku, 50 miles away.

799,064. Pneumatic or Hydraulic Transmission of Electric Power. Hans Kowsky, Hastings on-Hudson, N. Y. Filed Sept. 5, 1902.

799,136. Electrically-Controlled Motor. Henry Bezer Westfield, N. J. Filed Sept. 4, 1901.

799,177. Power-Transmission System. Victor Martinetto, Chicago, Ill., assignor of one-half to Harry L. Barth, same place. Filed Feb. 18, 1904. Renewed Feb. 13, 1905.

799,264. Motor Suspension for Electric Motors. Edward D. Priest, Schenectady, N. Y., assignor to the General Electric Company. Filed Feb. 11, 1905.

799,305. Magneto-Electric Generator. Robert C. Crouch and John A. Titzel, Sr., Newcastle, Pa. Filed Nov. 19, 1904.

799,368. Electrical Sparking Ignition System for Gas-Engines and Starting-Switches Therefor. Vincent G. Apple, Dayton, O. Filed Nov. 9, 1903.

799,377. Cut-Out for Electric Heaters. Johannes Harden, Schenectady, N. Y., assignor to the al Electric Company. Filed Dec. 1, 1904.

799,393. Circuit-Breaker for Explosive-Engines. Ralph M. Lovejoy, Meredith, N. H. Filed Jan. 30, 1905.

799,452. Relay. William W. Coleman, Edgewood Park, Pa., assignor to the Union Switch & Signal Company, Swissvale, Pa. Filed April 7, 1905.

Telephones and Telephone Apparatus.

799,137. Transmitter-Arm. Jules A. Birsfield, Rochester, N. Y., assignor to Stromberg-Carlson Telephone Manufacturing Company. Filed Feb. 13, 1905.

799,146. Circuit-Changing Apparatus. Merritt S. Conner, Chicago, Ill., assignor to Stromberg-Carlson Telephone Manufacturing Company. Filed Mar. 17, 1904.

799,160. Switching Appliance for Telephone-Exchanges. Carl M. Hedman, Chicago, Ill., assignor, by mesne assignments, to Stromberg-Carlson Telephone Manufacturing Company. Filed May 22, 1902.

799,205. Telephone-Receiver Casing. Axel R. Thollander, Chicago, Ill. Filed Nov. 10, 1904.

799,346. Calling Device for Automatic Telephone-Exchanges. Frank A. Lundquist and John K. Norstrom, Chicago, Ill., assignors to M. E. Richardson trustee, Sterling, Kan. Filed Aug. 27, 1900.

799,585. Electric Generator for Telephone Systems. Enos B. Willix and John Young, Mount Vernon Iowa. Filed Feb. 25, 1905.

Miscellaneous.

799,049. Lightning-Arrester. Peter C. Hewitt, New York City, assignor, by mesne assignments, to Cooper Hewitt Electric Company. Filed May 16, 1902.

799,191. Electrical Attachment-Plug. Bert E. Salisbury, Syracuse, N. Y., assignor to Pass & Seymour, Solvay, N. Y. Filed July 20, 1904.

799,237. Telegraphy. Sterns F. Jones, New York City, assignor of one-half to Postal Telegraph-Cable Company. Filed Apr. 6, 1905.

799,392. Telegraph-Transmitter. William H. Leonard Mount Vernon, and Joseph H. Lewis, New York City. Filed Dec. 14, 1904.

799,402. Electroplating Apparatus. Louis Potthoff, Brooklyn, N. Y. Filed Apr. 30, 1904.

799,422. Watchman's Recording and Alarm System. Albert E. Waggoner, Grand Rapids, Mich. Filed July 13, 1903.

799,433. Support-Fastener for Lightning-Conductor Carl Bajohr, St Louis, Mo. Filed Mar. 29, 1905.

THE TELEPHONE WORLD.

Planning Telephone Union.

As a sequel to the important meeting of the National & Interstate Association of Telephone Companies in St. Louis, Mo., last year, it is reported that a giant telephone merger of all the Independent telephone lines has been formed with the startling capitalization of $200,000,000, in which merger a syndicate of St. Louis magnates plays quite a distinguishing part. The details were arranged at a meeting held in Pittsburg last week at which James G. Splane, president of the Pittsburg & Allegheny Telephone Company, said: "We will meet in St. Louis next week to go over the result of the inspections and prepare for the ultimate union of the telephone companies, only in so far as the long-distance business is concerned. How soon the consolidation will take place I am unable to say, as there are thousands of details that must be gone over before it occurs." It is the plan of the Independent Association to build connecting links between the systems included in the deal. It is expected that eventually the Keystone Telephone Company, which is an active competitor of the Bell Company in Philadelphia, will join the movement. This will mean a new trunk line between Pittsburg and Philadelphia, going through Johnstown, Harrisburg, Lancaster and other points on the main line of the Pennsylvania Railroad.

The St. Louis men interested are Adolphus Busch, the millionaire brewer; Breckenridge Jones, vice-president of the Mississippi Valley Trust Company; John D. Davis, general counsel and vice-president of the Mississippi Valley Trust Company; August Gehner, president of the Gehner Realty & Investment Company; William F. Nolker, brewer and capitalist; C. M. Forster, first vice-president of the St. Louis Brewing Association; Herman C. Stifel and a number of others.

The Wisconsin Telephone Company has placed a local exchange on the floor of the chamber of commerce in Milwaukee, Wis., through which all the lines of the grain operators on the floor are connected direct with the general system, as well as with each other.

The China Lake Telephone Company, of which J. W. Thompson is manager, is stringing poles and cross arms in the lake road from South China to China, Me., a distance of seven miles. This addition to the line will accommodate a large number.

A movement is on foot in Brushton, N. Y., for the building of a local telephone line, the cost of construction and maintenance to be paid pro rata by each subscriber. C. A. Wardner, electrician, has agreed to build the line and install the instruments, at a cost not exceeding $15 for each instrument, providing a sufficient number subscribe.

A meeting has been held recently in Fowler Col., to consider a mutual telephone system project. After considerable discussion as to conditions it was decided that the plan was feasible. Committees were appointed to gather data for a report to be made at a meeting to be held soon.

Telephone Deal.

Postmaster Frank A. Knapp, of Bellevue, O., has purchased a controlling interest in the local telephone company and the Bellevue Home Telephone Company. The Local Telephone Company has 4,200 telephones installed, and 200 miles of toll lines in Huron and Crawford Counties, with exchanges in 16 towns. With Mr. Knapp are associated some of the leading Independent telephone men in the State. By the deal Mr. Knapp and his associates acquire control of telephone property representing an investment of $400,000.

York Company Doubles Stock.

The stockholders of the York, Pa., Telephone Company at a recent meeting voted unanimously to increase the capital stock of the corporation from $200,000 to $500,000 for the purpose of placing the wires of the company's system underground, making important rural extensions to the system, and adding general improvements. Charles H. Lidlie, electrical engineer, of St. Louis, Mo., has been engaged to prepare plans for a conduit system for the county.

A. B. Hunt, speaking of the prospects for securing a franchise from the Omaha, Neb., city council for an Independent telephone company, says that he and the two other promoters of the company, Messrs. T. E. Parmelee and T. H. Pollock, certainly expect the franchise will be granted in due time. "We are not seeking to rush things particularly," said Mr. Hunt. "We have made such a proposition that we are entirely confident the councilmen will look on it with favor. The Independent systems are proving the lever to alter rates that have been fixed for many years and to secure much better service for business men and farmers. The laboring element gets in on the money spent for buildings, equipment, repairs and betterment. Every new Independent company means many thousands of dollars of money expended for labor and material every year."

At the recent meeting of the Gadsden, Ala., city council a franchise was granted to W. H. Crumb and associates to erect a telephone system in that city, work to commence within six months and the entire system to be completed within 18 months. The new company is given a franchise over all the streets, alleys and highways of the city, It states that the rate for business houses will be $3.50 per month, and for residences $1.75 per month.

Competition lately induced the Chicago, Ill., Telephone Company to offer to furnish the city telephone equipment at one-third the price it formerly had charged. The city has not accepted the Chicago Telephone Company's offer, but has taken it under consideration.

The Santa Fe, N. M., Telephone Company has been granted a franchise for the term of 25 years.

Lewis Blades has applied for a telephone franchise in Hope, Ind.

The Stamper Union Telephone Company has obtained a franchise in Benton, Ill.

Medal for Telephone Company.

The International Exposition of Social Economy, which is being held at Liege, Belgium, notified S. M. Greer, private secretary to U. N. Bethel, general manager of the New York Telephone Company, that the company would receive a silver medal in recognition of its welfare work among its employes.

The award was the first made to an American company. The exhibit of the New York Telephone Company included illustrations of its work relative to the care of the telephone girls.

Telephones to Check Forest Fires.

For the better protection of the forest reserves against fire, the forest service, in co-operation with the Weather Bureau will install a system of telephone lines and stations on them as rapidly as possible. The first system will be installed on the Big Horn forest reserve in Wyoming.

News from Oswego, N. Y., states that the Ontario Telephone Company has filed with the county clerk a mortgage for $200,000. The mortgage is given to the United States Guaranty & Trust Company of New York, and was filed by Elisha B. Powell, attorney for the company. The mortgage is given to provide for the proposed improvement of the lines of property. The mortgage tax on the issue will be $1,000.

The Retail Merchants' Association of Norfolk, Va., will ask the city council at its next meeting to take some steps to secure a better service from the Southern Bell Telephone Company or suggest any remedy that lies in its power to produce such a result.

The Cape May, N. J., city council at its monthly meeting passed to its third and final reading an ordinance requiring the Delaware & Atlantic Telephone Company to place its wires underground, at least 2,000 feet to be so placed within a year.

Cleveland and Cincinnati, O., will soon be connected by telephone. The Big Four will extend its system, which was installed between Cleveland and Galion and between Galion and Bellefontaine, eight months ago. The plan now is to install telephone service over the telegraph wires from Galion to Cincinnati, also from Springfield to Sandusky.

The Hudson River Telephone Company has applied to the board of trustees of Malone, N. Y., for the right to put conduits underground for conveying its wires through the principal streets.

The New Long Distance Telephone Company has been granted a 25-year franchise in Frankfort, Ind.

The work on the Independent telephone system in Mexico City, Mex., is being pushed rapidly.

The Canfield Independent Telephone Company is extending its lines to Ellsworth, O.

Independent telephone systems are making rapid progress in Seward County, Neb.

GENERAL ELECTRICAL NEWS.

LIGHTING.

Addison, Mich.—This village has decided to have an electric lighting plant and the contract for a first-class plant was awarded to G. F. Avis, of Hudson.

Alexandria, Va.—This city has an electric light plant. It is now promised to sell the electric plant and to give the purchaser, who will be expected to enlarge the plant, the monopoly of selling electric light and power in the city. It is understood that there will be two bidders.

Ashland, Va.—The Virginia Light & Power Company has been incorporated to operate an electric light and power plant, with a capital stock of $100,000. H. W. Anderson is president.

Clinton, Tenn.—The Clinton Waterworks, Electric Light & Power Company will erect a power house 40 x 60 feet. William B. Crawford, of Oliver Springs, Tenn., is engineer and general manager.

Daytona, Fla.—Three new dynamos will soon be added to the electric light plant here, at a cost of $20,000.

Dexter, Me.—The Dexter Electric Light Company has sold its plant and business to N. Curtis Fletcher, of Boston.

Eagle Pass, Tex.—The Texas-Mexican Electric Light & Power Company has increased its capital stock from $20,000 to $40,000.

Fort Worth, Tex.—George W. Armstrong has secured a franchise to operate electric light, gas, steam, heat, hot water and oil plants.

Gilliam, Mo.—The Gilliam Electric Light & Power Company has been incorporated with a capital stock of $5,000, to operate an electric light and power plant. The incorporators are David C. Burton, J. E. Kirk, A. W. Deis and others.

Glenwood, Wis.—The proposition to bond this city for an electric light and waterworks plant was lately carried.

Gonzales, Tex.—The Citizens' Electric Light & Power Company lately increased its capital stock from $5,000 to $10,000.

Hermon, N. Y.—The Hermon Electric Light Company, capitalized at $15,000, has been incorporated by James H. Cullimore and William G. Popple, both of Hermon, and George N. Popple, Oswegatchie.

Marshalltown, Ia.—The city council is considering improvements in the city's lighting system. New machinery will probably be installed.

O'Neill, Neb.—W. A. Loudon, an electrical and mechanical engineer of Chicago, and connected with one of the largest firms in that city, is here trying to interest the council and citizens in the installation of an electric lighting plant.

Owensville, Mo.—This city is to have an electric light plant. Peter Helling is interested in the enterprise.

Pawhuska, Okla—The Pawhuska Electric Light, Ice & Water Company has been incorporated with a capital of $25,000, by J. W. McLoud, of Little Rock, Ark.; Beeks Erick, of Fort Wayne Ind.

Pierre, S. D.—The city council has decided to put in an an incandescent electric lighting plant, to be operated by waste water from the city wells, tests showing that they can develop more than enough power from this source for the operation of such a plant. There has been a demand for such a lighting system for a long time and the city now intends to meet that demand.

Rockmart, Ga.—Enterprising citizens here have decided to have electric lights for this city. A subscription for stock was lately started with a view to raising $5,000 for electric lights, and the stock has all been taken. R. R. Beasley is the moving spirit in the matter.

Roseville, O.—The Clay City Electrical Company, incorporated with a capital of $10,000, will operate a light and power plant.

Salem, O.—A deal of considerable importance was recently announced in the sale of the entire plant and holdings of the Salem Electric Light and Power Company to E. E. Beam, of Cleveland, and S. D. Gilbert, of Cincinnati.

Topeka, Kan.—The new Edison Company is preparing to spend about $200,000 in extensions and improvements on the Topeka electric light plant. L. E. Myers is at the head of the company.

STREET RAILWAYS.

Bloomington, Ind.—The county commissioners have granted a franchise to the Wabash & Southeastern Traction Company.

Bluffton, Ind.—The Wells County Commissioners lately granted a franchise to James West, the chief promoter of the Portland Montpelier & Huntington electric line, to make a short connection between these three cities.

Dayton, O.—A new traction line, which will connect this city and Connersville, Ind., will enter from the southwest. It will be built by the Dayton Southwestern Traction Company.

Dubuque, Ia.—After discussing plans and making several preliminary surveys an interurban electric railway connecting this city and Platteville and other Wisconsin towns will be a reality in the course of a year.

East Liverpool, O.—The plans have been made to build an electric line from Youngstown to this city, a distance of 50 miles. The construction, it is believed, will cost at least $1,500,000.

Frackville, Pa.—The borough council lately granted the Tamaqua & Pottsville Electric Railway Company a franchise through this borough.

Lowell, Mass.—Extensive plans for a new trolley line from this city to Boston, independent of the Boston & Northern, and with prominent Boston and Maine officials in it, are rapidly approaching completion.

Marshall, Ill.—The city council has passed an ordinance granting a franchise to T. N. Lakin and C. B. Sonemanan for an electric line from East St. Louis to Terre Haute.

Orleans, Ind.—It is announced that work will shortly begin on the new electric line between the Springs and Louisville.

Palestine, Tex.—The chances are very good for the construction of an electric line from this city to Corsicana.

Puyallup, Wash.—The trustees of the Puyallup Valley Traction Company recently held a meeting here and discussed plans for the immediate construction of the trolley line from this city to Tacoma.

Sisseton, S. D.——There is a project on foot to build an electric line from this city to Browne's Valley, Minn., thence to Hankinson, N. D. The promoters of the scheme reside in this city. H. S. Morris is cashier, and J. A. Rickert president.

Syracuse, N. Y.—The Syracuse, Lake Shore & Northern Railroad Company has been formed here to operate a street surface electric road 15 miles long from this city to Baldwinsville. Its capital is $2,250,000, and directors are H. S. Holden, C. M. Warner, A. K. Hiscock, William Nottingham and L. C. Smith, all of Syracuse.

Wellsburg, W. Va.—It is belived that a traction line will, in the near future, be built to Bethany.

Winchester, Ill.—Ground was lately broken for the new electric interurban railway which is to be built between this city and Petersburg.

BIDS WANTED.

Albany, N. Y.—Bids will be received until September 27, by the State Commission in Lunacy in this city, for an engine, generators, switchboard and motors, feed cable and wiring, steam piping and connections, at the Utica State Hospital.

Washington, D. C.—The Interior Department is inviting sealed proposals until November 1, at which time they will be opened at the office of the electrical engineer, United States Reclamation Service, 398 Pacific Electrical Building, Los Angeles Cal., for furnishing complete, f. o. b., bidders' works, one or more alternating current, 900 kw., 25 cycle generators; one or more 100 kw. direct current generators, for exciter, and one switchboard containing one panel for generator and one panel for exciter, for use in the Roosevelt power house, Salt River Project, Arizona. Bidders can obtain full particulars on application to the chief engineer of the Reclamation Service of this city, or to O H. Ensign, electrical engineer, Pacific Electrical Building, Los Angeles. —The Bureau of Supplies and Accounts of the Navy Department is inviting sealed proposals until October 10 for furnishing at the New York Navy Yard and at the works of the Fore River Shipbuilding Company, Quincy, Mass., the New York Shipbuilding Company, Camden, N. J., and the Newport News Shipbuilding & Dry Dock Company, Newport News, Va., a quantity of elevating, rammer and ammunition hoist electrical equipments. Applicants for blank proposals should ask for schedule 143, which can be obtained on application to the Bureau or to the Navy Pay Office in New York. Specifications can be obtained by applying to the Bureau of Ordnance, Navy Department, Washington, D. C. The Bureau is also inviting sealed proposals until October 3 for furnishing Eastern Navy Yards with the following supplies: Schedule 134, battery cells, steel conduit, wire and miscellaneous electrical supplies. On October 10 the Bureau will open bids for furnishing Southern Navy Yards with the following: Schedule 137, incandescent lamps, conduit fittings, bell wire, insulating tape. Blank proposals will be furnished on application to the Bureau, and those for Eastern yards can also be obtained at the Navy Pay Office in New York.

NOTES FOR INVESTORS.

Latest quotations for copper are: Electrolytic, 16@16¼c.; Lake 16@16¼c.; casting, 15¾@16c.

The General Electric Company has declared a regular quarterly dividend of 2 per cent. payable October 16.

Mr. J. J. Mitchell, the well-known financier, says that in his opinion a settlement of the Chicago traction problem will be reached in the next 60 days.

The Western Union Telegraph Company has declared a regular quarterly dividend of 1¼ per cent., payable October 16.

The directors of the Boston & Suburban Electric Company have declared a regular quarterly dividend of fifty cents per share, payable October 15.

The Interborough Rapid Transit Company of New York has declared a dividend of 2 per cent., payable at the office of August Belmont & Co., on October 2.

Stone & Webster of Boston report that semi-annual dividends of $3 per share will be paid on the preferred stock of the Savannah (Ga.) Electric Company and of the Seattle, (Wash.) Electric Company on October 2.

The annual meeting of the stockholders of the Thirty-Fourth Street Crosstown Railway Company, Forty-Second Street & Grand Street Ferry Railroad Company, Central Crosstown Railroad Company and Fulton Street Railroad Company, all of New York, will be held on October 3.

Rumors have it that the traction "deal" in this city will be taken up at once and pushed to completion. The character of the alleged deal does not seem to be very generally known, the principal view of it being that it is a deal between the Metropolitan and the Interborough. This, according to information which comes from a reliable source, is an error.

Stone & Webster of Boston have added to their properties the Northern Texas Traction Company of Fort Worth, Tex. This company comprises the street railway lines in Fort Worth, and the high speed interurban line between Fort Worth and Dallas, a distance of 35 miles.

According to latest reports the Chicago Electric Traction Company has been sold to W. S. Read, of Chicago. Details of the transaction are not obtainable. Mr. Read, who organized the syndicate which purchased the holdings of the Chicago & Southern Traction Company, is a well known financier and promoter.

A dispatch from Lexington, Ky., says that J. Levering Jones and Chandler Brothers of Philadelphia have bought the Lexington Street Railway & Light Company for $2,000,000, the Blue Grass Traction Company, for about $2,600,000 and the Frankfort Railway & Light Company for about $300,000. They have bought additional public utilities, making a total purchase of about $8,000,000. The property will be greatly extended.

The Manhattan & Long Island Railroad Company of New York City was incorporated on Thursday last with a capital of $10,000,000, to operate an electric railroad, eighty miles long in Greater New York and Long Island. The road is to run from Long Island City to Northport. The directors are Edward Mackey, D. T. Meyer, H. H. Bowtell, Samuel Y. Sauber, Franklin M. Walter and George F. Macardle of New York City; Robert M. Stockwell of Yonkers, A. Parontaud of Brooklyn and Henry Guinard of Watchung, N. J.

EDITORIAL NOTES.

The Girdle Around the Earth.

Before President McKinley's death his expressed and reiterated desire was to see the Orient and the United States united by a trans-Pacific cable. But the hurried course of events, resulting finally in his tragic death, left the matter in abeyance. In fact, the developing crisis between the empires of Japan and Russia, acted as a retarding influence to any form of external enterprise and the question of the unification of the East and the West was delayed until a more propitious occasion.

The president of the Commercial Cable Company, however, recently sent word to the press of America that the necessary diplomatic steps had been taken with such success that the construction of this connecting link was an assured fact. Through the influence of Mr. Takahira, the Japanese Minister to the United States, the signature of Japan was secured to an agreement with the cable company giving it landing right in Yokohama. This, in conjunction with similar landing rights in Shanghai secured from the Chinese Government, means the accomplishment of one of the most gigantic enterprises hitherto attempted. As Mr. Clarence Mackay states, "We will pierce the Far East at three points, the Philippines, China and Japan. With the cable just completed to Newfoundland, plus a fifth cable to Europe to be laid this month, and the cable from Guam to Japan and from Manila to Shanghai, the company will have a system extending nearly around the globe." So far, in spite of a common belief to the contrary, the Pacific Ocean has not been bridged, and the transmission of dispatches was by a round-about way from Oriental centers. Telegraphy has covered the earth with its network, and this, in conjunction with the cables already in use, constituted the connecting links between London, New York, Paris, Berlin, and the far distant lands of Africa and the Orient.

A great sense of obligation should rise in the heart of the thinking man in coming to a full realization of the value and importance of these epoch-making moves. Geographical boundaries may change through rapine and warfare, and even political cataclysms change the internal governing forces to an unrecognizable extent, yet the commercial expansion, industrial and financial development of any great center of civilization, is under the absolute sway of the cable reports.

In this respect the cable is the regulator of the world's affairs. It is the means by which news, quotations and messages are flashed from metropolis to metropolis. The establishment of a complete girdle of cables around the globe would give a greater impetus to progress than can be adequately described. Electrical difficulties of a far-reaching and depressing nature have been gradually overcome. When Cyrus Field, with the assistance of Lord Kelvin, laid the first cable, it failed miserably. It lay at the bottom of the Atlantic for many long months before a companion cable took its place. Trials of this kind cost millions of dollars and required the aid of the keenest engineering minds of the day to overcome the stupendous problems involved.

Cable laying is now a matter of as much scientific assurance as cable manufacturing. The siphon recorder has displaced the mirror galvanometer with its uncontrollable and eccentric deflections.

To-day the girdling of the earth is merely a matter of investment. The time is not so far off when the laying of a cable, if successful, was regarded as the one human deed that defied competition.

Fatal Accidents.

Fatal accidents will occur in power stations in spite of everything that is said and done. Fortunately such fatalities are not of frequent occurrence in this country in spite of the large number of power houses scattered throughout the length and breadth of the land.

In England the subject of death by electric shock is receiving just now considerable attention, due to two fatal cases which recently occurred.

One of the victims was a trained electrical engineer who knew the dangers of the station and who was pointing them out to a laborer who was to make some alterations. His hand came in contact with a live part of the switchgear while his attention was taken up with conversation relating to the work.

The other victim was a workman who, it seems, was admitted to a high tension sub-station to perform certain duties without realizing the serious nature of his surroundings, a fact which after the accident brought upon the company owning the station the censure of the coroner and his jury.

Adequate precautions are necessary to protect those who are not acquainted with the dangers attending high tension working, but we know that technical men who do know the dangers too frequently disregard their existence and omit to use the special precautions provided. There is a text here for a long lecture.

The Electrical Export Trade.

Probably no other branch of industry is paying more attention to export trade than is the electrical industry. It has made wonderful strides in the last few years in the foreign trade, but there is still plenty of room for expansion. This leads us to remark that a factor in foreign trade upon which too much stress cannot easily be placed is the salesman. However excellent the product may be, and however reasonable the price, it is, after all, the seller who puts it upon the market. The traveling man is the real pioneer of trade. Well located general agencies, good advertising, willingness on the part of the manufacturer to expend money in extending his market, and an efficient consular service, are all important, but all may fail if the experienced, energetic salesman is wanting. This may be accepted as an axiom of trade which is universal in application, and of which the history of our own trade, domestic and foreign, furnishes abundant proof. For instance, in Germany, evidence is not wanting that an agency at Hamburg or Berlin, however well equipped, cannot hope to secure an important trade in other parts of the empire except through capable salesmen who thoroughly canvass the territory.

It is no reflection on foreign salesmen to say that, as a rule, American salesmen, or salesmen thoroughly familiar with American methods, probably succeed best with American goods. This is certainly true of machinery, the American salesman of which is likely to have had an apprenticeship in the factory or to have special knowledge of machinery. The foreign machine agent is likely to have preconceived notions of how sales should be made for a great millionare business concern, and how far it is proper for a merchant to get around a dynamo with a monkey wrench or an oil can. In fertility of resource to avoid delays in forwarding goods, in fulfilling contracts, setting up machinery, etc., the American salesman has no superior.

The electrical manufacturer who is really in earnest in his efforts to secure foreign business should so organize his selling department abroad as to avoid delays as much as possible. Failure on his part or that of his general agent to answer correspondence or to forward goods promptly may cripple the efforts of the best salesmen. The plan adopted by some large manufacturers of meeting their salesmen in foreign fields seems to yield good results. If this cannot be done by the manufacturer himself, he can have his general agent do so and report to him.

The rapid extension of our avenues of trade into foreign lands should stimulate a large body of our young men in the learning of additional modern languages and in other preparation for a career in this branch of our trade. In no other field of endeavor is higher business talent required and in none other are the rewards more certain.

UNDER THE SEARCHLIGHT.

Notes and Comments on Various Topics.

It seems now as if the long-looked for opposition to the Bell Telephone monopoly in New York is a reality. It will be seen in our news columns that a giant Independent Company, with $50,000,000 capital, filed articles on Saturday at Albany, and we are informed that the influential backers of the new company are ready for a great battle with the Bell.

The Illinois State Electric Association will hold its annual meeting at Peoria, October 5 and 6, with headquarters at the National Hotel.

The general commission on municipal ownership and co-operation of public utilities appointed by the National Civic Federation will be made at a meeting called for October 5 at Columbia University, New York City. It is proposed then to appoint a sub-committee of nine to be sent to Europe for four months to investigate the results of municipal ownership abroad. A similar committee will make inquiries in this country.

Prof. Herbert S. Evans of the University of Nebraska has been appointed professor of electrical engineering in the University of Colorado at Boulder.

A scheme is on hand to make Pittsburg, Pa., smokeless. The object is to create a central power plant in Washington County, about 30 miles from that city, and to supply power for the many towns in Western Pennsylvania and Eastern Ohio. The power is to be transmitted through pipes and by electric cables to the cities. A meeting is to be held in a few weeks and a company organized with sufficient capital to start the contracts. It is claimed that it will only require one year to erect the buildings and start the plant.

Consul Ernest L. Harris of Chemnitz reports that it is contemplated by the German Government to use wireless telegraphy to prevent accidents. He writes: "Recent disastrous railway accidents in Germany will probably lead to the general introduction and use of wireless telegraphy on all the State railways. Two years ago exhaustive practical experiments were commenced and continued until recently on the military railway leading from Berlin to Zossen. The telegraph stations on the route were each fitted up with a transmitter and receiver, while the trains were equipped with the same apparatus. The ordinary telegraph wires along the track were also used to facilitate the work. The experiments proved conclusively that the different stations could at any time communicate with a train running at full speed and warn it of impending danger."

LIGHT, HEAT AND POWER PRINCIPLES.—I.

BY NEWTON HARRISON, E. E.

Introduction.—The field of engineering has broadened sufficiently to include more than the term itself implies. Engineering, as now construed, is not limited entirely to the consideration of those problems hitherto regarded as belonging entirely to its peculiar domain. On the contrary, it embraces the most important problems of the hour, as far as material comforts are concerned. It enters into the field of illumination, with the purpose of pointing out, as well as crystallizing, the principles upon which that which is called illumination and wiring are based. It enters into the field of heating and cooking; regarding these domestic propositions as part of the scheme as now outlined. Hygienically, it offers to be the means by which not only sight is preserved by the development of a bright and uniform light in all homes and public places, but it offers to supply, by the use of electricity, means by which the temperature of buildings, whatever their purpose may be, is sustained without the use of steam or heated air. As a source of light, electricity is a non-oxygen consuming form of illumination, and as such is justifiably the superior of any other source of light suggested or utilized. As a source of heat it withdraws nothing from the surrounding atmosphere, leaving it as before with its full quota of oxygen gas. In these two respects, the applications of electricity have such pronounced advantages that the only situation, left to consider, is that relating to the cost of production in either case. In that of light, the public estimation of its value for street and private lighting leaves little to be said. As regards its use for heating, the question of cost appears as the only element requiring a better solution. Although generally regarded as the only and ultimate means of light and heat in the future—electricity is not entirely within the scope of the general public as an ordinary commodity. When its introduction begins in the average home, then lighting will fill its expected niche in the category of household wants. Both light and heat as produced by electricity represent distinct departments of electrical engineering requiring separate treatment and consideration. They, in common with power produced by the same means, are broad enough in their scope, to cover a field of such great dimensions, that with the exception of the principles and methods employed in the transmission of intelligence; or isolated instances of the application of electricity in medical treatment or research; electrical engineering as thus defined enters into the operation of city and suburban life more than any other force to which reference could be made.

Conditions of Electric Lighting.—Without a demand for an electric light equipment no community can feel justified in encouraging the erection of such a plant. The conditions of electric lighting are those which primarily arise through the necessity for a better form of illumination, more than through the fact, that either a power or fuel source is conveniently near, or an enterprise of some sort is required to give that touch to town or city life best secured through the use of electricity for lighting. Yet whether these circumstances appear or not, the conditions of electric lighting are those which enter into a consideration of the following:

1. Whether the community to be supplied with a plant is compact and represented by stores and private dwellings as well as needing light in its principal thoroughfares.

2. Whether the community to be supplied with a plant is of a scattered nature though represented by stores and private dwellings as well as needing light in its principal thoroughfares.

5. Whether the character of the community is sufficiently permanent to lead to the conclusion that further extensions of the system will be imperative to meet the demand for light.

4. Whether the growth of the community is sufficiently independent of large factories, to possess the inherent power of expansion, without regard to the success of said factories or not.

5. Whether the community is large enough in size to require more than one center of distribution in the lighting scheme, such as sub-stations, etc.

6. Whether a single station will be sufficient to supply all requirements when the expected contracts for light are closed with the municipality, and the private consumers desiring electricity.

7. Whether water power or coal will be utilized for the purpose of operating the plant, or both; in which case the temperature variations during the year will have to be taken into account to determine during what part of the year the water will be serviceable as a source of power.

8. Whether a contract can be closed with the village, town or city, for public lighting, to partly guarantee the success of the project.

9. Whether the transportation of machinery is within the scope of the facilities afforded, or whether heavy additional expense for machinery would have to be added through inadequate railroad connections.

10. Whether skilled help can be secured with ease or with that difficulty which would add unduly to the running expenses of the plant.

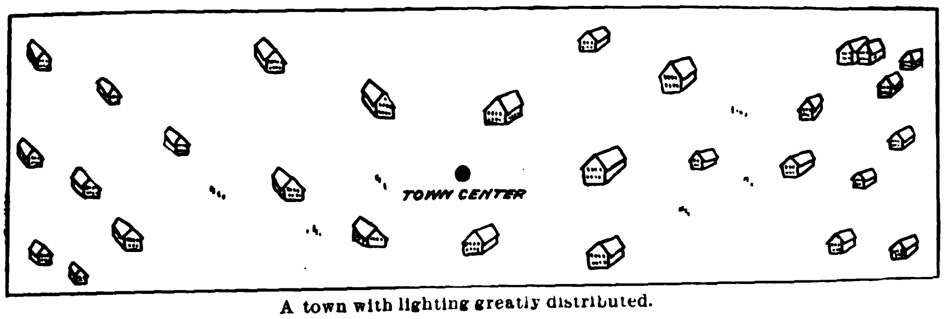
Along these lines, the conditions of electric lighting may receive the attention necessary to secure an intelligent appreciation of all requirements. Other items, in addition to these enumerated, may be added, as fresh circumstances arise, when the final consideration of essential details will bring them to view. But although it is customary to regard this particular department of applied electricity as a purely technical proposition, it is clearly evident that as a technical business proposition it emphatically holds first place. Instances of where gas lighting plants were installed, long before the electric light plant, have given rise to the question whether such competition, when keen, can lead to any form of success in a contracted community.

In other words, the best conditions for the healthy developmont of the electric light industry, are those which first mean a popular demand for illumination of this character; second, the possibility of expansion on the part of the town; and third, a price for water power or fuel, which permits a reasonable profit in its transformation from mechanical to electrical energy.

Character of the Current Employed.—The expense of installing an electric light plant, is only a part of the total expense invited by the enterprise. The erection of pole lines or the interment of the conductors underground is well recognized as a feature of the construction which is as necessary, as it is subsequently costly, to keep in repair. In this respect the setting of the poles, the choice of the insulators, and the size of the copper conductors, are bound to have a future effect upon the operation of the plant.

On the other hand, the town may be several miles in length with its business center, important streets or avenues, and suburban homes stretching along over a considerable distance. A long pole line would thus become a necessity for the distribution of the current to the various points of tap. If the town is grouped around a given center the population, comparatively thick in numbers, and then thinning rapidly, the problem of choosing current becomes much simplified. The currents to be generated belong to either of two kinds as follows:

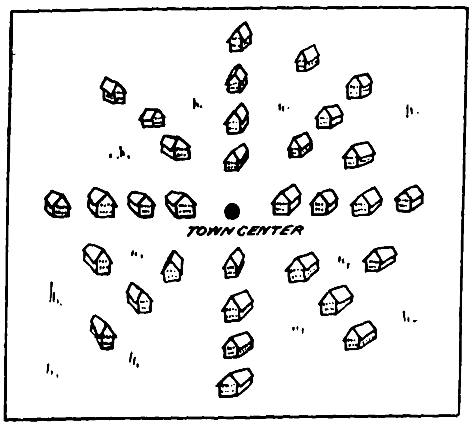
First—Alternating current of high pressure, used in conjunction with transformers, for converting it to a lower pressure whenever necessary.



A town with lighting greatly distributed.

Second—Direct or continuous current of comparatively low pressure, for use just as generated in stores, streets or homes along the line or within easy access of it.

The use of alternating and direct current in small communities is governed by the geographical position of it as already stated. The cost of an alternating and direct current plant, for equal amounts of lighting displays this feature: That under propitious circumstances, it is better to use direct than single phase alternating current, for the reason that motors cannot be readily run by the latter except when specially constructed. Whereas the direct is in some respects, an advantage, it is also a more expensive form of energy to conduct; because if transmitted at a high pressure, it is not readily transformed down; and for equal powers in comparison with the alternating current, takes very much more copper.



A town with lighting concentrated.

But the proposition which practice has laid down is this, that when the towns are distributed over a large area, the alternating is by far the best current to employ. On the other hand, if a particular case presents itself, of a village or town closely grouped— then the cost of a direct current plant, with its convenience would become readily apparent, if the use of power for small motors is considered. The conclusions reached are therefore as follows:

First—A straggling town covering considerable area and distance is a case where alternating current is the only form of electricity to employ.

Second—A small, compactly settled town is a case where the use of direct current is worthy of first consideration.

Comparison of the Circuits for Equal Power.—The only means of comparing the sizes of copper wire required, in the case of a given amount of electrical energy transmitted, as high pressure alternating, or low pressure direct, is by estimating the relative cross-sections of copper required for equal lengths of circuit. Taking a given case of 100 kilowatts of power, transmitted as alternating current a distance of one-half mile, at a pressure of 2,000 volts, the total watts would equal 100 × 1,000 = 100,000. At 2,000 volts pressure the amperes would be equal to 100,000 ÷ 2,000 = 50, without paying any attention to the losses experienced through inductive efforts, etc. At present the size of wire required with a single phase system would be, with an allowance of 10 per cent. drop in the line, not much less than

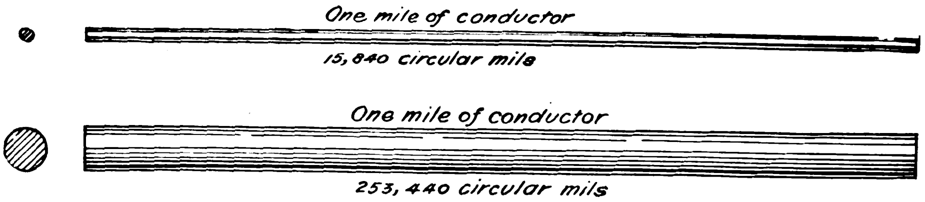
$$\text{C. M.} = \frac{\text{Length of line in ft.} \times \text{amperes} \times 12}{\text{volts drop}}$$

$$= \frac{5{,}280 \times 50 \times 12}{200} = 15{,}840 \text{ cir. mils,}$$

or about a No. 8 wire B. & S. gauge. On the other hand, if the same method and the same line conditions are supplied in the case of the direct current sytem, the figures present themselves as follows with a 10 per cent. drop and a pressure of 500 volts. C. M. = circular mils. Amperes = 100,000 watts ÷ 500 = 200.

$$\text{C. M.} = \frac{5{,}280 \times 200 \times 12}{50} = 253{,}440,$$

or a wire which could only be strung as a stranded cable, as its size would be more than No. 0000 B. & S. gauge, or about 24 No. 10 wires in circular mils. Comparing this cross-section of copper with that of the first, means 253,440 ÷ 15,840 = 16 times. This result shows, that for a half mile run it is not practical to use 16 times as much copper is one case than another. As two conductors are employed in each circuit, the total weight of copper would be really that of one mile of each of the given sizes.



Comparison of the two sizes of conductors carrying equal power.

Pressures of Standard Generators.—The outside demand has largely contributed to the adoption of certain standard pressures. These run as follows with direct and alternating currrent generators:

Direct Current. Generators of	Alternating Current. Generators of
125 volts.	2,200 volts.
250 volts.	6,000 volts.
550 volts.	10,000 volts.
600 volts.	15,000 volts.
1,000 volts.	20,000 volts.
2,000 volts.	30,000 volts.
2,500 volts.	40,000 volts.
3,000 volts.	60,000 volts.

In the table the last four quotations of 1,000, 2,000, 2,500 and 3,000, the direct current machine for high tension arc lighting is kept in view. The last figures, showing the difference in sizes of conductors, for 500 direct and 2,000 volts alternating would necessarily become the same if a high tension direct current were introduced. But although this system would serve and be less expensive than the alternating for street lighting, it could not be employed for hall or residential lighting on account of the great danger involved.

Capacity of machines.—The use of either alternating or direct current generators calls for a knowledge of what is to be expected of them, when under heavier strain than usual. The overload factor, in other words, is a point of first importance in their purchase. According to the recommendations of the American Institute of Electrical Engineers, in its Standardization Report, the ability of a generator to be overloaded 25 per cent., without its windings rising in temperature more than 27 degs. Fahr. over the normal temperature of full load, or 50 per cent. for a short period of time without destructive sparking, is a sign of the value of the generator to meet the conditions of service. The questions relating to the best conditions under which electric lighting can be begun are not more important than those which relate to the qualifications of a machine to perform its functions in this field of engineering.

ELECTRICAL POINTERS.

BY W. H. WAKEMAN.

The night engineer of a certain mill was preparing to start the small independent engine which runs the dynamo for incandescent lighting. Having used a kerosene oil lantern on some other work and wishing to hang it where it would afford sufficient light for oiling and starting the small engine, he hung it on one of the electric switches close by.

Proceeding to start the dynamo he raised the voltage to its normal place and threw in the main switch. As the metal handle of the lantern was on the positive and negative parts of an auxiliary switch it made a short circuit without delay. (See Fig. 1.) Lively fireworks were in evidence for a few seconds but no special harm was done. The engineer has another place to hang his lantern now, where the handle does not imbed itself into the hook which supports it.

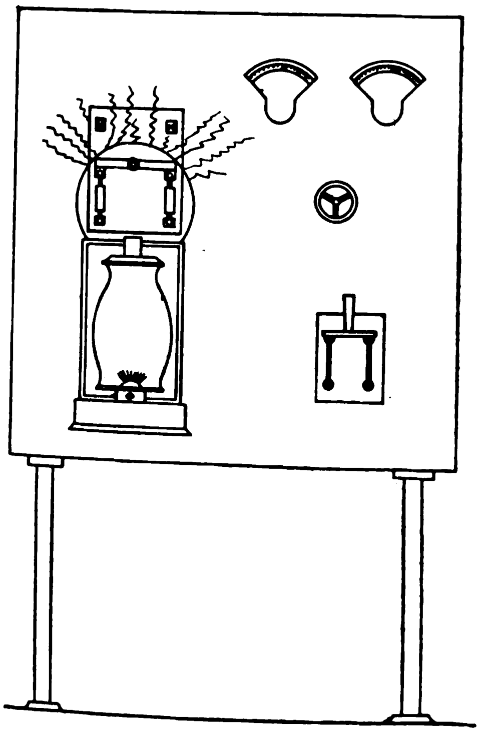


FIG. 1.

On another occasion when an attempt was made to start the aforementioned dynamo it failed to generate current. The fault was finally located at 2, Fig. 2, where a loosely made connection failed to answer the purpose. It is not readily discovered because the wire was practically out of sight more than appears in the illustration, for the frame was made in what might be called a hollow or concave form, and this wire was close to the highest part of the under side of it. The tape with which it was thickly covered helped to conceal the fault.

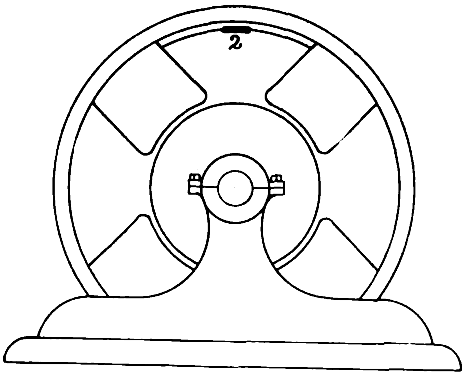

FIG. 2.

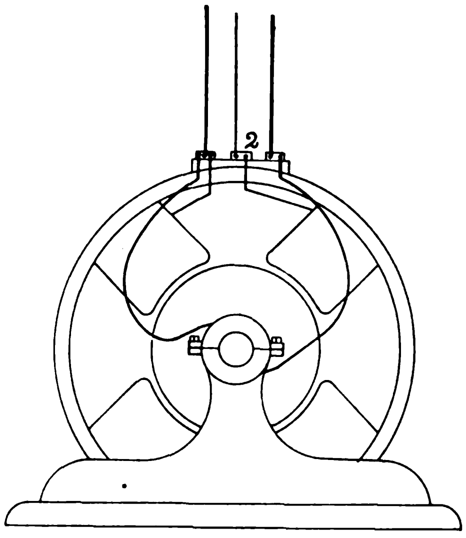

FIG. 3.

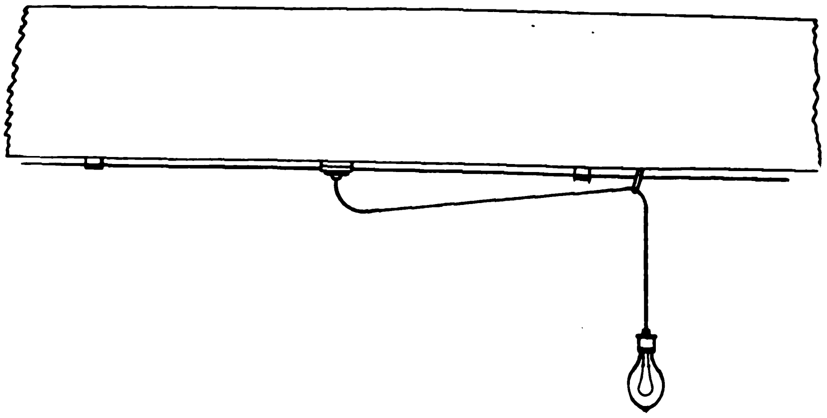

FIG. 6.

Another dynamo, illustrated in Fig. 3, failed to generate, although it was in good order a short time before. The first examination of the connections failed to disclose a defect, as all wires were in place, but when they were pulled to see if all connections were screwed down tight, the field coil connection under 2 was found broken. As the insulating covering still remained in place it appeared to be all right, but it was not until the broken piece was removed, the end cleaned for about 1 inch and inserted under the screws which were tightened, causing the trouble to disappear.

When doing such work it is always a good idea to shut off the current even if not more than 110 volts potential are carried. Failures to do this on the part of a certain electrician caused his screwdriver to assume the form shown in Fig. 4.

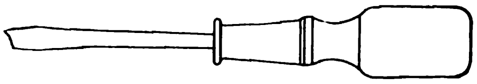

FIG. 4.

As a piece of hardened steel is not melted without a considerable heat, a large flash was in evidence but no further harm was done.

On another occasion the engineer of an electric power station handled one of the bus bars carrying 550 volts without harm. Why were the results so different? Probably because the engineer stood on a rubber mat and only touched one bus bar at a time. Visitors to electric plants are not advised to try a similar experiment as the result might be disastrous.

FIG. 5.

A machinist found that one of the incandescent lamps in his room was not burning to good advantage. Examination of it showed that good connections were not made between the feed wires and the socket. Taking out his knife he proceeded to scrape one of the wires to remove the insulation. When the steel touched the copper wire fire began to fly (the result is shown in Fig. 5), but no further harm was done.

When incandescent lamps are installed in our engine and boiler rooms, also in machine shops and other places, we expect that short circuits will annoy us, as vibration of buildings, running of belts, changing hangers and moving machines to other places will result in chafing of the insulation and breaking of wires as time advances.

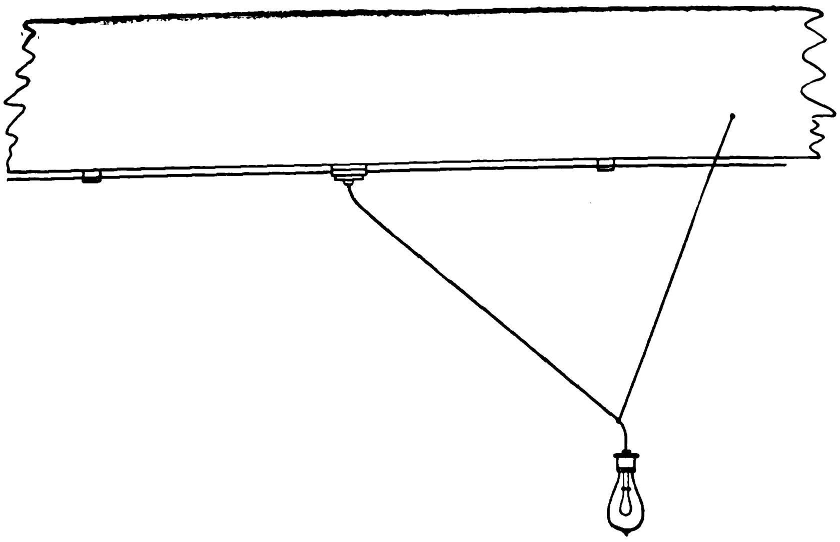

Fig. 7.

Sometimes an electrician will locate a lamp where it is not wanted, and in order to give better satisfaction the engineer or fireman may move it slightly by driving a staple into the timber overhead to support it in a new place, as shown in Fig. 6.

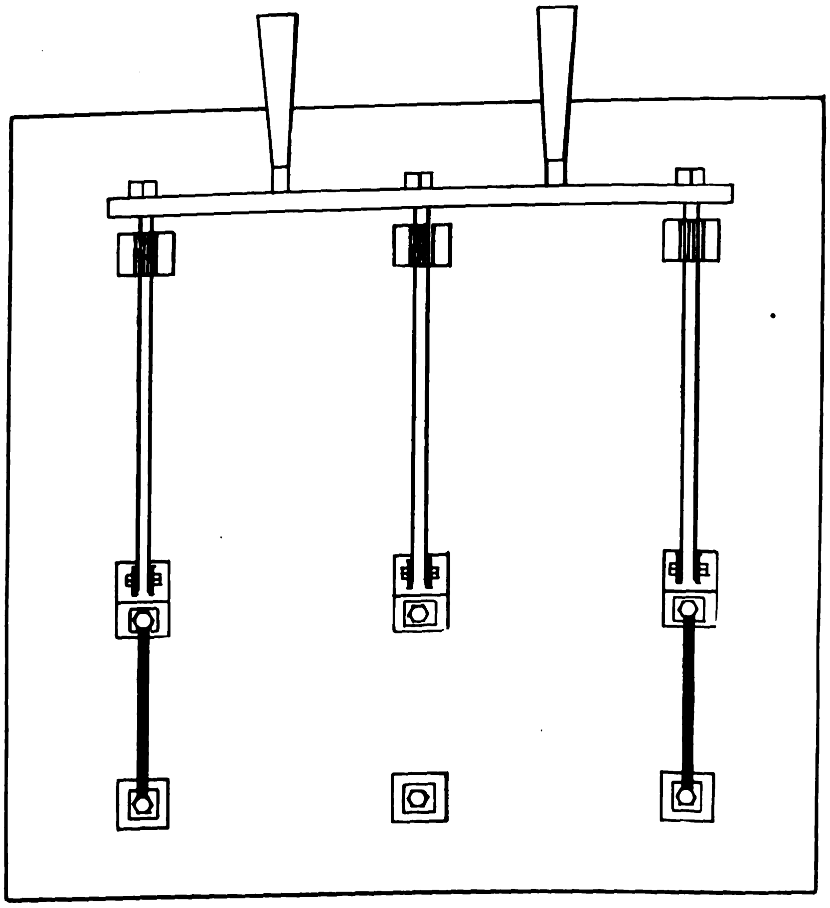

Fig. 8.

This is all right provided the staple and the wire are both wound with adhesive tape to protect the metal, although it might not meet the approval of some insurance inspectors. If the tape is omitted we should certainly expect that the iron staple and the copper wire would soon come in contact and make a "ground."

Fig. 7 shows another way of doing this by means of a stout string attached to the lamp cord. This looks harmless, but in a certain boiler room this plan has been adopted and worked well for a time until one day the ground detector on the switchboard indicated a ground connection. Investigation of the matter did not disclose the cause of trouble until this cord was removed, when the ground detector ceased to indicate a fault in the line. It is much better to take the time necessary to move the rosette to a new place.

Fig. 8 illustrates a 1,000 ampere switch on one of my switchboards. It was made for a three-wire system but two wires are enough for our use under given conditions. It is fitted with two handles, neither one of which is centrally located. If I use but one it does not throw up both sides alike, and if I use one hand on each am I not violating a very good and safe rule which says that only one hand shall be used at any one time in manipulating switches?

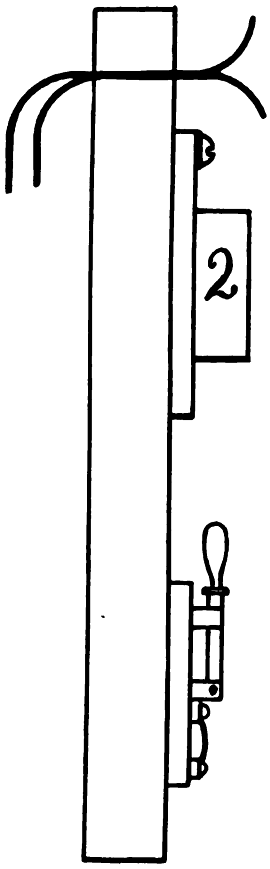

Fig. 9.

The object of this rule is to prevent an operator from getting both hands on live connections at once, thus causing a short circuit, which might be fatal. Would it not be much better to make such a switch with one large handle upon which a man could put both hands if necessary? It certainly would be safer.

Perhaps I am over-sensitive in the matter but if so there is a reason for it. Having used both hands in such a case, under conditions that were right for trouble, and experienced the sensation caused by the current used to supply 16 arc street lamps passing from one arm to the other through my body, the remembrance of it will last a long time and prevent future misdeeds along the same line.

Fig. 9 is an end view of another switchboard showing a voltmeter at 2 with the wires above it disconnected. Those pointing downward at the left are connected to the bus bars, which are not shown. Those at the right were formerly connected to the voltmeter, but are now separated from it. Their ends are wide apart so that they appear to be safe although the current is not shut off.

When the engineer thoughtlessly took hold of the left hand side and drew them through the small hole in the switchboard, the loose ends came together causing a short circuit which threw out a stream of fire more than a yard long, and narrowly missed the face of a spectator. The copper wires were burned as far back as they were uncovered, until the insulation separated them.

Nearly all such accidents are caused by acts which an engineer or an electrician knows will cause trouble, if time is taken for consideration, but it is not taken. Familiarity with the forces of nature is a very good thing provided it is not carried far enough to breed contempt, for that always works to our disadvantage.

LARGE THREE-PHASE ALTERNATORS FOR LONDON.

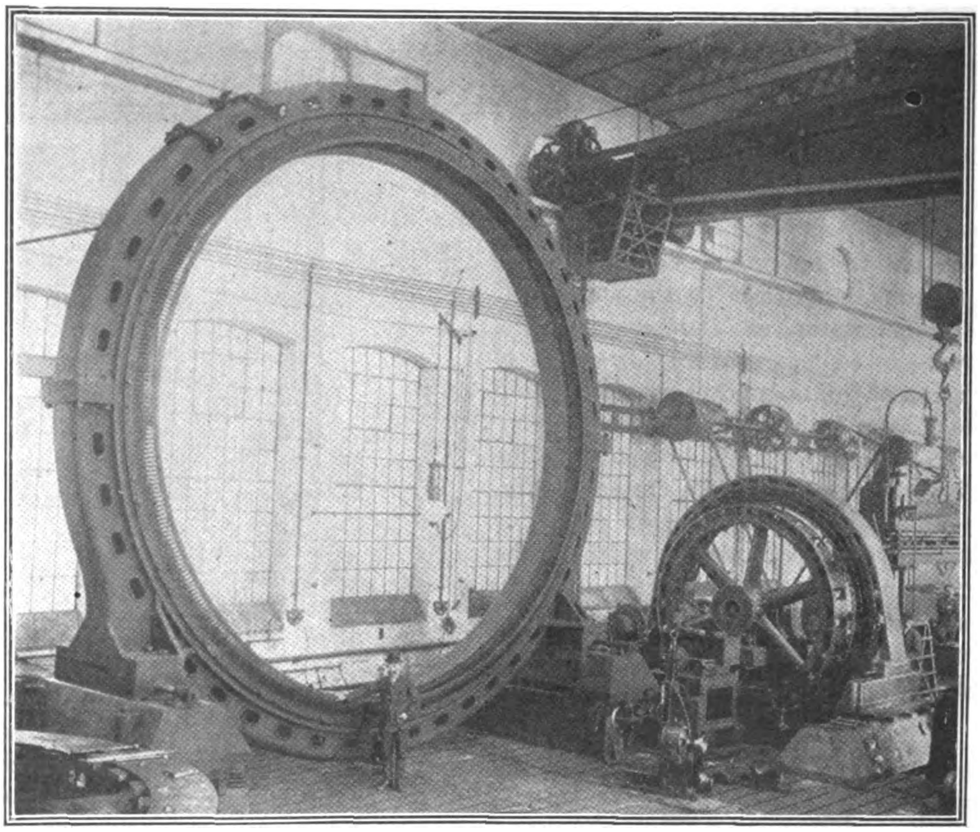
(From our London Correspondent.)

It is known that the London County Council has thus far been operating its conduit lines in the Southern District of London chiefly by means of electricity purchased from some of the electric light and power companies located there. These companies have naturally benefited greatly under this arrangement, for the demand for millions of units a year for a tramway load, notwithstanding the exceptionally low rate received, was just what two of the companies were in need of. They had been struggling with adversity for a time—indeed one of them was the celebrated Deptford undertaking, where, some 10 to 15 years ago, Mr. Ferranti's then gigantic high tension work was done, that pioneering work which led to more or less spirited controversy and ended so unhappily. From these generating stations the council took its supplies of energy to sub-stations for conversion and transformation down to the direct current line voltage.

But this arrangement will come to an end before long now, for the great power station at Greenwich—designed for 40,000 hp. capacity in 5,000 hp. generating sets—is getting near to completion, and early in the new year it is expected that the supply companies may have to find a new customer for their power.

The Greenwich station is on the bank of the Thames, so its fuel will be brought to the wharf by water, and ample condensing water is available. The boilers are of the Stirling water tube type, and a 6,600-volt three-phase alternating current is to be transmitted by underground cables to the various sub-stations as indicated above under the present agreement with the companies, for reduction by means of rotary transformers to 550 volts direct current.

Four of the three-phase generators have been made for the council by the Electric Construction Company of Wolverhampton. The armature, etc., of one of these alternators can be seen in the illustration. Each machine is designed to give a continuous output of 3,200 K.V.A. at a speed of 94 revs. per min.; the periodicity being 25 complete cycles per second per phase. The output of 3,200 K.V.A. is to be rated with a power factor of 94 per cent. The working pressure is 6,600 volts and the current per phase 280 amperes. The machines are to be equal to an overload for two hours continuously of 25 per cent. additional current, that is, 350 amperes per phase.



Large Three-phase Alternator for London Tramway Power House at Greenwich.

The field magnet system is constructed directly upon the rim of the engine flywheel, in which the amount of stored energy, when revolving at a normal speed, is 11,000 foot tons.

The alternators will be driven by Musgrave steam engines arranged for compound working, with high pressure cylinders vertical and low pressure horizontal, each set having two pairs of cylinders. The alternators are placed between the cranks. When the council's plans were made public criticism was offered because turbines were not adopted for this big station.

THE MAINTENANCE OF COMMUTATORS AND BRUSHES.*

BY S. LEES.

(*Concluded from page 161.*)

Before commencing to true up a commutator a large piece of stiff paper should be placed in the commutator pit to receive turnings, dust, etc., and the terminal blocks and any other bare current-carrying metal work kept well covered to prevent copper dust from being deposited thereon. The bearings should also be protected in order to exclude dust and grit from the oil-wells. It is a good plan to fix a piece of stiff paper over the end of the armature winding from where the connections to the commutator are made. This will effectually prevent turnings, etc., from lodging between the windings. A dab or two of shellac varnish will hold the paper covering securely in place.

A useful tool designed by the writer

---

*From the "Electrical Engineer," London.

for cleaning commutators is shown in Fig. 5. It is made up of well-seasoned pine, the two parts being glued and doweled together. To use, a piece of emery cloth is placed in the hollow of the tool, one end of which is fixed in the sawkerf at a, the other end being fastened down by means of two or three drawing-pins. A small quantity of oil should be smeared along the forward edge of the emery cloth to collect copper and emery dust, as these substances have a tendency to irritate the operator's nose and eyes. The tool is held firmly to the surface of the commutator, as indicated by the arrow—i. e., against the direction of rotation of the commutator—and should occasionally be given a lateral motion.

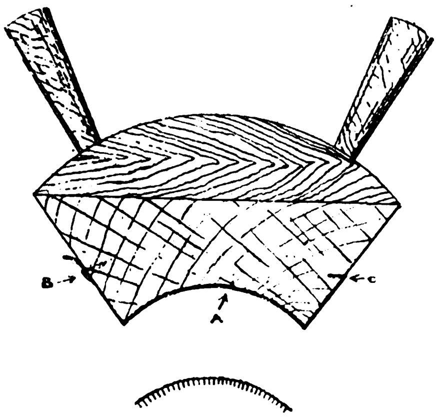


FIG. 5.

A commutator burnisher made by the Ediswan Company is illustrated in Fig. 6. In operation, a strip of emery or polishing cloth, the same width as the burner, is cut, and one end inserted under the clip at the front end; it is then turned back under the flexible backing and applied to the commutator. The flexible backing is made in such a manner that it easily adapts itself to the curve of the commutator, but it will not fall into depression on the surface. Thus the whole surface is evenly scoured with emery cloth to any degree of roughness required and afterwards polished.

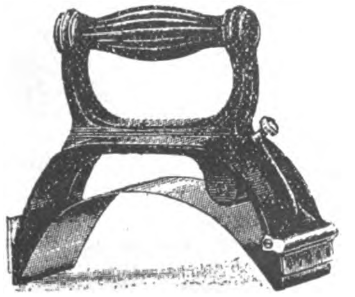

FIG. 6.

Another method of scouring commutators is to use a brick or block of carborundum. These blocks, measuring about 10 inches by 4 inches by 4 inches can be obtained in various grades from 10's to 80's. The writer was connected with a large station across the water where seldom anything else but "the brick" was put on the commutators, and, as may be imagined, quite a large number were used, as the frequent application of the brick only aggravated the formation of "flats." This method, whilst being convenient for a temporary job, is somewhat barbarous, as the commutator is only rough scoured, and when using, if the brick is not cleared of the copper cuttings, very frequently the commutator gets scored and fluted badly.

In order to reduce the wear of commutators and brushes to a minimum, the pressure on the brushes should be as light as possible consistent with sparkless commutation. This is most important where copper gauze brushes are used, as undue pressure on the brushes causes the commutator to get scorched, owing to the foot of the brush having become fused together in a more or less solid piece, thereby rendering trimming a daily operation, whereas, if properly set, and given a fair amount of attention when working, copper brushes should not require trimming oftener than once every two or three months. A brush jig is a useful tool for holding the brushes in when being trimmed. This tool may be either of wood or metal; if of the former a hard wood such as birch or teak is best, the top of the jig being slipped with a guide-piece of steel set to the angle it is desired to trim the brushes to. When using, care should be taken not to take a back stroke with the file; any stray strands of wire which may remain after filling are best removed by means of a pair of scissors or tinsmith's snips. One form of jig for holding two brushes is shown in Fig. 7.

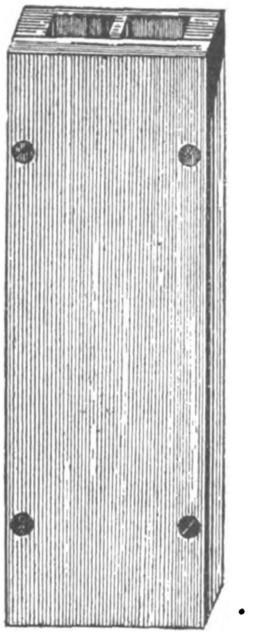

FIG. 7

Carbon brushes, which are now very extensively used, being hard and unyielding—unlike copper, gauze or wire—require bedding very truly to the curvature of the commutator in order to get sparkless running. If not bedded properly, when working, the face of the brush gets red-hot, and, finally, the brush crumbles away altogether. The best way to bed carbon brushes is to slip a piece of medium, say 1's, glass cloth or paper (cloth is preferable) between the brushes and the commutator with, of course, the business side of the glass cloth towards the brushes, and work it forwards and backwards until the brushes are bedded accurately to the curvature of the commutator. The glass cloth should be kept quite close to the face of the commutator during the operation, otherwise, if allowed to chatter or kink the brush gets chamfered down at the heel and toe, thus reducing the effective collecting area of the brush. These remarks apply equally well to carbon brushes of both the block and slab types, though the latter are not now much used owing to their fragility under working conditions. The best qualities of carbon brushes have a fine close grain, wear slowly and uniformly, and present a very soft frictional surface. Carbon brushes are usually plated with copper or nickel on the parts which come into contact with the brush-holder, and care should be taken that the plating is never allowed to come in contact with the commutator, the plating being stripped off as the brush wears away. For a good quality of carbon brush the current density to be used may be taken at about 30 to 50 amperes per square inch of sectional area, this varying with different types of machines and conditions of working.

An improved type of metal brush, which possesses many advantages over the ordinary gauze or bunched wire type, consists of a number of very thin laminations of an anti-friction metal having a higher electrical resistance than that of copper. The laminations are sandwiched between copper plates, and the whole held firmly together by means of two spring cheeks for about three-quarters of their length, the remainder of the brush being left free to allow of greater flexibility. Owing to the peculiar construction of this brush, each armature coil when passing under the brush is cut in and cut out through resistance, thus tending to reduce sparking. Another patent brush consists of sheets of anti-friction metal rolled to about the thickness of tissue paper, folded and formed under pressure to the size of the brush-holders.

The metal of which these brushes are made has copper for its basis, and being very ductile, it possesses all the advantages of an anti-friction metal and is not affected by rubbing. With this type of brush practically no trimming is required, the corners being simply rounded off, and the brush allowed to form its own bedding. It is essential to their good working that the commutator be perfectly true, and no lubricant of any kind whatever used on the commutator.

A great diversity of opinion exists among engineers as to whether anything of the nature of a lubricant should be used on commutators. Carbon brushes, if kept dry when running, have a tendency to produce a somewhat disagreeable screeching noise. The slightest trace of oil will usually stop this for a time, but the use of oil cannot be recommended, as, unless it is applied very sparingly, the oil carbonizes and causes "flashing." Pads of oil, soaked rag, or waste are messy things to use, and are apt to cause trouble if left about open parts of running machinery. A substance which the writer has used for many years with success on machines fitted with carbon brushes is refined paraffin wax. For convenience in handling, the wax may be moulded in the form of round sticks. If rubbed lightly on the commutator occasionally, the wax should soon produce a good skin on the surface of the commutator. Sometimes carbon brushes may be improved by immersion for a few hours in melted paraffin wax. To keep copper brushes in good condition the foot of the brush should always be quite clean and flexible, and never allowed to get splayed out. A mixture used by the writer with excellent results on commutators with copper brushes is made up of the following ingredients: paraffin oil, five parts; olive oil, three parts; ammonia (spirits of hartshorn), two parts.

As mentioned before, the brushes should bear on the surface of the commutator with the least pressure consistent with sparkless commutation. The best pressure to use varies greatly with the many different types of brushholders and brushes, and may be anything from a few ounces to as much as 6 lbs. or 8 lbs. Copper gauze brushes, if kept in good order, require about one-tenth of the pressure of that of carbon brushes. With the box or floating type of brushholder the pressure on the brush is greater than in those of the hinged or swinging-arm type. In the former the brushes, being usually a good fit to prevent chattering, are apt to stick if dirt or grease is allowed to accumulate between the brush and box sides, hence it is well to see that the boxes be kept quite clean and smooth.

A weak point in nearly all types of brush-holders, and one which gives much trouble at times, is the bondings. The bonds frequently get broken owing to the vibration which they are subject to when working, the break occurring usually close to the point of connection,

TABLE A.—PARTICULARS OF BRUSH-HOLDERS AND BRUSHES.

Size of machine.			Brush-holder.	Brushes.					Remarks.
No.	Kw.	Vol s.		Quality.	Actual wearing length.	Pressure on brush.	Type.	Wear.	
1	3	220	Swinging arm type.	B	1 inch.	1½ lbs.	Fixed block or wedge type.	Average life = 200 running hours.	Commutator blackened frequently, necessitating regular cleaning. After three months' service, commutator worn out of true nearly ⅛ inch.
2	7	540	Swinging arm type.	A	1 inch.	1½ lbs.	Fixed block or wedge type.	After 5,000 running hours, wear = ⅜ in.	Commutator, after nearly two years' service, in excellent condition. No cleaning required.
3	20	440	Swinging arm type.	B	1 inch.	1½ lbs.	Fixed block or wedge type.	Average life = 200 running hours.	Commutator trued up after 1,200 running hours.
4	20	440	Swinging arm type.	A	1 inch.	1½ lbs.	Fixed block or wedge type.	After 5,000 running hours, wear = ¼ in.	Commutator, after nearly two years' service, in excellent condition; cleaned occasionally.
5	100	550	Fixed box type.	C	1½ inch.	5 lbs.	Floating or box type.	Average life = 1,500 running hours.	Brushes trimmed—i. e., bedded—on an average about once every 100 hours' run. Commutator trued up after 3,000 running hours.
6	100	550	Fixed box type.	D	1½ inch.	5 lbs.	Floating or box type.	After 2,000 running hours, wear = $\frac{5}{16}$ in.	Commutator in excellent condition, no cleaning required. Since the initial bedding the brushes have not been trimmed in any way, the brush faces being in perfect condition.
7	100	550	Fixed box type.	E	1½ inch.	5 lbs.	Floating or box type.	After 200 running hours, wear = $\frac{1}{32}$ in. (about).	Brushes very hard and brittle. Commutator after a short time became blackened, and scorched badly, necessitating truing up.

particularly if the bonds have sweated connections. Many types of brush-holders depend almost entirely on the bonds for their efficient working. The writer has known of cases where defective bonds have been the cause of brushes and holders getting red hot. It is essential to the good working of any type of brush and holder that a continuous metallic path be provided for the passage of the current from the brush to the brush spindle or terminal, as moving joints cannot be depended upon; even if a close fit when new they sooner or later give trouble owing to the increased resistance which is set up at the joints as they become worn. Another weak point in nearly all holders of the hinged or swinging-arm type is that no provision is made for preventing the metal part of the holder from rubbing on the commutator when the brushes have been allowed to wear down too far. In the fixed box type this cannot occur owing to the brush-holder being rigidly fixed, the brush only being movable.

The writer has recently made a series of tests on various types and qualities of carbon brushes. The tests were carried out under everyday working conditions on machines ranging in size from 3 kw. to 100 kw. The results are shown in tabulated form in Table A. Type D is made by an American firm, the brushes being obtainable through a well-known English selling-house. Type A is manufactured in France, the firm having a direct agency in London. The writer concludes from the foregoing that it pays in the long run to use a good quality of carbon brush, even though at first sight the prices may be rather high when compared with those of the poorer qualities. In the table, the brushes of machines (1), (2), (3) and (4) are all of the same size, quality A being the highest priced, B quality being about 40 per cent. cheaper. Machines (5), (6) and (7) have brushes all of the same size, D quality being the highest priced, qualities C and E being, respectively, 30 per cent. and 40 per cent. cheaper. With some qualities of mica, particularly those of the "made-up" variety, the small particles of carbon and copper produced by wear become so firmly embedded in the mica that sometimes nothing short of turning or grinding up of the commutator will remove them.

Telegraphone Show.

There was exhibited in Boston last Friday, for the first time in America, the new telegraphone, invented by Vlademar Poulsen, of Denmark, who brought it to this country. The apparatus was shown to the scientists of Harvard. It is so compact and simple that it is contained in a small mahogany box.

CENTRAL ELECTRIC LIGHT AND POWER STATIONS.

The Bureau of the Census has just published a report on central electric light and power stations for the year ending June 30, 1902, prepared under the supervision of Mr. W. M. Steuart, chief statistician for manufactures. It is the third of a series of reports on the operation and utilization of electric current. In addition to the text, which was prepared by Mr. T. Commerford Martin, of New York City, expert special agent, there are elaborate tables and an interesting series of illustrations.

Electric lighting dates back only to the beginning of the last century, while the history of central stations proper belongs only to the second half or, more strictly speaking, to the last quarter of the century.

In the last quarter of a century a total of over 250,000,000 lamps has been produced, or not less than 10,000,000 a year.

For convenience in study the various electric stations have been divided into two grand classes: First, those operated by individuals or corporations, and second, those operated under municipal control. Each of these classes is subdivided into, first, those doing a purely electric business, and second, those operated in connection with other industries. The latter are designated composite stations.

The growth of this industry is shown by the following figures: From 8 stations beginning operation in 1881 the number rose to 100 in 1886, to 208 in 1889, and to 247 in 1892. During the following years of depression the number of new stations fell; but in 1895, though a time of financial stringency, it again rose to 239. In 1898 it reached 277, or more than the number beginning operation in the entire period from 1881 to 1886, inclusive. The number for 1901 was 250, and for five months of 1902 it was 146. In the 20 years from 1881 to 1901, inclusive, an average of 165 private and municipal stations have begun operation each year. The spread of the agitation for municipal ownership of public service enterprises is illustrated in a somewhat striking manner. Of the 815 municipal stations enumerated, only 68 had been installed up to 1889. In that year 40 were introduced, and in 1895 the number of new stations reached 73, increasing in 1898 to 82. The returns for 1902 indicate that the ratio was fully maintained in the census year.

In 1902 there was in the United States 3,620 central electric stations, with a cost of construction and equipment of $504,740,352 Employed were 6,996 salaried officials and clerks with salaries amounting to $5,663,580; and 23,300 wage-earners with wages amounting to $14,983,112. The gross income was $85,700,605, comprising $84,186,605 from sale of current and $1,514,000 from other sources. Total expenses were $68,081,375. The total output of stations for the year, in kilowatt hours, was 2,507,051,115. The number of arc lamps was 385,698 and of incandescent lamps 18,194,044.

There has been a striking change in the character of service is these stations. In the earlier days of the industry nearly all the stations were installed for the purpose of furnishing current for arc lighting, while to-day the bulk of current is supplied for incandescent lighting, motor power, and miscellaneous service. This last includes charging telephone exchanges, batteries for boats and automobiles; pumping; hot water, steam and electric heating; electric current; and nickel plating and electroplating.

Private stations form by far the largest portion of the industry, constituting 77.5 per cent. of the total number of stations in operation during 1902. Their income from sale of current was $78,735,500, or 91.9 per cent. of gross income, the expenses of operation 92.3 per cent. of the total, while they gave employment to 89.4 per cent of the total number of wage-earners engaged in the industry and paid 90.5 per cent. of the total amount of annual wages. The primary power plant equipment of these stations formed 91.3 per cent. of the total horse power of all stations while their generating equipment formed 90.6 per cent. of the total horse power of all dynamos. The kilowatt hour output of private stations formed 92.2 per cent. of the total, and the arc lamps in such stations formed 86 8 per cent. of the total number wired for operation.

The comparison of the income of the two classes of stations is not a fair indication of their earning capacity, because of the gross income reported for municipal stations. Of this gross income, $6,836,856 resulted from the sale of current and included income from public service which was necessarily largely, if not wholly, a matter of estimation.

The private stations employed 20,863 wage earners, who were paid $13,560,771, and 6,046 salaried officials and clerks with salaries amounting to $5,206,199; while the municipal stations employed 2,467 wage earners, who were paid wages amounting to $1,422,341, and 950 salaried officials and clerks, who were paid $457,381.

The cost of construction and equipment of the municipal stations was only 4.4 per cent.; their income from sale of current, 8.1 per cent.; their expenses, 7.7 per cent., and the horse power capacity of their power and generating plants, 8.7 and 9.4 per cent. respectively. The output of such stations was 7.8 per cent. of the total kilowatt hours produced by all the stations, while their arc lamps were 13.2 per cent. and their incandescent lamps 8.7 per cent. of all the lamps reported for the country.

In addition to controlling practically the entire industry, the average private station is much larger than the average municipal station. Considering the total of 2,805 private stations, it appears that the average total expense per year per station was $22,401, as compared with $6,467 for municipal stations. The private stations gave employment on the average to 7.4 wage earners, while the municipal stations gave employment to 3. The average private stations reported 823,938 kilowatt hours per year, as compared with 240,373 for the municipal stations.

THE AMERICAN STREET RAILWAY ASSOCIATION'S ANNUAL MEETING.

This week will prove an important one for the street railway industry, as the 24th annual meeting of the American Street Railway Association begins to-day in Philadelphia at the Bellevue-Stratford Hotel and the Philadelphia Museum—the exhibit of apparatus taking place at the Museum. Following is the programme for the week:

AMERICAN STREET RAILWAY ASSOCIATION.

Wednesday, September 27, 10 A.M.—Address of welcome. Address of the president, Mr. W. Caryl Ely; approval of minutes of last annual meeting; report of the executive committee; report of the secretary-treasurer; report of standing committees; report of the reorganization committee; consideration of, and action on, new constitution and by-laws; appointment of nominating committee. Paper on "Notes on the Design of Large Gas Engines with Special Reference to Railway Work," by Mr. Arthur West; paper on "The Application of Gas Power to Electric Railway Work," by Mr. J. R. Bibbins; paper on "Single-Phase Railway System," by Mr. Chas. F. Scott; 8 P. M.—Theatre party at New Lyric Theatre.

Thursday, September 28, 10 A. M.—Unfinished business; new business; report of nominating committee; election of officers for ensuing year; 8 P. M.—Banquet at the Bellevue-Stratford Hotel.

STREET RAILWAY ACCOUNTANTS' ASSOCIATION OF AMERICA.

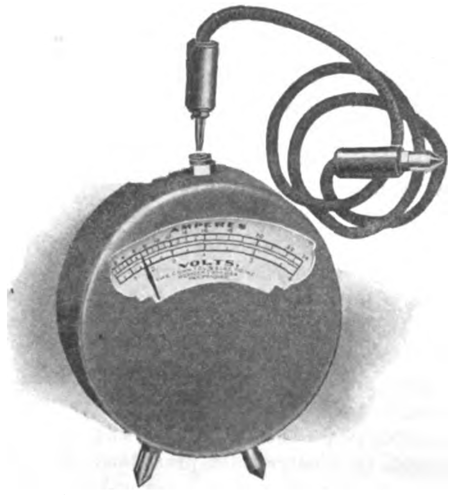
Thursday, September 28, 2 P.M.—Annual address of President W. G. Ross, Montreal, Canada; annual report of the executive committee; annual report of the secretary-treasurer; appointment of convention committee on nominations; appointment of convention committee on resolutions; report on proposed reorganization of the American Street Railway Association.

Friday, September 29, 10 A.M.—Annual report of standing committee on standard classification of accounts; report of committee on international form of report.

Saturday, September 30—10 A.M.—Unfinished business; report of convention committee on resolutions; report of convention committee on nominations; election and installation of officers.

New Connecticut Volt Ammeter.

Whenever batteries of any description are employed it is absolutely necessary that some means is at hand to test their qualities. If even one of the cells is worn out the efficiency of the others are lost, and when these cells are used to supply current for telephone transmitters, the difficulty in making one's self heard is sometimes insurmountable. The Connecticut Telephone and Electric Company, of Meriden, Conn., has placed upon the market a new type of volt ammeter which is invaluable for this purpose and which is shown in the accompanying illustration. This instrument is especially designed for testing batteries and is coming into general use everywhere. It is made up in two styles, one as a combination voltammeter and the other reading in amperes only. The scales are graduated from 0 to 30 amperes and from 0 to 6 volts, and are very carefully calibrated. The arrangement of the needle supports permits very delicate and accurate reading. This instrument can be used without the cord shown by holding it in the hands. This is an exclusive "Connecticut" feature. This instrument is guaranteed by the company to be accurate, durable and free from mechanical defects. The company will be pleased to furnish particulars to parties interested.



A NEW VOLT AMMETER.

ELECTRICAL PATENT RECORD.

LETTERS PATENT ISSUED SEPT. 19, 1905.

Electric Railways and Appliances.

799,704. Electric Railway Signal. Joseph Bartl, Chicago, Ill. Filed Feb. 26, 1904.

799,752. Signaling System for Railways and the Like. Claud D. McPhee, Arnprior, Canada. Filed May 5, 1905.

800,022. Train-Operated Time-Signal System for Railways. William B. Severance, Manchester, N. H. Filed May 29, 1905.

800,121. Car-Fender. Joseph W. Seibert, Washington, Pa., assignor of one-third to Elias Lewis, same place. Filed July 20, 1905.

Electric Lights and Appliances.

799,655. Dash Electric Headlight. John Kirby, Jr., Dayton, O., assignor to the United States Headlight Company, Buffalo, N. Y. Filed Dec. 10, 1904.

Electrical Machinery and Apparatus.

798,684. Electric Fuse. Henry N. Snyder and Lewis A. Hardison, Santa Paula, Cal. Filed Aug. 8, 1904.

779,720. Electromagnetic Clutch. Henry H. Cutler, Milwaukee, Wis., asssignor to the Arnold Clutch Company, same place. Filed Sept. 22, 1902.

799,790. Electromagnetic Lock for Automatic Circuit-Breakers. John D. Hilliard, Jr., Glens Falls, N. Y., assignor to the General Electric Company. Filed Nov. 17, 1902.

799,805. Power-Transmission Mechanism. Charles G. Simonds, Schenectady, N. Y., assignor to the General Electric Company. Filed April 8, 1904.

799,816. Block-Signal System. Harold E. White, Schenectady, N. Y., assignor to the General Electric Company. Filed Feb. 11, 1904.

Telephones and Telephone Apparatus.

799,658. Telephone Signal Apparatus. David F. Laughlin, Clyde, Kan., assignor of one-half to Franklin H. Butler, same place. Filed June 13, 1905.

799,722. Portable Support for Telephones. Augustus G. Davis, Baltimore, Md. Filed Jan. 5, 1905.

799,760. Service Meter Apparatus for Telephone Exchanges. Charles E. Scribner, Jericho, Vt., assignor to the Western Electric Company, Chicago, Ill. Feb. 23 1904.

799,887. Party-Line Telephone System. Mary A. Breadheft, Indianapolis, Ind., executrix of Samuel Martin Gant, deceased, assignor to Sara O. Wilson. Filed Feb. 24, 1903. Renewed Feb. 16, 1905.

Miscellaneous.

799,678. Insulating Material. Dominick W. Sharkey, New York City. Filed Nov. 28, 1904.

799,726. Insulator. Ernest J. Foreman, Trinidad, Col. Filed March 16, 1905.

799,861. Electrolytic Apparatus. Guy L. Meaker, Evanston, Ill., assignor to the American Steel & Wire Company of New Jersey. Filed Feb. 1, 1905.

799,896. Electric Contact Device. Robert W. Farrington, Buffalo, N. Y. Filed Sept. 23, 1904.

800,052-053. Conduit and Angular Conduit for Electrical Wiring. Henry C. Ayres, Greenville, O., assignor to the Adjustable Fixture & Manufacturing Company, same place. Filed March 13, 1905.

800,054. Conduit for Electrical Conductors. Henry C. A res, Greenville., O., assignor to the Adjustable Fixture & Manufacturing Company, same place. Filed March 13, 1905.

900 055. Cover for Electrical Conduits. Henry C. Ayres, Greenville, O., assignor to the Adjustable Fixture & Manufacturing Company. Filed March 13, 1905.

800,084. Electric Water-Heater. William C. Dice, Seattle, Wash., assignor, by mesne assigments, to the Climax Electric Heater & Manufacturing Company, same place. Filed Dec. 6, 1904.

THE TELEPHONE WORLD.

$50,000,000 Telephone Company to Make War on the Bell.

A certificate showing increase of capital stock from $500,000 to $50,000,000 by the New York Independent Telephone Company was filed Saturday morning last in the office of the Secretary of State at Albany.

The stockholders signing the certificate, which is acknowledged in Monroe County, are Harrison C. Durand, Harry C. Sickels, William F. Dwyer, J. Henry Howe, Arthur C. Frith, George S. Bixby and George R. Fuller.

A dispatch from Pittsburg September 23 says that persons who have large interests in the Independent telephone movement state that all is now ready for a great battle, and that the certificate of an increase in the capital stock of the New York Independent Telephone Company from $500,000 to $50,000,000 filed at Albany, N. Y., was evidence of the fact.

Announcement will soon be made of the financial backing of the new $50,000,000 company, it is declared, and the list of shareholders will contain representatives of powerful financial institutions. Pittsburg's interest in the new company is a large one.

A meeting of the Independent interests has been in progress in St. Louis for several days and many questions in connection with the operating union have been under consideration.

Five-Cent 'Phones for New York.

A five-cent telephone rate is proposed for New York City by Thomas F. Ryan, who, according to a report which came from St. Louis Friday, is the backer of a telephone syndicate which proposes to combine all the cheap telephone companies in the country under one management.

P. A. B. Widener, William H. Page and the Morton Trust Company are mentioned as being interested with Mr. Ryan in the project. It is said that important plans of the concern are to be announced in a few days.

A combination of municipalities and Independent telephone companies and manufacturers has been formed in Toronto, Canada, for the purpose of fighting the Bell Telephone Company, and securing favorable legislation from both the Provincial and Federal Parliaments.

At a recent public sale in Owingsville, Ky., the Bath fiscal court's special commission sold the telephone franchise rights over every turnpike in Bath County to the companies whose lines now run over the roads. A rate of $1 per mile was made over all the roads.

It is now stated by the officers of the Columbus, O., Citizens' Telephone Company that November 1 will see the completion of the work of transferring subscribers to the automatic switchboard, and that soon after a new directory will be issued.

The Independent Telephone Company of Portland, Ore., has sold $1 000.000 worth of bonds, the money to be used in the construction of a long-distance line between Portland and British Columbia cities.

The Star Line Telephone Company of Olney, Ill., has been dissolved.

Keystone Conduits Cannot be Sold.

According to a Philadelphia paper, the ownership of the Keystone Telephone conduits, which have been the subject of so much controversy, and which were the cause of the coolness which sprung up between I. W. Durham and John M. Mack, eventually leading to a huge political quarrel, is likely to be so permanently vested in the Keystone Telephone Company, that no other corporation can possibly control them.

A special meeting of the stockholders of the Keystone Telephone Company will be held in Camden, N. J., on October 2 for the purpose of changing the articles of incorporation so as to prevent the directors of the company from selling real or personal property of the company without a vote of the stockholders.

This step is due to the policy of the new blood which has been injected into the Keystone board. Control of the conduits came so near to passing to the Philadelphia Electric Company that the present board has determined to take out of the hands of the directors authority to dispose of the company's assets, without the approval of the shareholders. This will probably fix for all time the ownership of the conduits, but it will not prevent the directors from renting some portion of the ducts to a desirable tenant and at a price which will be remunerative to the Keystone Telephone Company. The step will also tend to prevent any rival telephone company wresting away the conduits from their present owners. As this policy was known to the insiders it probably accounts for the recent strength of the Keystone shares.

After accepting a franchise for 21 years and agreeing to pay to the city of Perth Amboy, N. J., a percentage of its gross receipts, the Hudson & Middlesex Telephone Company startled the water board by its offer to build and maintain a private telephone line from the City Hall to the Runyon water station, eight miles away, for $200 a year. Nearly a mile of the line will be a cable under the Raritan River. The New York & New Jersey Company asked $275 a year for the cable under the river, and wanted the city to build its own line from the cable end to Runyon. The Hudson & Middlesex offer was accepted and a contract will be made for 20 years.

The Mutual Telephone Company has just been organized by prominent business men of Tower Hill, Ill. The latest improved switchboard has been ordered and the system will be installed at once. Already a number of farmers are arranging to attach party lines, and will have connection with the entire county. The officers of the new company are: President, E. G. Foster; vice-president, Dr. A. C. Jackson; secretary-treasurer, J. C. Pitzer; manager, L. B. Fluckey.

The Madrid, N. Y., Telephone Company has certified to the Secretary of State that the amount of its capital stock has been increased from $10,000 to $15,000, consisting of shares of $100 each. The amount of capital stock paid in is $9 900. The certificate is signed by Frederick J. Merriman and G. P. Horsford.

Reduction of Rates for the Bronx.

Reductions in telephone rates in the Bronx will take effect October 1.

The rate for a business service of 600 messages has been reduced from $54 to $48. For a resident service of 500 messages the rate will be $39 instead of $48. the former rate. Excess local messages will be charged for at five cents each, the old rate being seven cents.

A material reduction has been made in the charge for a private branch exchange service. The existing rate is the same as that charged in Manhattan. The new rate will be $150 for a switchboard, two lines to the central office, two telephones and 2,400 messages a year.

The instrument statement of the American Telephone & Telegraph Company for August shows gross output of 127.928. an increase as compared with last year of 29 636; net output 69.538. an increase of 17.806. Since December 31, 1904. the gross output has been 1.140.445, an increase of 370.141; net output, 734,534, a gain of 300,802. The total number of instruments now outstanding is 5,215,098, an increase of 1,001,849.

Aroused by the announcement of the Bell Telephone Company that it would charge what is deemed an exorbitant rate. the residents of Newtown, Pa., recently held a meeting and decided to build their own local telephone line. Edward P. Hicks was elected president and J. Herman Barnsley secretary. The company will start with $5,000 capital. One hundred and sixty shares of stock were subscribed for at the meeting.

The board of mayor and aldermen of Newton, Miss., has granted a 25 year franchise to E. E. Grassett and J. J. Mott, Jr., of Meridian, to establish and operate an Independent telephone system there. The same people are interested in several private lines that connect with towns adjacent to Newton, and they will also have connection with the Home Telephone Company at Meridian.

The Camden, N. Y., Telephone Company at a recent meeting elected the following officers: President, L. P. Havlin; vice-president, B. D. Stone; secretary, B. S. Osborne; treasurer, M. Stanley. The company is enjoying a largely increased business.

The Delaware & Atlantic Telephone Company has notified the Wenonah, N. J., borough council of its acceptance of the ordinance recently passed governing the franchise of the company in that borough. The company will give all night service and make other concessions.

The Farmington, Mo., Telephone Company was lately sold by T. P. Pigg to local capitalists for about $60 000, The system is one of the largest in Missouri outside of the large cities, having switchboards at Farmington, Flat River, Bonne Terre and Deer Run.

The Consolidated Telephone Company of Buffalo, N. Y., which controls the Frontier Telephone Company, has purchased the Elma Telephone Company of Elma, N. Y., and the Marilla Telephone Company of Marilla.

GENERAL ELECTRICAL NEWS.

LIGHTING.

Albion, Pa.—The council is considering the question of having an electric light plant and waterworks.

Auburn, Cal.—At the last meeting of the city trustees it was decided to sell the old gasoline street lights and put arc lights in their places.

Austin, Tex.—This city is considering an appropriation of $10,000 for improving the waterworks and electric light plant. John H. Robinson, Jr., is a member of the water and light commission.

Broad Albin, N. Y.—The Broad Albin Electric Light & Power Company, capitalized at $50,000, has been formed with the following directors: W. P. Judson, H. C. Finch and Anna L. Judson.

Chapman, Kan.—This town is agitating the question of electric lights.

Clyde, N. Y.—The Clyde Gas & Electric Company has been incorporated with a capital stock of $25,000, by Thomas W. Summers, of Ithaca; George S. Sheppard and William T. Morris, of Penn Yan.

Fisher, Ill.—A franchise was granted to the Wardlow Electric Lighting Company of this village to carry on and maintain an electric light plant here.

Fort Worth, Tex.—Sam Davidson and others have applied for a franchise to construct and operate an electric light and power plant, and steam heating plant.

Hamilton, O.—The board of directors of the Hamilton Gas & Electric Light Company passed a resolution ratifying the expenditure of $250,000 in improvements on the electric light plant and the Otto Coke Works.

Hillsboro, Ill.—The Hillsboro Electric Light & Power Company has increased its capital stock from $5,000 to $50,000.

Hyattsville, Md.—At a recent meeting of the citizens steps were taken which, it is believed, will result in the establishment of an electric lighting plant in this city sufficiently large to light its streets, as well as those of the neighboring towns and villages. For further information address William P. Magruder or W S. Holton.

Jackson, Ga.—This city has voted to issue $39,000 5 per cent. waterworks and electric light bonds.

Kalamazoo, Mich.—The American Arc Lamp Company, successor to the Lea Electric Manufacturing Company at Elwood, Ind., has lately removed to this city.

L'Anse, Mich.—Plans for the new municipal electric lighting plant for this village have been completed by Liebert and MacNeil, of Calumet.

Morehead, Ky.—Cincinnati capitalists lately closed a contract with J. W. Riley, of this place, to erect a modern electric light plant here at once. The plant will cost $15,000.

Muskogee, I. T.—The Muskogee electric light and power plant was lately destroyed by fire. The loss is between $3,000 and $5,000.

New York City.—The Rooney Electric Light Company has been formed to manufacture electric lamps and appliances with a capital of $50,000. The incorporators are: John J. Rooney, Scarsdale; Francis J. Rooney and John Rooney, both of Brooklyn.

Port Dickinson, N. Y.—An electric lighting system is soon to be installed in this village.

Sand Point, Ida.—It is expected that about November 1 an electric light plant will be in operation here.

Scottburg, Ky.—This place is to have a water plant and an electric light plant in operation by December 1.

Shelbyville, Ind.—The Shelbyville Light & Power Company's plant, which has been operated by a receiver since its failure, has been purchased by C. F. Streeter of New York. The consideration was $36,000. It was given out that F. M. Knuckles, who was receiver of the plant, will continue in charge of the business.

Wampum, Pa.—The proposition to issue bonds in the sum of $13,500 for the purpose of erecting both a municipal water and electric lighting system was lately carried.

Wheaton, Minn.—At a recent meeting of the Commercial Club a committee of three business men was appointed to make the necessary arrangements for a new electric light plant for this city.

STREET RAILWAYS.

Altoona, Pa.—Application will be made September 28 for a charter for an electric railway line from this city to Patton.

Anderson. Ind.—H. C. Stilwell is in Kansas City, Mo., where he and George F. McCulloch will spend some time perfecting the plans whereby they will build an electric interurban railway 60 miles long.

Beaver Dam, Wis.—Joseph H. Larimer, president of the Indianapolis & Ohio Traction Company of Indianapolis, Ind., has been here looking over the prospects for an interurban electric line from Fond du Lac to Madison by way of Waupun and Columbus.

Cleveland, O.—This State is to have another interurban electric railroad. The company has been organized under the name of the Cleveland, Berea & Southern Railway Company. The incorporators are C. C. Downs and W. S. Mitchell.

Dallas, Tex.—A charter for the proposed electric railway between this city and Sherman will be filed within a few days.

Evansville, Ind.—The city council has granted a franchise to the Evansville & Mt. Vernon Traction Company.

Frederick, Md.—Promoters of the Washington, Frederick & Gettysburg Electric Railway Company announce their purpose to revive this project and say that the primary plan of the company, which is to build a railway between this city and Thurmont, will be carried out. A director of the road states that the survey has been completed, with the exception of a few changes which will probably be made.

Ft. Wayne, Ind.—Mr. Norford is at the head of an engineering party that is surveying a route for another electric line north from this city to Auburn.

Lawrenceburg, Ky.—An electric line may be built between this city and Tyrone.

Martin's Ferry, O.—There is a report that a new traction line will be built between this place and Canal Dover.

Princeton, Ill.—Another electric interurban line will be built here from the present western terminus.

Pomeroy, O.—Work will soon be commenced on the proposed electric line from this city to Zanesville.

Saugatuck, Mich.—An electric road connecting this city and South Haven is practically assured. Franchises have been granted in the village of Douglas and the township of Saugatuck.

Schenectady, N. Y.—Charles C. Kremer, of Schoharie, has been here in connection with the proposed Schenectady & Stamford Electric Railway. It is said the company will be incorporated in the near future.

Tishomingo, I. T.—The Washita Valley Interurban & Electric Railway Company has been incorporated here with a capital of $12,000,000. It is proposed to build an electric railway from Shreveport, La., to Anadarko, Okla., following the valleys of the Red and Washita Rivers. The road will traverse a very fine country and connect many good sized towns.

Watervliet, Mich.—At a recent meeting of the village council a franchise was granted to W. A. Baker for an electric road from this place to Paw Paw Lake.

POWER PLANTS.

Elko, Nev.—The Intermountain Power Company of this city has been incorporated with a capital stock of $1,500,000 by E. J. Raddats, C O. Ellingwood, W. J. Craig and others. The company will construct a power plant for the purpose of furnishing power for motive and lighting purposes.

Ft. Wayne, Ind.—Chief Engineer Elliott, of Cincinnati, has lately been here consulting with Manager Emmons about the plans for the power plant for this city.

BIDS WANTED.

Chicago, Ill.—Sealed proposals will be received until October 5 for furnishing and delivering in this city 55,000 incandescent electric lamps. Envelopes containing proposals to be indorsed Proposals for Incandescent Electric Lamps. M. C. Martin, Chief Quartermaster, Federal Building.

Duluth, Minn.—The Great Northern Power Company will build a distributing station, and bids will be called for the construction of same.

Washington, D. C.—The Navy Department, through the Bureau of Supplies and Accounts, is inviting sealed proposals until October 31 for furnishing Western Navy Yards with the following supplies: Schedule 159, wattmeters, electric traveling crane; schedule 160, motors and electric traveling hoists. On October 10 the Bureau will open bids for furnishing Eastern Navy Yards with the following: Schedule 147, dynamotors, insulators, testing sets, wire, rheostats and miscellaneous electrical supplies; schedule 148, armored cable; schedule 149, motors, conduit. On October 17 the Bureau will open bids for furnishing Western Navy Yards with the following: Schedule 141, conduit, cable, wire, electric fittings; schedule 142, motor, motor drive outfit, electric traveling hoist. Blank proposals can be obtained on application to the Bureau at Washington, and those for Eastern Yards can also be obtained at the Navy Pay Office in New York.

NOTES FOR INVESTORS.

Latest quotations for copper are: Electrolytic, 16@16¼c.; Lake 16@16¼c.; casting, 15¾@16c.

The American Telephone and Telegraph Company has declared the regular quarterly dividend of 1½ per cent..

The Chicago Union Traction Company announces that its annual report will be made to the court, but will not be given to the stockholders or the public.

One of the disappointing features found in the recent annual report of the Philadelphia Rapid Transit Company is the small increase in the number of passengers carried.

A franchise tax of $1,000,000, levied by the State of Minnesota against the Western Union Telegraph Company, has been declared constitutional by the Minnesota Supreme Court.

The New York and Electric Commission has reserved its decision on the application of the St. Lawrence River Power Company of Massena to issue $1,500,000 twenty-year gold bonds bearing interest at 5 per cent.

The directors of the Electric Storage Battery Company have declared the usual quarterly dividends of 1½ per cent. on the common and preferred stocks, payable October 2 to stock of record September 28. The books do not close.

The American Railways Company, which controls a number of street railway companies in New Jersey, Pennsylvania, Ohio and Illinois, has issued its annual report, showing an increase of $1,058 in gross earnings and a decrease of $6,965 in the net.

The Westinghouse Electric & Manufacturing Company has declared the regular quarterly dividend of 2½ per cent. each on its preferred assenting and non-assenting stocks. payable October 10. Books close September 28 and reopen October 11.

A report from Cleveland says that the National Carbon Company has booked more than enough business to keep all its plants running day and night well into the next fiscal year. It is also added that evidence of the recently reported competition is as yet invisible.

The Newark & Hackensack River Railway Company and the Jersey City & Hackensack River Railway Company, both affiliated with the scheme to tunnel the Hudson River between New York and Jersey City, have been incorporated in New Jersey with an authorized capital of $1,000,000 each.

It is stated that one incentive for recent buying of New York Metropolitan stock was the published statement of arrangements for a connection by tunnel between the Metropolitan and the Public Service Corporation of New Jersey in connection with the incorporation of the Interstate Tunnel Company, to be financed by Metropolitan and Public Service interests.

The annual report of the Interborough Rapid Transit Company, which operates the Subway and the Manhattan Elevated lines in this city, was issued on Saturday last. According to the report a million passengers a day are carried by the Subway and elevated lines. The increase in gross earnings amounted to $2,649,685, while the net earnings gained $1,098,352. The increase in gross income amounts to $1,247,888, in net income, after deduction of fixed charges, to $494,195. Dividends paid during the year increased by $1,662,500 over those paid the year before, so that the surplus shows a decrease of $1,168,305. The passengers carried in 1904-5 increased in number 52,470,625 over those carried in 1903-4.

EDITORIAL NOTES.

The Street Railway Convention.

After six days' of wise legislation in Philadelphia the various street railway associations concluded their labors on Saturday afternoon. The parent body—the American Street Railway Association—agreed upon a form of organization and adopted a new constitution and bylaws. Permanent headquarters will be established in New York City and a secretary placed in charge who understands the technical part of the business.

The convention acted wisely in re-electing Hon. W. Caryl Ely president, as it was mainly due to his untiring efforts that the new plan of organization was pushed to the front at this time.

The "American Street and Interurban Association" is the name adopted by the new organization. We welcome it to New York City.

* * *

The Torch and the Electric Lamp.

Doctor Feuerbach, head of the largest lamp works in Europe, claims that the efficiency of incandescent lamps is only 1 per cent.; 99 per cent. of the electrical energy is dissipated in the form of heat. In other words, in spite of our remarkable progress in the design and construction of power-producing machinery, our light-giving devices are sadly deficient. This deficiency arises through the peculiar, though at present necessary process the energy is passed, by which light is to be produced. It also arises through the need of employing materials that stop at the critical point in yielding up their vibrations to serve our purposes. It seems so difficult for the laity to grasp the fundamental idea underlying all of these complicated and expensive light-making methods; the idea that the light sought for is only found at one end of a color scale, while the system of getting there, now in vogue, calls for an effort beginning where the scale begins, and passing through all the intermediate stages to the end required. The power producing the light is either transformed too frequently, or it does not deliver its millions of light-making impulses effectively.

The situation therefore is one that calls for more than passing comment. It enters into the fields of science, commerce, domestic economy and civic advancement. It is light which is needed now more than ever before. The old days, when those that could read used the firelight or the flickering rays of a torch, have fortunately passed. But it must be admitted that, though passed, the advancement from this illumination to the apparent triumph of employing electricity is more fancied than real. Throwing away 99 parts of a useful thing in order to use but one part cannot be consistently regarded as a sign of such remarkable progress. It is admitted that great advantages have been gained, but not to the extent that might have been inferred from the progress in other directions.

Yet better prospects have appeared in the form of a tantalum lamp; a lamp whose filament is made of tantalite. What is tantalite, and why is it so advantageous to use instead of carbon? "Tantalite occurs in nature in various minerals. There are two groups of tantalite ores—tantalite and columbite. The tantalite ores, found in Australia and Scandinavia, contain tantalite of iron and manganese. From these ores tantalite is first separated as tantalic acid, which is converted into a double fluoride of tantalite and potassium, from which tantalite is derived as a pure element. The real discoverer was Eckeberg in 1802, and another experimenter was Berzelius in 1824. Doctor von Bolton, of Germany, obtained pure tantalite after laborious experiments. It is a heavy mineral, with a gray metallic luster, resisting acids and alkalies. It has the hardness of steel and great tensile strength, and can be worked into thin sheets and fine wires. It melts only at an enormous temperature, somewhere around 4,000 degs. F., and becomes, through annealing, hard enough to withstand a diamond borer." According to reports of tests, this high temperature withstood by tantalite makes lamps employing it take one-half the current, and give twice the light of those using the same power with carbon. It lasts, too, from 100 to 400 hours, giving full candle power throughout. Costing, as is does, $5,000 a pound, may hinder its general usefulness, but it seems to exhibit qualities that place it in advance of all types of its kind extant. Let the art of lighting permit the critical point of temperature to be safely passed and the battle is won. Perhaps in tantalum lamps we may find a means of advancing far beyond the historic torch of our forbears.

* * *

Electric Railways.

The day is unquestionably coming when the principal railroads of the country will discard the steam locomotive and adopt electricity as motive power. As is generally known several railways in this vicinity are about to give the electric locomotive a trial over comparatively short stretches of track, and now we hear that the New York, New Haven & Hartford Railroad intends in the near future running electric trains from here to Boston by means of the single-phase alternating current system.

It is interesting in this connection to note that the subject of electrically operated railways was taken up and discussed by the British Association at its recent meeting in South Africa. There was no paper devoted expressly to this matter, but an interesting debate upon it followed upon a paper on the Cape Government Railways, contributed by Mr. A. M. Tippett, the chief resident engineer of that system. The electrical question was introduced by the chairman of the section, Mr. R. H. Hammersley Heenan, who mentioned it as the burning matter of the year, and Sir William Preece followed with various remarks, which went to show that electric railway traction was in a very tentative state both in England and America. He described the recent main line electrical work on the third rail principle at Liverpool and Newcastle as being representative of an obsolete system, and seemed to give his blessing to the single phase alternating current system with overhead conductors. He said that it would not be long—seeing the intention of the London, Brighton & South Coast Railways to equip a London suburban section on this principle—before there would be a splendid object lesson both of continuous and alternating railway working in London. Then English railway men and electrical engineers, too, would be able to compare the relative advantages. Many men seemed to think that the whole and sole question was the relative cost of working the line by electricity as against steam. But, said Sir William, it was rather the advantage that the current would have in expediting the rate at which they could get on their speed and maintain it in working their line.

Mr. Robert Hammond followed with remarks couched in a similar vein, illustrating the benefits accruing from higher accelerating power, and he ended quite characteristically when he said he trusted that next time the British Association went to South Africa they would find that something had been done in regard to railway electrification.

UNDER THE SEARCHLIGHT.

Notes and Comments on Various Topics.

A cable dispatch says that a lockout in three of the greatest electrical companies in Berlin began last Saturday afternoon. It affects all the factories of the Allgemeine, the Siemens & Halske and the Siemens-Schuckert companies except one lamp factory, and throws 33,000 workmen out of employment.

The Electrical Section of the Western Society of Engineers will hold its first meeting of the season on Friday evening, October 13, in the Society's rooms in the Monadnock Block, Chicago. A paper will be presented by Mr. James R. Cravath on "Do We Need Better Illuminating Engineering?"

A French contemporary describes an electrically operated railway for the transmission of mail and packages. Trials have been made on a circular track of 1,640 feet radius. The car used is 28.8 feet long by 3½ feet wide, and weighs 6¾ tons. The speed aimed at is 156 miles an hour, and this has been readily attained on trial. The car runs upon a single rail, but is guided by guide-wheels bearing on opposite sides of a special guide-rail. There are two driving wheels driven by belting from three-phase motors taking current at 1,000 volts and at a periodicity of 40 cycles per second. It has been found that the speed of 156 miles an hour was attained in five minutes from starting, and on the current being cut off the vehicle came to rest again after the same lapse of time. The retardation on cutting off the current can, however, be greatly increased by means of wind resistances, which are folded down flat on the car when it is running, but are opened out automatically when a certain string is cut by a fixed knife interposed in the path of the car.

An exchange says it is to be noted that Mayor Dunne of Chicago is still bumping the bumps on the rocky road to municipal ownership.

Of what young men think of electrical work as a profession there is a suggestion in the preferences of the students at the Brooklyn Evening Trade School. Of 1,070 students 226 have chosen electrical engineering and 102 electrical wiring as against 16 who selected blacksmithing, 50 tinsmithing and 30 pattern-making.

The Polytechnic Association, a section of the American Institute of Electrical Engineers, will discuss "Trade Marks" at its meeting in the Institute Hall, 19-21 West 44th street, this city, Thursday evening, October 5.

The Rowland Telegraphic Company will exhibit a quadruplex apparatus at the Milan Exposition of 1906, probably under the auspices of the Italian Government. The project of an entire change in the operation of the Italian telegraphs, based upon the introduction of the Rowland system, is now actively before the Italian Parliament.

An unusual feat in wireless telegraphy was accomplished last week in the transmission of an aerogram from the station at Newport, R. I., to the Washington Navy Yard, a distance of 320 miles. Owing to the fact that the waves traveled over both land and sea, the incident has attracted more than ordinary interest at the Navy Department.

President Ely of the American Street Railway Association says it is only a question of a very short time when the trolley roads will become very strong competitors of the steam lines for the local freight carrying business as well as local passenger traffic.

A NEW REFLECTING LANTERN.

BY A. FREDERICK COLLINS.

Those who have magic lanterns or stereopticons very often would like to project some object or print upon the screen, but to do this would mean the making of a photographic reproduction on glass, and usually this procedure is impracticable either for want of time or because it would be too expensive.

Many years ago some genius invented a miniature reflecting lantern for showing opaque objects, and he called it the "polyopticon," but this little toy did not meet with any great success, for the reason that the picture so thrown upon the screen was not nearly bright enough, large enough, nor was it at all clearly defined.

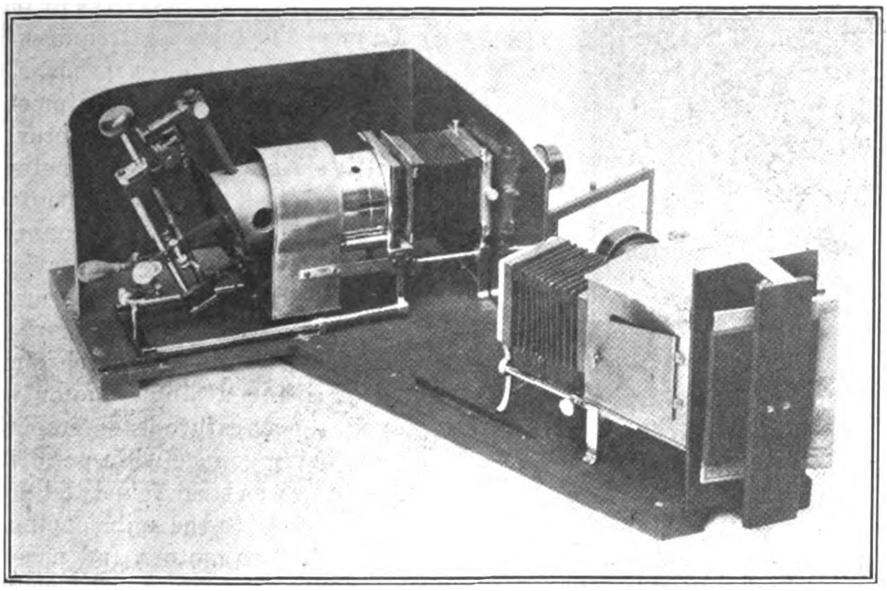

Fig. 1.—View of Reflecting Lantern Arranged for Showing Lantern Slides.

However, this plaything embodied the right principles, and its failure as a scientific instrument at the time it was brought out can easily be traced to defective lenses and poor light, for the art of luminous projection by electricity had at that period not been developed even for stereopticons, the lime light being the brightest source of illuminating power then available.

Since the introduction of the polyopticon there have been many improvements made tending to adopt it to practical purposes, and this evolutionary progress has resulted in the instrument shown in the illustrations.

The great improvement in the new reflecting lantern is primarily the source of light and by means of a dispersing lens the light is as evenly distributed and the screen as brightly illuminated as though the light was refracted through a slide instead of reflected from an opaque object. The complete apparatus comprises a regular projecting lantern for showing the usual glass slides, and to this is fitted a 90 degree hand feed electric arc lamp. This projector and the reflecting lantern attachment are mounted on an interchangeable base, so that lantern shows or ordinary pictures can be shown as desired, the change being made almost instantly.

Fig. 1 shows the projecting lantern adjusted for using ordinary glass slides and Fig. 2, after the change has taken place, the bellows of the first being connected to the bellows of the reflecting lantern with the dispersion lens being placed between them. In Fig 2, the arc lamp is represented by 1, the projecting lens at 2, the dispersion lens, referred to above at 3, the reflecting chamber at 4, where the angle of the rays of the arc light are changed from the print or object in the holder 5, through the objective lens 6, where it is again made to change its angle of incidence by the mirror 7, whence it is projected upon the screen as shown in Figs. 3 and 4.

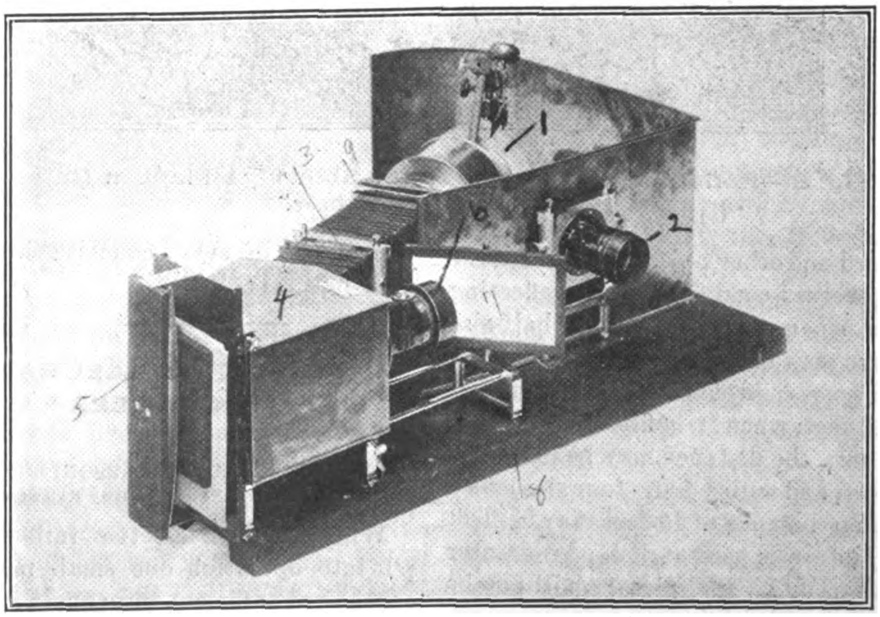

Fig. 2—View of Reflecting Lantern Arranged for Showing Reflected Pictures

The object holder 5 is an ingenious contrivance that has done much to popularize this form of lantern. This device is arranged so that it may be attached or detached instantly and yet its size has really nothing to do with the metal body of the lantern to which it is fastened. That is to say, the holder is adjustable within wide limits and an open book of ordinary size may be held so that any of the pictures on any portion of the page may be thrown upon the screen without the slightest injury to the volume, or the smallest card or cut may be held just as securely.

The value of a flexible object holder of this description can only be appreciated by those who have had to contend with those formerly on the market, and which generally consisted of a hinged door equipped with a set of spring clips to hold the picture, which if too large had to be cut to make it fit, and as it is frequently desirable to show pictures and designs in books, the scheme was quite impracticable. Another strenuous objection to reflecting lanterns of the past, and which in the present one is entirely obviated, is that the edges of the picture projected on the screen would show and tend to be confusing, especially in cases where they were blurred. In the instrument under consideration this untoward feature is overcome by the very simple expedient of using a diaphragm at 9, which represents the slide chamber of the ordinary lantern, and by this means all the light from the edge of the picture is cut out, forming a clean-cut block frame. Another interesting improvement is found in the method by which the operator is given absolute control over both the size and finish of the picture; this is accomplished by the lens at 3, and by moving this forth and back an adjustment may be obtained so that any picture from one to five inches square, may be used.

The object of the mirror 7 is to cause the picture when reproduced on the screen to assume its natural position, or otherwise printed matter would read backward and other objects would appear in a reversed condition. The reflecting lantern when supplied with a half-size objective can be used at any distance from the screen providing it is not greater than 20 feet; when it is fitted with a two-thirds size, the distance may be increased to 30 feet, and with a four- four size lens a maximum distance of 40 feet may be had. If the lantern is used at distances greater than those cited, the picture will not be as brightly illuminated, as its size rapidly increases.

The sheet iron shield, shown at the side and front of the lantern body, is arranged to keep rays of light from the lamp from reaching the screen or the audience. To get the best results with the reflecting lantern, the arc lamp should be fed with a current of from 20 to 25 amperes, and to obtain the right amount of current an adjustable rheostat is furnished. The instrument is not at all expensive considering its vast utility, and can be purchased for less than $50, where the reflecting attachment only is needed, but where a projecting lantern must be had the price is approximately double this amount. With the combination, however, the lecturer has at his command means for projecting images, magnified many fold, and objects of every conceivable kind in their natural colors.

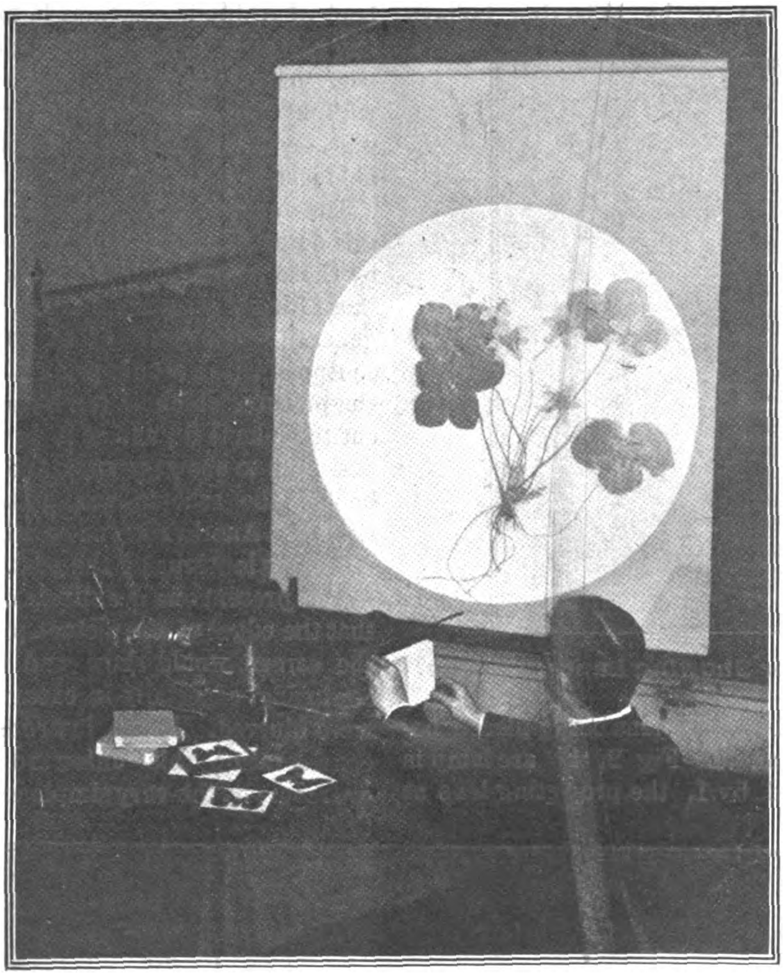

Fig. 3.—Reflecting Lantern Used for Showing a Plant in Natural Colors on the Screen.

THE SERIES-PARALLEL RAILWAY CONTROLLER.*

BY W. A. PEARSON,
Electrical Engineer New York City Railway Company.

When the first electric railways were put into operation one small motor was considered sufficient to propel a car.

On some of these early equipments in which shunt motors were used, the brushes were designed to be moved around the commutator for the purpose of reversing the direction of rotation, it being considered impossible to provide the same neutral commutating points for both directions.

In developing the series motor it was found that common neutral points for both directions of rotation could be produced, permitting the use of a double pole, double throw switch for reversing the connections of the armature leads.

The simplest way to start and control the speed of the single motor was to use a dead resistance in series with it. This method, which was adopted, has been successfully used for single motor equipments since the earliest days of the art.

To meet the increased requirements of heavier cars and higher speeds, a second motor was added to the equipment. As the rheostatic control had proved sufficiently satisfactory for one motor equipment, it was also considered suitable for two motors permanently connected in parallel. Consequently a heavier rheostat was used with two motors connected in this manner.

At first a reversing switch similar to that used for a single motor was employed, the armature leads from the two motors being connected in parallel. This connection was soon found to be impracticable owing to the unbalancing of the load on the two motors, and necessitated the use of separate reversing switches.

In order to obtain an efficient running speed at somewhat less than the full speed of the motor, several methods of varying the field strength were tried with different degrees of success. Some motors were provided with field taps, or "loops," the full field being intended for use in starting and ascending heavy grades.

The field strength was weakened by cutting out a portion of the winding by means of the tap, thereby allowing more current to pass through the armature, increasing accordingly the speed of the motor. Another method consisted in connecting sections of the field coils, first in series and then in parallel, to produce different field strengths. These two methods were used for a few years, and finally abandoned owing to troubles resulting from the burning out of field coils. In the next field variation method that was used, a resistance was placed in shunt around the fields of each motor, thereby accomplishing the same result but in a somewhat different manner. This also led to complications, as motors were operated under such varying conditions. In some cases the full field point was used excessively by the motorman, the coils becoming overheated, and in other cases the shunt point was used too much on heavy grades, resulting in armature and commutator troubles.

---

*Paper read at the annual convention of the American Railway and Mechanical Association, held at Philadelphia, Pa., September 25-26, 1905.

Field variation for obtaining speed control was abandoned by the manufacturers of railway motors about nine years ago, and since that time but two speeds have been provided without series resistance in controllers supplied with two motor equipments.

About fourteen years ago the attention and energies of manufacturers of railway apparatus were applied to the development of a control for two motors which, when starting or running slowly, would waste less power than the rheostat and would permit running efficiently at half speed.

The method which seemed to promise the best result was to start the motors in series, and after they had reached their full speed for this position, reconnect them in parallel. Many different experimental controllers were constructed in the attempt to produce a satisfactory piece of apparatus.

Nearly all original electrical apparatus was crude as viewed from our present standpoint, to which view these early series-parallel controllers formed no exception.

One of the forms was fan-shaped with a stationary slate board to which were secured the motor, resistance and other contacts, with a movable arm, pivoted at its lower end, and adapted to move from side to side of the slate board, thereby making the necessary circuit combinations. This form was defective for two reasons. The circuits made were not suitable for giving proper speed variations and no adequate means were provided for breaking the arcs formed at the contacts. Several different manufacturers attempted to design controllers of this shape, both for single motors and two motors, but without success.

A more successful series-parallel controller was brought out in 1892, which was located beneath the car and operated by means of rods and bevel gears from either platform. This controller was used in conjunction with the same reverse switch as was used with the rheostatic control. It was expected to fill the great want, but after several hundred had been put into service it was found that improvements were necessary. The starting of the car with this form of controller was jerky, as an insufficient number of points had been provided, while the impossibility of properly installing the controller under the car, so that lost motion in the gears would not be excessive, produced serious burning at the contacts.

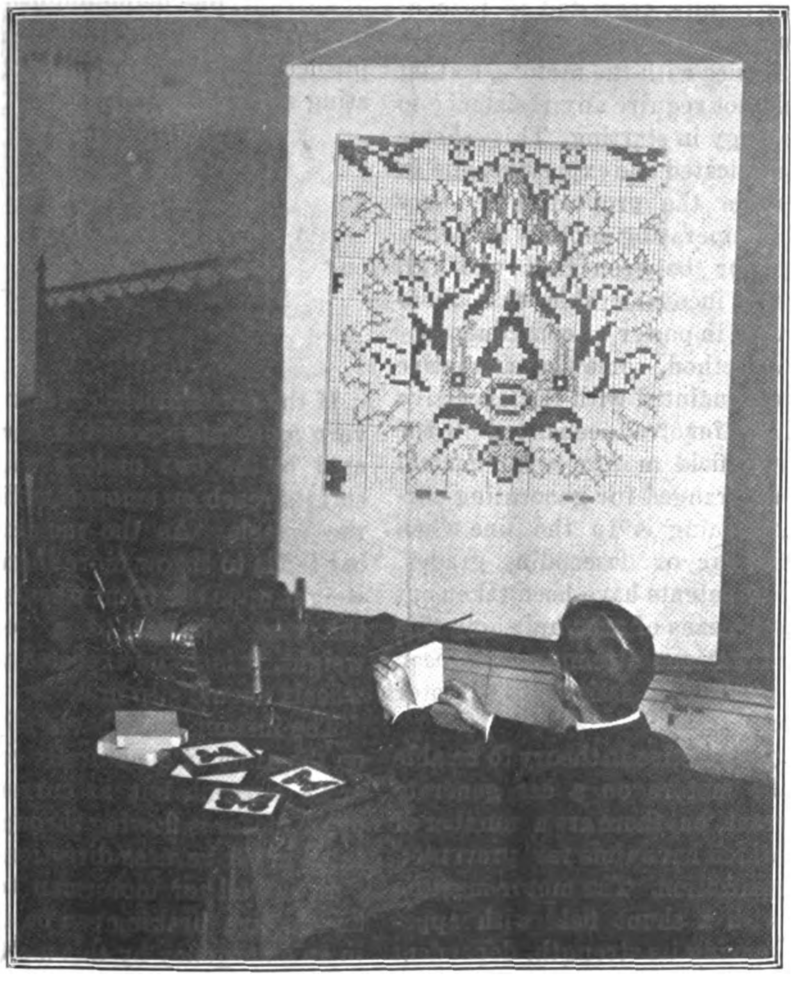

Fig. 4.—Reflecting Lantern Used for Showing a Textile Design Upon the Screen, the original being mounted on a plain card.

This controller contained a magnetic blowout for disrupting arcs, which was very much superior to anything made previously and which served its purpose in proving the value of the magnetic blowout. It was also the first controller which shunted one motor in passing from series to parallel.

At about the same time another form of series-parallel controller was brought out by another manufacturer, in which a cylinder was used in conjunction with stationary contacts, or fingers, for producing the different resistance and motor combinations. As it was installed on the car platform it did not require operating mechanisms and was in consequence simpler in construction and not liable to the troubles due to lost motions in transmitting the turning effort from the operating handle. This controller also met with partial success, although the arcing at contacts was considerable, which, in the absence of the magnetic blowout, caused the principal trouble.

These two forms of controllers clearly demonstrated the practicability of series-parallel control, and demonstrated that the magnetic blowout to take care of arcing, and the cylinder for compactness and simplicity, were necessities in the design of a controller for operating two motors of the capacity about 30 hp., then used.

The final outcome of the series-parallel controller for street car service was the present well-known K type, which has been practically standard for about 12 years.

This controller owes its success very largely to the form of magnetic blowout employed for extinguishing the arcs formed in opening the circuits and the method of making the transition from series to parallel.

Other forms of magnetic blowouts differing in detail have since been designed which have operated satisfactorily, but the form used in the K type of controllers was the first to be made commercially successful.

In this type of controller, after the motors have reached the full series position, a portion of the starting resistance is quickly reinserted in the circuit and a shunt is put around the No. 2 motor by connecting E^1 to ground, thereby eliminating that motor from the circuit, as shown in Fig. 1.

Immediately after this circuit has been established the connection between No. 1 and No. 2 motors is broken, and the positive lead to armature of No. 2 motor is connected to the rheostat, while the line current then passes to No. 2 motor and the motors are in parallel, as shown in Fig. 2.

In the L type of series-parallel controllers, instead of maintaining the current through one motor during the transition, the circuits of both motors are broken. This method of passing from series to parallel was adopted in railway controllers for motors of a total of over 250 hp. It was found that the arcing in the controller when using the K type of connections was too great to permit their use in large controllers.

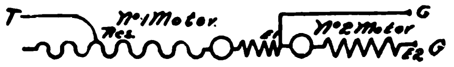

Fig. 1.

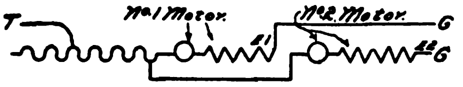

Fig. 2.

In the development of multiple unit control it was found that a better method of making the change from series to parallel, which had been proposed before the first K type of controller was made, was possible with separately actuated switches or contactors. This is what is known as the "bridge method," and consists in keeping the current on both motors during the transition. Each motor is provided with a separate resistance, and when full series has been reached the connections are as shown in Fig. 3.

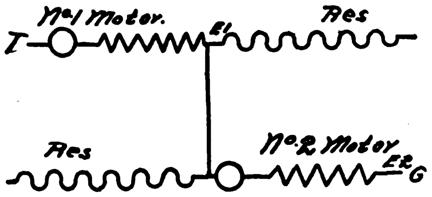

Fig. 3.

When passing from series to parallel the first transition step is with resistance for No. 1 motor connected to ground, and resistance for No. 2 motor connected to trolley, as shown in Fig. 4.

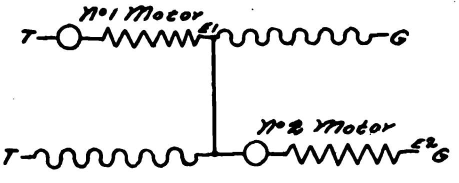

Fig. 4.

It will be seen that this last step has put the two motors in multiple with an equalizing connection between E^1 and the positive side of the armature of No. 2 motor. This equalizer is next open circuited, and the motors are in the first parallel position.

This method of making the series to parallel change permits a somewhat smoother acceleration than with the K type of connections, but it is not essential for light equipments where great smoothness is not such an important consideration as on heavy cars operating with multiple unit control.

Several attempts have been made to produce a control which would be still more economical in use of power than the series-parallel method now in use.

One of these, on which a considerable amount of ingenuity has been expended by different inventors without producing satisfactory results, consisted in providing a "counter electromotive force generator" in series with the motors, so that they should not require any resistance to consume energy in starting. This scheme proved complicated and expensive, and in actual service the proportionate time consumed in operating motors at below half speed, or between half and full speed, was so inconsiderable that there was no saving in power of consequence.

Another method, somewhat attractive to those unacquainted with the excessive complications involved, consisted in the use of shunt field motors with control connections arranged for generating current and returning it to the line when stopping the car or descending grades. A number of patents have been taken out for different means of accomplishing this result, and various attempts have been made to produce a satisfactory motor and control.

It is very attractive in theory to be able to make the motors on a car generate useful current, but there are a number of obstacles which have thus far prevented practical realization. The motor must be provided with a shunt field with apparatus for varying its strength, dependent upon the speed while braking, and apparatus must also be provided for giving practically a straight series field for starting.

In addition it is necessary to connect the armatures in parallel and series relation for braking, according to the speed of the car. When the armatures are in series, and the field strength is at a maximum, the minimum car speed at which current at line potential may be generated is obtained. It is obvious that when the car is moving at a speed less than this critical speed, the motors will be taking current from the line instead of furnishing it.

On a K-10 controller or similar two-motor equipment, it is a well-known fact that in an emergency the car may be stopped when the trolley is off, or main fuse blown, by throwing the reversing handle to its backward position and turning the controlling handle around to multiple. The connections made are such that the two motors are really connected in series, as shown in Fig. 5, but in such a manner that the voltages of the two armatures oppose each other. If these voltages were exactly the same there would be no flow of current, and consequently no braking. As a matter of fact no two motors are identical, and the slight difference in initial voltage gives one motor predominance over the other and determines the direction of the flow of current, one being obliged to reverse its polarity. This can be readily accomplished as the changing motor is operating as a series generator.

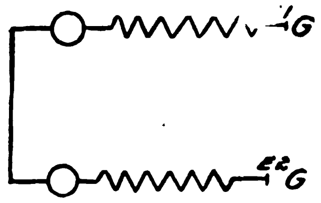

Fig. 5.

If the car is moving at any more than a very moderate speed the current generated by the two motors will almost instantly reach an amount sufficient to slip the wheels. As the momentum of the car tends to throw more than the normal weight upon the front wheels, and relieve the rear wheels of a corresponding weight, it is to be expected that the rear wheels should slip first.

The instant the wheels slip the motor on the same axle naturally ceases to generate current, but as current from the other motor is flowing through it, it is rotated in the reverse direction as a motor.

It is well for motormen to know that an effective braking can be accomplished in an emergency by this method.

On four motor equipments where two motors are connected in multiple, it is only necessary to throw the reverse handle to cause the motors to generate, as the circuits are already made, and it is only necessary to reverse the relation of armature and fields.

With a four-motor equipment, care should be taken that the car is brought to rest before the reversing handle is returned to its forward position, otherwise the contacts are liable to be burned. A recent controller, known as the K-28, has been provided with extra air space in the vicinity of the reversing contacts, while barriers are located between them, so that the chance of injuring the reversing switch when "bucking" the motors has been removed.

When motors have been used with electric brakes the controller made connections somewhat different from the foregoing, as it was necessary to vary the quantity of current taken and divide the load equally. Fig. 6 shows the connections.

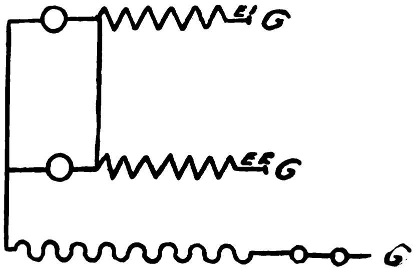

Fig. 6.

Electric brakes have not proved very satisfactory, principally for the reason that their action was too irregular, and they could not always be depended upon. In order to generate current satisfactorily it was essential that the commutator should be in good condition. A comparatively slight increase in the resistance of the circuit caused by a dirty commutator or loose connection would prevent a motor from building up at a certain speed.

Due to this irregular action in the motor it was sometimes difficult to make a smooth stop with electric brakes.

It was also found that the high voltage and additional duty imposed upon the motor was productive of commutator trouble and overheating.

The duty required of a street car controller has gradually increased. Instead of two 30 hp. motors as formerly, four larger motors are now controlled in the same space. Voltages have been increased and the capacity of the line also raised, so that when an extraordinary arc occurs in a controller from any cause the damage is greater than formerly.

For this reason it is especially necessary to keep fingers properly adjusted, segments renewed and connections tightened to avoid troubles on the road.

There is a growing tendency to place controlling apparatus for large and medium size motors under the car. It removes the heavy capacity parts from the platforms and not only leaves a greater passenger space but also eliminates all possibility of danger from controller "blow ups."

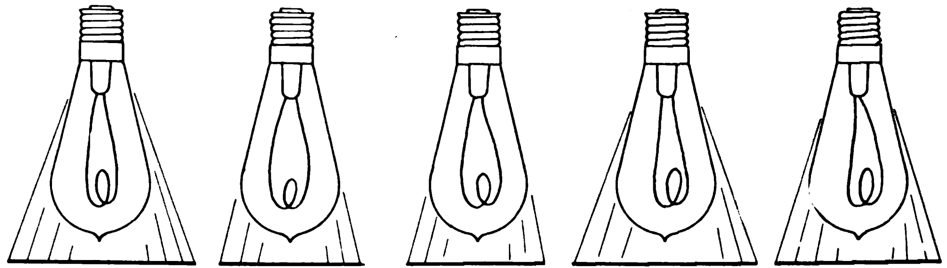
Wireless on Moving Trains.

Wireless telegraphy on moving trains has been demonstrated to be practical, according to a report of Consul-General Guenther, of Frankfort, Germany, to the Department of Commerce and Labor at Washington. Trains equipped with wireless telegraphy on the Zossen-Berlin military road for the last two years have been able to communicate at all times with telegraph stations along the line, and to report instantaneously any irregularities or accidents. The aerograms are likewise sent from stations to moving trains.

LIGHT, HEAT AND POWER PRINCIPLES.—II.

BY NEWTON HARRISON, E. E.

Selection of Lamps.—The distinction to be drawn between one form of lighting and another is largely determined by the character of the illumination in view. From a broad standpoint, the difference is that of interior from exterior lighting. The lighting of office buildings, theaters, large halls and private dwellings, differs in the nature of the lamp required, when compared with the street. In the first case, many small centers of illumination become the means by which a comparatively uniform degree of lighting is secured. In the second case, more intense centers of illumination are the foundation for an outside system, by which the streets of a city are lit up over a series of contiguous areas. In the majority of cases where lighting is done the light is so developed that it falls directly upon the areas to be brightened. The light is not, as a rule, cast upon a given surface and then reflected downwards or sideways. It is the object of lamp manufacturers to avoid, as far as possible, the dispersion of light, or its undue absorption through an inefficient and unscientific method of distribution. Although globes of all shades and colors are brought into commission, their use is only necessary because of the disagreeable intensity of the light, and the desirability of shading or toning it down. Different colors are effective, from an æsthetic standpoint, in the production of pleasing hues; but any method which affects the color also diminishes the light. Ground glass, as well as opalescent shades or globes, are very wasteful in this respect. The resulting condition of affairs in the lighting field is somewhat illogical, for the reason that knowledge and skill are brought into play to develop a highly efficient generating, transmitting and distributing system, with regard to the electrical energy involved; and this, when transformed as far as possible into light, is permitted to pass through globes and screens, by which from 10 to 40 per cent. or over is wasted. Meter measurements, indicating excellent judgment in the method of generating electricity, when contrasted, in some instances, with the returns obtained from candle power measurements, seem to show light losses of a serious nature. A given amount of power is productive, with modern lamps, of a given amount of light. In other words, a certain weight of kerosene oil, from which a horse power could be obtained, if exploded in a gas engine; a certain number of cubic feet of illuminating gas similarly utilized; a given weight of coal burnt in a steam boiler, or oil used as fuel for the same purpose; a horse power of mechanical energy obtained from a water fall; all of these are sources of power which, with respect to lighting, produce a certain amount of candle power. Power therefore represents light when so transformed; and it merely becomes a question of the means or mechanism employed, as to whether the tranformation results in much or less light. Using screens or shades, however, which absorb a heavy percentage of the light, is equivalent to using defective machinery in the way of inefficient boilers, engines, dynamos or conductors, causing too heavy a line loss.



Light Wasted with Different Screens.

Returns from Generators.—Generators of different horse power vary with respect to the returns they give when set into operation. A 1 hp. dynamo is necessarily less efficient than a thousand horse machine. The percentages of efficiency increasing, with the capacity of the generator, is to have been expected, as shown by the following table:

Power of generator in kilowatts.	Percentage of efficiency.
1	60 to 70
5	70 to 80
10	80 to 90
15	85 to 90
20	87

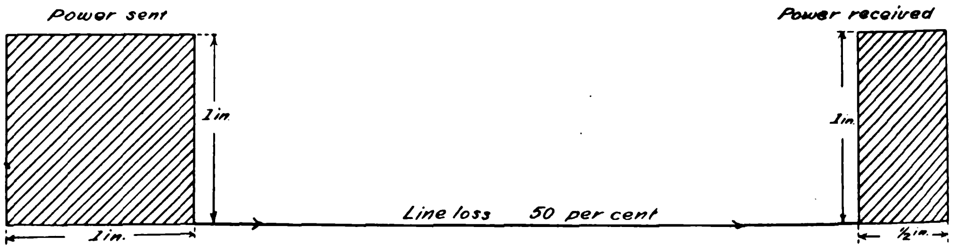
Power of generator in kilowatts.	Percentage of efficiency.
25	89
30	90
40	91
50	92
60	92.5
80	92.5
100	93.0
150	93
200	93.5
300	94
400	94.5
500	95 to 96
1,000	96 to 97

Cost of High Efficiency.—One of the best rules followed by conservative engineers is that of not reaching out for a too expensive efficiency. By this is meant, the efforts made to overtop the market or commercial efficiencies a few per cent., at a cost all out of proportion to the benefits gained. As an example of this false economy, suppose a generator costs $1,000 and possesses an efficiency of 90 per cent. If it costs the manufacturer an extra $200 to gain this few per cent. more, then whatever economic advantages supposed to arise from the few per cent. additional efficiency are lost through the following: First, the additional investment and the interest it represents; second, the additional difficulty of making sales through the higher price; third, the necessity for special attention to preserve the advantages paid for; and fourth, the inability to control losses in light through its faulty manipulation when developed. For these and perhaps additional minor reasons, the cost of high efficiency is sufficiently prohibitive, when obtained by too heavy an additional investment, to be a practical commercial proposition. The durability and amount of care required to give uniformly good returns are the governing influences in the selection of dynamos and motors. For equal investments, the machine of the most solid construction is by far the better choice.

Elements of Power.—The method of calculating electric power is based upon the pressure in volts and the current in amperes. These are the elements of power for either direct or alternating currents. In the case of a direct or continuous current, both the volts and amperes operate as elements of power simultaneously. In the case of an alternating current, the volts and amperes may not operate simultaneously as elements of power. For this reason, in the latter case, the amount of power is calculated with reference to that condition or conditions which prevent the co-operation of the pressure and current at the same time.

Continuous Current Calculations.—For measuring the pressure in volts or the current in amperes both volt and ampere meters are employed. These instruments are so devised that the current passing through produces a magnetic field. The extent to which this field is manifested is, in a general way, the measure of the number of volts or amperes in the circuit.

For instance, in a voltmeter of the standard Weston make, more volts or less volts produce through its fixed resistance more or less current; which produces a stronger or weaker field; a stronger or weaker mechanical pull against a coiled spring; and in consequence a greater or less range of indication of the pointer showing the volts in the circuit. In the same manner an ammeter permits the current to operate similarly. Instead of the current passing through a low resistance in the voltmeter, the resistance is made as high as possible. By this means the voltmeter takes only sufficient current to actuate its mechanism. The resistance of a 150 volt reading meter of the Weston construction, ranges from 10,000 to 20,000 ohms. The amount of current abstracted from the source being measured, is thus reduced to a very low figure; sufficiently low, to make no impression upon the records given by the ammeter, when both instruments are in operation simultaneously on the circuit. The ammeter is constructed with just the opposite idea in view. Its resistance is made as low as possible, so that when current measurements are taken, its resistance is not the cause of drop in the instrument. For this reason the resistance of an ammeter will be as low as a few ten thousandths of an ohm. In one instrument as little current as possible is consumed, in the other, as little of the voltage as possible is dissipated.



Sketch Showing Power Lost in Line.

Power is measured in watts, or in quantities of a thousand watts at a time, called kilowatts. Watts are obtained by the product of volts and amperes. Taking a specific case, supposing 1,000 volts and 50 amperes are impressed upon a line of 10 ohms resistance. The power in watts and kilowatts, the drop, the watts wasted in heat, and the percentage of efficiency in the line as a conductor will be as follows:

Total power impressed upon the line = 1,000 × 50 = 50,000 watts.

Total power impressed upon the line = 50,000 ÷ 1,000 = 50 kilowatts.

Total volts wasted in the line = 50 × 10 = 500 volts.

Total power delivered at the other end = 500 × 50 = 25,000 watts.

Total power delivered at the other end = 25 kilowatts.

Total power wasted as heat in the line = 50 × 50 × 10 = 25,000 watts.

Total power wasted as heat in the line = 25 kilowatts.

Total efficiency of the line = 25,000 ÷ 50,000, or 50 per cent.

Sources of Power.—A variety of sources of power exist, which may be variously classified for convenience. These sources of power may be natural, as those supplied by the earth, water or air, or they may be artificial, that is, produced by mechanism and fuels of different character. As regards the natural sources of power they may be arranged in the following manner:

I.—SOURCES OF NATURAL POWER USED BY MEANS OF MACHINES ADAPTED TO THEM.

Air as utilized by means of wind mills for developing rotation.

Water (falling) as utilized by means of water wheels for developing rotation.

Waves as utilized by means of pumps for developing rotation.

Tide (if fast) as utilized by means of water wheels for developing rotation.

Tide (if slow) as utilized by means of floats for developing rotation.

Sun's heat as utilized by means of mirrors and steam engine.

II.—SOURCES OF ARTIFICIAL POWER USED BY MEANS OF MACHINES ADAPTED TO THEM.

Coal as utilized by means of steam engines, steam turbines and rotary engines.

Gas as utilized by means of gas engines.

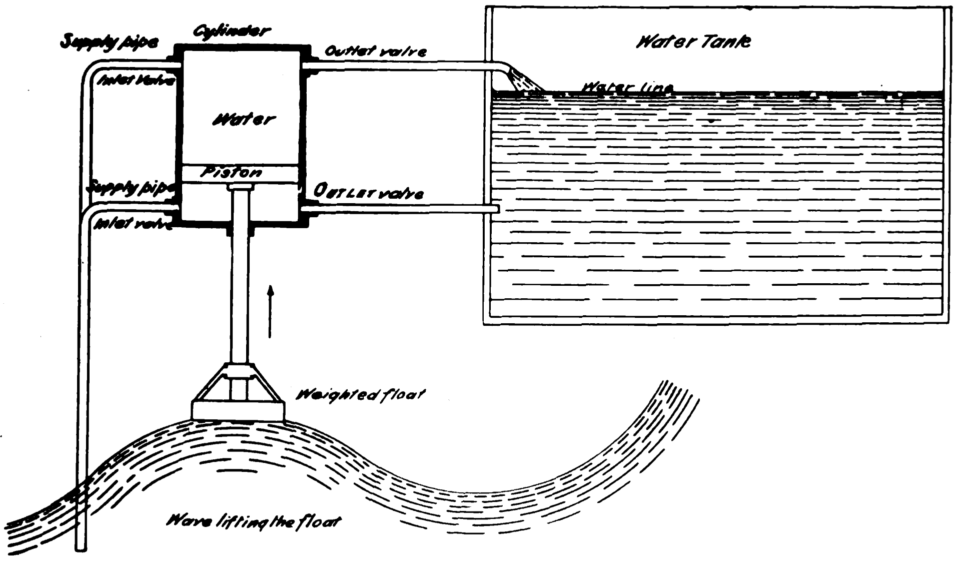
Oil as utilized by means of gas engines, or for producing steam.

Wood as utilized by means of steam engines.

Alcohol as utilized by means of engine specially constructed.

Compressed air as utilized by means of engine specially constructed.

As may be readily noted, this classification is more or less arbitrary, because of the difficulty of separating the purely natural from the artificial sources of power. But the line of distinction is somewhat strongly drawn, by the fact that in the first case no heat is directly or indirectly applied by man; while under the second heading, heat or an explosive spark, or both, is produced, either at the beginning or end of the process. The use of wind mills and water wheels may be found throughout European countries as one of the first acknowledged sources of natural power; the first, in fact, to displace manual labor or that of animals. In Holland particularly, wind has served this purpose from time immemorial. In Switzerland, water power, came into frequent employment, the source being the mountain torrents formed by the melting of ice masses or prehistoric glaciers.



Principle of a Pumping Wave Motor.

In the neighborhood of the Jersey coast, experiments have been conducted with wave motors built upon unique lines. The oscillating and up and down movement of the waves is employed to operate a series of small pumps. These pumps force water into a huge tank against considerable air pressure. The water thus pumped in is under such pressure that when permitted to escape, it is capable of operating a water wheel or turbine in the same manner as a stream falling from a height productive of the same impact. The quantity of power obtainable on this basis makes it a proposition of great interest. The erection of strong steel supports, and other means of resisting the violence of the sea, constitutes an item of expense that merits conservative consideration. A few figures in connection with wave power will be of interest.

Power from Waves.—A cubic foot of water weighs 62.5 pounds. If it is lifted 5 feet and then permitted to fall, each operation will call for a manifestation of mechanical power equal to 5 × 62.5 = 312.5 foot lbs. The total energy is equal to 2 × 312.5 = 625 foot lbs. A wave rising and falling once every one, two or five seconds, would rise and fall 60, 30 or 12 times a minute. With these figures as a foundation, the foot lbs. developed are equal to 60 × 625, 30 × 625, or 12 × 325; equal respectively to 37,500, 18,750 and 3,900 foot lbs. per minute. As there are 33,000 foot lbs. per minute to a horse power, these cases represent conditions productive of more than 1 hp. $\frac{1}{2}$ hp. and $\frac{1}{10}$ hp. In a vertically situated pump, whose piston rod is weighted to keep the piston down until lifted by the advancing wave, a series of reciprocations will be possible, the power of which can be readily estimated. The wave must lift the piston rod in this case, through the medium of a buoyant mass attached to it, yet sufficiently heavy to drop downward when relieved of the force of the wave. Along a hundred feet of shore line, devices of this kind properly arranged would easily operate, and pump water into the receiving reservoir at all times. It is a matter of simple calculation to see how large a source of power can be derived from a system of this character. It would not be too far fetched a statement to make, to say that along the Atlantic coast, millions of available horse power in this form could be turned to a useful purpose.

◆

The Great Berlin Street Railway Company has increased its capital $15,000,000 and will construct subways under several important streets of Berlin, Germany.

WRINKLES.*

EDITED BY H. C. ABELL.

An Improved Voltmeter Multiplier.

An occasion came up some time ago to measure a 370-volt circuit; no voltmeter of sufficient capacity was at hand. A 150-volt voltmeter was connected in series with the resistance box of a Wheatstone bridge, and plugs were pulled out until the resistance was twice that of the voltmeter, the voltmeter thus indicating one-third the applied voltage. These standard resistance boxes are wound non-inductively, and can be used in connection with either direct or alternating currents. It has also been used to increase the range of indicating wattmeters and is very handy, since any degree of multiplication can be obtained.

J. F. Dostal, Denver, Col.

Testing Armatures for Open-Circuit Coils in Thomson Recording Wattmeter.

Use an incandescent lamp of approximately 16 candle power and 110 volts alternating current in series with a relay, and these in series with the coil being tested. If the circuit is complete the vibrations of the armature will indicate it. Saving in time and increased facility in making this test are considerable when a number of meters are in the repair department. This may be practiced by some companies, but I know it is not universally applied.

Wilmington City Electric Company.

Testing Direct Current Meters by Use of Electroplating Dynamo.

In testing direct current meters on various loads we have found it very satisfactory to use an electroplating dynamo, with capacity of 150 amperes and 5 volts. The terminals of this dynamo are short-circuited through the series coils of the meter, and a resistance in the shunt winding of the field governs the load. One side of the regular line is connected to one terminal of the dynamo, and the other is connected to the regular shunt connection on the meter, thus giving the required voltage across the shunt on the meter. The electroplating dynamo is run by a single-phase induction motor. By this method we are able to get any desired load up to 200 amperes by taking comparatively little load off the line.

Thomas S. Richardson,
Denver, Col.

*Paper presented before the National Electric Light Association at its 28th convention, held at Denver-Colorado Springs, Col., June 6-11 1905.

PROCEEDINGS OF THE STREET RAILWAY CONVENTION.

The street railway men have good reason to be proud of their work at Philadelphia last week. The large attendance proved that all were interested in the reorganization scheme, and that in future there will be no "divisions in the ranks."

From the beginning of the week's programme there were no idle moments, as the papers presented by the various associations and the thorough manner in which they were discussed proved too attractive to the members to indulge in the many pleasures to be found on all sides.

The meeting of the American Mechanical and Railway Association extended over Monday and Tuesday. The delegates were welcomed by Mayor Weaver, who extended the freedom of the city, after which President Baker delivered his address, which was replete with good suggestions.

Papers were read as follows: "Power Distribution," by Mr. C. H. Hill; "The Power Station Load Factor as a Factor in the Cost of Power," by Mr. L. P. Crecellius; "Rail Joints," by Mr. F. G. Simmons; "The Power House," by Mr. Fred N. Bushnell, and "The Track Brake," by Mr. F. F. Bodler.

A long discussion followed the reading of each paper.

The following officers were unanimously elected:

President—H. H. Adams, Baltimore, Md.

First Vice-President—F. G. Simmons, Milwaukee, Wis.

Second Vice-President—J. S. Doyle, New York.

Third Vice-President—Paul Winsor, Boston, Mass.

Secretary and Treasurer—S. W. Mower, Detroit, Mich.

Executive Committee—W. S. Twining, Philadelphia; Fred N. Bushnell, Providence, R. I.; W. Boardman Read, New York, and A. D. Campbell, Seattle, Wash.

President Baker expressed, in a few well-chosen words, his thanks to the members for their co-operation during the term of his administration, after which the convention adjourned.

The American Street Railway Association.

Hon. W. Caryl Ely, president of the American Street Railway Association, called the 24th annual meeting to order at 11:15 last Wednesday morning.

In his address the president recounted the efforts that were made for reorganization, and spoke at length on the various questions that came up during the year in street railway circles, and the rapid advance in the electric railway art. He called the attention of the members to the agitation in favor of municipal ownership, "in order to attract their attention to the importance and desirability of investigation along certain lines intimately affecting the interests which the members represent."

The secretary presented the report of the executive committee, which report consisted of the minutes of the various meetings of the committee held during the past year on February 3, and 4, June 12 and 13, and September 26. On motion of Mr. W. B. Read, the report was accepted and ordered to be filed.

The secretary then presented his annual report. This report showed that the association in the past year had acquired 18 new members and had lost eight members; the total membership at present being 206 companies. The report of the treasurer showed the following financial transactions during the year: Receipts, $12,924.85; expenses, $6,192.65; balance on hand, $6,732.20.

The president stated that the next business would be the report of the committee on the reorganization of the association. As this was a very important matter it seemed proper that it should be presented in its entirety, so that all might understand thoroughly the great amount of work and thoughtful investigation that had been bestowed upon the question of reorganization.

The secretary then read the minutes of the various joint conferences between the representatives of the parent association and the allied organizations.

The president stated that the executive committee decided that it would be a good thing to secure the attendance at the meeting of Mr. Henry L. Doherty of the National Electric Light Association, who had been chiefly instrumental in bringing order out of chaos in the work of this association, and whose efforts had produced results which were very gratifying to the men in that branch of the business.

Mr. Doherty addressed the meeting and said that he had never realized so keenly the scope and perplexity of the street railway industry until faced with the responsibility of delivering an address upon the association work it demands; the wide scope of work not only dictated the necessity for wise planning of the individual company organization, but an equally wise and comprehensive organization of the association. The work in the street railway field required a knowledge of thermo-dynamics, mechanical engineering, electrical engineering, legal matters, materials, amusements, municipal engineering, and especially regarding paving, proper relations with State and municipal authorities, the newspapers and the general public. The association, to administer benefits to the fullest extent of its possibility, must be comprehensive and therefore probably complex and extensive.

At the conclusion of his remarks Mr. Doherty made several recommendations, based on many years' of experience in association work. He was tendered a vote of thanks.

The secretary then read the proposed constitution and by-laws of the "American Street and Interurban Association."

Several amendments were offered, but after a long discussion the new constitution and by-laws were adopted.

The committee on nominations of officers presented the following list of nominees:

For President—W. Caryl Ely, of Buffalo.

For First Vice-President—John I, Beggs, of Milwaukee.

For Second Vice-President—Calvin G. Goodrich, of Minneapolis.

For Third Vice-President—James F. Shaw, of Boston.

Under the new plan of organization the members of the executive committee are made up of the officers and the presidents of the allied organizations. President Ely announced the following members of the executive committee: Mr. H. H. Adams, of Baltimore, on behalf of the Mechanical Association; Mr. S. L. Rhodes, of Philadelphia, on behalf of the Claim Agents' Association, and Mr. Walter B. Brockway, on behalf of the Accountants' Association.

On motion, the report of the committee on nominations was accepted and the secretary authorized to cast the ballot of the association for the gentlemen named, which was accordingly done.

A committee of three was appointed on insurance and protection.

The first business of the meeting on Thursday morning was the reading of the paper on "Notes on the Design of Large

Gas Engines with Special Reference to Railway Work," by Mr. Arthur West, and the paper by Mr. J. R. Bibbins on "The Application of Gas Power to Electric Railway Service."

Both papers were discussed at the same time and claimed the attention of the members nearly all the forenoon.

At the afternoon session the papers on "The Single-Phase Railway System," by Mr. Charles F. Scott, and on "Electric Railway Equipment," by Mr. W. B. Potter, were read.

On motion of Mr. Harrington the following resolution was adopted: "That all regular standing committees of this association shall hereafter consist of three members."

Mr. Beggs, who was appointed chairman of the committee to prepare suitable resolutions with reference to the services of Mr. Thomas C. Penington as secretary and treasurer of the association, offered the following on behalf of the committee:

"Mr. Thomas C. Penington, who has been the secretary and treasurer of the American Street Railway Association for 10 years past, having severed his official relations because of the determination of the association to establish headquarters in the city of New York and the necessity of continuous attention to its affairs by the secretary; therefore, be it

"Resolved, that the American Street Railway Association does hereby record a minute of its earnest appreciation of Mr. Penington's fidelity to its interests, his devotion to its welfare and the eminently honest and satisfactory manner in which he has discharged the trusts imposed upon him.

"Mr. Penington's relations to the individual members of the American Street Railway Association have established friendships which will last through life, and they part with his services as an officer with the deepest regret and with a lasting appreciation of his kindly thought and attention to themselves and their friends during the many conventions which had been held under his able assistance."

The resolutions were unanimously adopted by a rising vote.

The president appointed as a committee on United States Mail Service the following named gentlemen: John I. Beggs, G. Tracy Rogers and P. F. Sullivan.

On motion of Mr. Bean the convention took a recess until Saturday afternoon (or until the last session of the Accountants' Association) when the convention adjourned sine die.

Street Railway Accountants' Association.

The ninth annual meeting of the Street Railway Accountants' Association was held September 28 and 29.

President W. G. Ross, in his annual address, carefully reviewed the discussion relative to the reorganization plans, and incorporated the remarks of himself and Mr. Henry at the joint conference held in New York last February.

Secretary White reported that 13 new members were received during the year and that the total membership is now 152.

On Friday morning the reports of committees and papers were taken up and discussed.

The usual resolutions of thanks were passed and the following named gentlemen were elected officers for the ensuing year:

President—Walter B. Brockway, Yonkers, N. Y.

First Vice-President—P. S. Young, Newark, N. J.

Second Vice-President—Robert N. Wallis, Fitchburg, Mass.

Third Vice-President—H. A. Ferrandau, New Orleans, La.

Secretary and Treasurer—Elmer M. White, Birmingham, Ala.

Executive Committee—W. G. Ross, Montreal, Can.; C. L. S. Tingley, Philadelphia, Pa.; F. Dabney, Seattle, Wash.; J. A. Pardee, Canandaigua, N. Y.

Advertising Committee Appointed.

President Blood, of the National Electric Light Association, has appointed Mr. Paul Spencer, of Philadelphia; Mr. John F. Gilchrist, of Chicago, and Mr. Joseph E. Montague, of Niagara Falls, as a committee to co-operate with the advertising committee of the American Association of Incandescent Lamp Manufacturers in the matter of assisting central stations in the adoption of advertising methods that will result in increased business. The lamp manufacturers' association made an offer to the National Electric Light Association, at the Denver meeting, of $10,000, to be expended for the above purpose, and the offer being accepted, this committee has been appointed to complete plans for the work.

A New Battery Company.

The Columbia Battery Company, located at State and Third streets, Milwaukee, Wis., is a recently organized concern for the purpose of manufacturing storage batteries for electric vehicles and electric launches, spark coil batteries, stationary lighting plants, electric bells, portable batteries, etc.

ELECTRICAL PATENT RECORD.

LETTERS PATENT ISSUED SEPT. 26, 1905.

Electric Railways and Appliances.

800,246-247. Railway Switching and Signaling Apparatus. John D. Taylor, Buffalo, N. Y., assignor to the Taylor Signal Company. Filed Feb. 24, 1902, and Jan. 22, 1904.

800,294. Trolley-Pole and Stand. William W. Hallenbeck, Burville, Conn. Filed Jan. 12, 1905.

800,355. Fender. John C. G. Bradley, Brooklyn, N. Y. Filed April 13, 1905.

800,376. Train-Lighting System. Sigvald Krohn, Berlin, Germany, assignor to the General Electric Company. Filed Jan. 21, 1905.

800,584. Trolley-Wire Coupling. Edward M. Leslie, Cincinnati, O., assignor to the Kingsland Kay-Cook Manufacturing Company, St. Louis, Mo. Filed Nov. 20, 1903.

Electrical Machinery and Apparatus

800,204. Circuit-Breaker. Charles H. Brigham, New York City, and John C. Francis, Weehawken, N. J.; said Francis assignor to said Brigham. Filed March 19, 1904.

800,241. Electric Hoisting Mechanism. James B. Phillips, Portland, Me. Filed March 27, 1905.

800,315. Circuit-Interrupter. George P. McDonnell, St. Louis, Mo., assignor to the American Electric Company, East Orange, N. J. Original application filed May 10, 1902. Divided and this application filed Aug. 5, 1903.

800,375. Load-Meter. Elton J. King, Fort Wayne, Ind., assignor to the General Electric Company. Filed Sept. 6, 1902.

800,382. Dynamo-Electric Machine. John P. Mallett, Madison, Wis., assignor to the Northern Electrical Manufacturing Company. Filed May 10, 1901.

800,394. Electromagnetic Power-Generator. Joseph L. Potter and Reinhold A. Miller, Indianapolis, Ind. Filed Dec. 31, 1904.

800,603. Magnetic-Clutch Mechanism. Harry A. Williams, Akron, O., assignor to the Williams Electric Machine Company, same place. Filed Feb. 14, 1905.

800,609. Electric Cut-out Switch. Nathan W. Crandall, Hartford, Conn., assignor, by mesne assignments, to the Perkins Corporation, same place. Filed Nov. 19, 1904.

800,611. Device for Controlling Motors. Frederick B. Duncan, Madison, Wis., assignor to the Northern Electrical Manufacturing Company. Filed Dec. 30, 1901.

Telephones and Telephone Apparatus

800,160. Multiple Switchboard for Telephone Exchanges. Milo G. Kellogg, Chicago, Ill., assignor to the Kellogg Switchboard & Supply Company. Filed Nov. 30, 1891

800,161. Switchboard for Multiple Exchanges. Milo G. Kellogg, Chicago, Ill., assignor to the Kellogg Switchboard & Supply Company. Original application filed Dec. 31, 1882. Divided and this application filed Aug. 24, 1893.

800,534. Secret-Service System for Interconnecting Telephone Lines. Albert K. Andriano and Hermann Herbstritt, San Francisco, Cal., assignors, by mesne assignments, to the Direct Line General Telephone Company. Filed Jan. 26, 1901.

Miscellaneous.

800,154-155-156-157-158. Telegraphy. Francis W. Jones, New York City. Filed Feb. 7, March 11, March 31, April 3, April 27, 1905.

800,170. Means for Securing Electric Conductors. Carroll Potter, Philadelphia, Pa. Filed Sept. 16, 1902.

800,179. Electric Signaling System. Howell W. Souder, Tamaqua, Pa., assignor of one-half to W. D. Zehner, Lansford, Pa. Filed Jan. 27, 1905.

800,370. Magnetic Separator. Charles M. Green, Lynn, Mass., assignor to the General Electric Company. Filed Oct. 17, 1901.

800,472. Alarm System. Felix McGloin, New York City, assignor to the Automatic Fire Alarm Company. Filed Dec. 31, 1902.

800,489. Electrical Vibrating and Massaging Device. Louis E. Richmond and Charles J. Graham, Cleveland, O. Filed April 10, 1905.

800,515. Incandescent Electrical Furnace. Frank J. Tone, Niagara Falls, N. Y. Filed Dec. 7, 1904.

800,547. Signal System. William B. Bruce, Gallatin, Tenn., assignor of one-half to himself and one-half to Martin A. Ewing and Joseph H. Ewing, same place. Filed Jan. 16, 1905.

800,586. Electrical Rosette. James A. Mebane, South Boston, Va. Filed Aug. 2, 1904.

THE TELEPHONE WORLD.

Independent Telephone Merger.

J. J. Heim, president of the Kansas City, Mo., Home Telephone Company, one of the biggest concerns interested in the United States Telegraph & Telephone Company, announces that the new corporation will not only be a competitor of the Bell Telephone Company, but will compete with the Western Union and Postal Telegraph Companies for telegraph business. Late improvements, he says, will enable the company to use its wires for both purposes, reducing cost of operation and affording cheaper service. He expects the inauguration of this double service will bring about coalition between the Bell, the Western Union and the Postal companies and a rate war.

Telephone Rates Advance.
